RULES
R001-2025

CHINA CLASSIFICATION SOCIETY

RULES FOR CLASSIFICATION OF SEA-GOING STEEL SHIPS

2025

Effective from 1 July 2025

Beijing

EXPLANATION

The Rules for Classification of Sea-going Steel Ships is the basic rules of CCS to provide classification services for sea-going ships engaged on international voyages, including classification conditions and scope and supporting technical requirements. The Rules specifies technical and construction standards, survey and test requirements for ship construction, hull structure, machinery and electrical equipment and systems, fire safety, environmental protection etc., as well as conditions to maintain them in good conditions, which are intended to control the safety and quality of ships to an appropriate level and receive wide recognition by the industry.

The Rules for Classification of Sea-going Steel Ships applies to classed sea-going ships of 20 m in length and over. Unless otherwise specified, it does not apply to military ships, wooden ships, non-commercial yachts, high-speed craft, small waterplane area craft, sailboat.

The Rules for Classification of Sea-going Steel Ships (2025) incorporates 2025 amendments to the Rules for Classification of Sea-going Steel Ships, 2024 RCN No.3, 2025 RCN No.1 and 2025 RCN No.2 related thereto, on the basis of the Rules for Classification of Sea-going Steel Ships (2024).

Upon effective, the Rules for Classification of Sea-going Steel Ships (2025) supersedes the Rules for Classification of Sea-going Steel Ships (2024).

CHINA CLASSIFICATION SOCIETY

RULES FOR CLASSIFICATION OF SEA-GOING STEEL SHIPS

2025

PART ONE PROVISIONS OF CLASSIFICATION

CONTENTS

CHAPTER 1 GENERAL 1-1
Section 1 CHINA CLASSIFICATION SOCIETY AND ITS MAIN SERVICES 1-1
Section 2 COUNCIL AND COMMITTEES 1-2
CHAPTER 2 SCOPE AND CONDITIONS OF CLASSIFICATION 1-3
Section 1 GENERAL PROVISIONS 1-3
Section 2 RULES FOR CLASSIFICATION 1-4
Section 3 CHARACTERS OF CLASSIFICATION AND CLASS NOTATIONS 1-6
Section 4 APPLICATION AND FEES 1-8
Section 5 SUBMISSION AND EXAMINATION OF PLANS 1-8
Section 6 CLASSIFICATION SERVICES 1-10
Section 7 STATUTORY SERVICES 1-10
Section 8 APPROVAL OF SUPPLIERS 1-11
Section 9 ASSIGNMENT, MAINTENANCE, SUSPENSION, CANCELLATION AND REINSTATEMENT OF CLASS 1-12
Section 10 CERTIFICATES AND REPORTS 1-15
Section 11 REGISTER OF SHIPS AND LISTS OF APPROVED MARINE PRODUCTS 1-15
Section 12 AVAILABILITY AND CONFIDENTIALITY OF INFORMATION 1-16
Section 13 LIABILITY, DISAGREEMENT AND ARBITRATION 1-18
Appendix 1 LIST OF CLASS NOTATIONS FOR SEA-GOING SHIPS 1-20
Appendix 2 DIAGRAMS OF MANDATORY SHIP TYPES FOR SHIPS HAVING ESP NOTATION 1-62
CHAPTER 3 INSPECTIONS OF PRODUCTS 1-65
Section 1 GENERAL PROVISIONS 1-65
Section 2 UNIT/BATCH INSPECTIONS 1-73
Section 3 DESIGN APPROVAL 1-76
Section 4 TYPE APPROVAL 1-77
Section 5 WORKS APPROVAL 1-80
Section 6 PRODUCT DRAWING EXAMINATION 1-82
Section 7 APPROVAL OF SERVICE FIRM OF INSPECTION AND TESTING 1-83
Section 8 CLASS NOTATIONS FOR PRODUCTS 1-85
Section 9 REQUIREMENTS FOR QUALITY SYSTEM CHECK 1-87
Section 10 ALTERNATIVE CERTIFICATION SCHEME 1-88
Section 11 PRINCIPLE APPROVAL 1-89
Appendix 1A LIST OF CERTIFICATION REQUIREMENTS FOR CLASSED MARINE PRODUCTS 1-93
Appendix 1B LIST OF CERTIFICATION REQUIREMENTS FOR STATUTORY MARINE PRODUCTS 1-101
Appendix 1C LIST OF CERTIFICATION REQUIREMENTS FOR LIFTING APPLIANCES 1-108
Appendix 1D LIST OF CERTIFICATION REQUIREMENTS FOR LIQUEFIED NATURAL GAS SPECIALIZED PRODUCTS 1-109
Appendix 1E LIST OF CERTIFICATION REQUIREMENTS FOR METHANOL FUEL SYSTEM SPECIALIZED PRODUCTS 1-116
Appendix 1F LIST OF CERTIFICATION REQUIREMENTS FOR AMMONIA TRANSPORT AND AMMONIA FUEL SPECIALIZED PRODUCTS 1-120
Appendix 2A LIST OF CERTIFICATION REQUIREMENTS FOR CLASSED MARINE PRODUCT PARTS 1-127
Appendix 2B LIST OF CERTIFICATION REQUIREMENTS FOR STATUTORY MARINE PRODUCT PARTS 1-144
Appendix 2C LIST OF CERTIFICATION REQUIREMENTS FOR LIFTING APPLIANCE PARTS 1-154
CHAPTER 4 SURVEYS DURING CONSTRUCTION 1-157

Section 1 GENERAL PROVISIONS 1-157
Section 2 SURVEYS AND TESTS 1-157
Section 3 TESTING PROCEDURES OF WATERTIGHT COMPARTMENTS 1-159
Section 4 DOCUMENTATION 1-168
Section 5 ASSIGNING CLASS FOR A NEW BUILDING PROJECT WHEN THE DESIGN IS ALREADY APPROVED BY AN INITIAL SOCIETY 1-169
Section 6 ASSIGNING DUAL CLASS FOR A NEW BUILDING 1-171
Appendix 1 HULL SURVEY FOR NEW CONSTRUCTION 1-172
Appendix 2 SHIPBUILDING AND REPAIR QUALITY STANDARD 1-201
Appendix 3 SURVEYS OF WATERTIGHT CABLE TRANSITS 1-247
CHAPTER 5 SURVEYS AFTER CONSTRUCTION 1-248
Section 1 GENERAL PROVISIONS 1-248
Section 2 TYPES AND PERIODS OF SURVEYS 1-275
Section 3 RETROSPECTIVE REQUIREMENTS FOR EXISTING SHIPS 1-278
Section 4 HULL AND EQUIPMENT SURVEYS 1-287
Section 5 ADDITIONAL REQUIREMENTS FOR HULL AND EQUIPMENT SURVEYS OF GENERAL DRY CARGO SHIPS 1-297
Section 6 ADDITIONAL REQUIREMENTS FOR HULL AND EQUIPMENT SURVEYS OF OIL TANKERS 1-305
Section 7 ADDITIONAL REQUIREMENTS FOR HULL AND EQUIPMENT SURVEYS OF BULK CARRIERS 1-319
Section 8 ADDITIONAL REQUIREMENTS FOR HULL AND EQUIPMENT SURVEYS OF CHEMICAL TANKERS 1-337
Section 9 SURVEYS OF MACHINERY 1-346
Section 10 SURVEYS OF ELECTRICAL INSTALLATIONS 1-352
Section 11 SURVEYS OF THE OUTSIDE OF THE SHIP'S BOTTOM AND RELATED ITEMS 1-354
Section 12 SURVEYS OF PROPELLER SHAFTS AND TUBE SHAFTS 1-355
Section 13 BOILER SURVEYS 1-363
Section 14 INITIAL CLASSIFICATION SURVEYS OF SHIPS CONSTRUCTED NOT UNDER THE SUPERVISION OF CCS 1-366
Section 15 OTHER SURVEYS 1-371
Section 16 ADDITIONAL REQUIREMENTS FOR HULL AND EQUIPMENT SURVEYS OF LIQUEFIED GAS CARRIERS 1-372
Section 17 ADDITIONAL REQUIREMENTS FOR SURVEYS OF RO-RO SHIPS 1-376
Section 18 ADDITIONAL REQUIREMENTS FOR SURVEYS OF LIVESTOCK CARRIERS 1-379
Appendix 1 CRITERIA FOR RENEWAL OF HULL STRUCTURAL MEMBERS 1-380
Appendix 2 CRITERIA FOR LONGITUDINAL STRENGTH OF HULL GIRDER FOR OIL TANKERS 1-383
Appendix 3 GUIDELINES FOR MEASURING SCANTLINGS OF THE TRANSVERSE WATERTIGHT VERTICALLY CORRUGATED BULKHEAD BETWEEN CARGO HOLDS NOS.1 AND 2 OF BULK CARRIERS 1-387
Appendix 4 RUDDER BEARING WEAR CLEARANCE 1-389
Appendix 5 WEAR CLEARANCE OF BEARINGS OF PROPELLER SHAFTS OR TUBE SHAFTS 1-391
Appendix 6 GUIDELINES FOR THE GAUGING OF SIDE SHELL FRAMES AND BRACKETS IN SINGLE SIDE SKIN BULK CARRIERS REQUIRED TO COMPLY WITH UR S31 1-392
Appendix 7 GUIDELINES FOR THE SURVEY OF VOYAGE REPAIRS 1-396
Appendix 8 PROCEDURAL REQUIREMENTS FOR SERVICE SUPPLIERS 1-398
Appendix 9 CALIBRATION OF MEASURING EQUIPMENT 1-419
Appendix 10 PROCEDURES FOR CERTIFICATION OF FIRMS ENGAGED IN THICKNESS MEASUREMENT OF HULL STRUCTURES 1-420
Appendix 11 ESP SURVEY REPORTING PRINCIPLES 1-421

Appendix 11A SURVEY PROGRAMME 1-434
Appendix 11B SURVEY PLANNING QUESTIONNAIRE 1-439
Appendix 12 GUIDELINES FOR TECHNICAL ASSESSMENT IN CONJUNCTION WITH PLANNING FOR ENHANCED SURVEYS AND OWNER'S INSPECTION REPORT 1-443
Appendix 13 RECOMMENDED PROCEDURES FOR THICKNESS MEASUREMENTS 1-451
Appendix 14 GUIDELINES FOR SCREWSHAFT CONDITION MONITORING SYSTEM ... 1-611
Appendix 15 GUIDELINES FOR LUBRICATING OIL CONDITION MONITORING SYSTEM OF DIESEL ENGINES 1-623
Appendix 16 GUIDELINES FOR SURVEY OF PLANNED MAINTENANCE SCHEME（PMS） FOR MACHINERY 1-632
Appendix 17 S19 EVALUATION OF SCANTLINGS OF THE TRANSVERSE WATERTIGHT CORRUGATED BULKHEAD BETWEEN CARGO HOLDS NOS. 1 AND 2, WITH CARGO HOLD NO. 1 FLOODED, FOR EXISTING BULK CARRIERS 1-652
Appendix 18 S22 EVALUATION OF ALLOWABLE HOLD LOADING OF CARGO HOLD NO.1 WITH CARGO HOLD NO.1 FLOODED, FOR EXISTING BULK CARRIERS 1-664
Appendix 19 S23 IMPLEMENTATION OF IACS UNIFIED REQUIREMENTS S19 AND S22 FOR EXISTING SINGLE SIDE SKIN BULK CARRIERS 1-668
Appendix 20 S31 RENEWAL CRITERIA FOR SIDE SHELL FRAMES AND BRACKETS IN SINGLE SIDE SKIN BULK CARRIERS AND SINGLE SIDE SKIN OBO CARRIERS NOT BUILT IN ACCORDANCE WITH UR S12 REV.1 OR SUBSEQUENT REVISIONS 1-670
Appendix 21 GUIDELINES FOR PILOT SCHEMES OF EXTENDED INTERVAL BETWEEN SURVEYS IN DRY-DOCK − EXTENDED DRY-DOCKING (EDD) SCHEME .. 1-680
Appendix 22 CONDITION MONITORING AND CONDITION BASED MAINTENANCE ... 1-683
Appendix 23 REQUIREMENTS FOR NDT SERVICE SUPPLIERS 1-687
Appendix 24 REMOTE CLASSIFICATION SURVEYS 1-691
CHAPTER 6 SURVEYS RELATED TO CLASS NOTATIONS 1-700
Section 1 GENERAL PROVISIONS 1-700
Section 2 SURVEYS RELATED TO CLASS NOTATIONS FOR SPECIAL DUTIES 1-700
Section 3 SURVEYS RELATED TO CLASS NOTATIONS FOR SPECIAL EQUIPMENT AND SYSTEM 1-705
Section 4 SURVEYS RELATED TO CLASS NOTATIONS FOR AUTOMATIC CONTROL ... 1-708
Section 5 SURVEYS RELATED TO CLASS NOTATIONS FOR GREEN ECO-SHIPS 1-709
Section 6 SURVEYS RELATED TO CLASS NOTATIONS FOR REFRIGERATED CARGO INSTALLATIONS 1-709
Section 7 SURVEYS RELATED TO CLASS NOTATIONS FOR EOM 1-712
Appendix 1 REQUIREMENTS FOR INSTALLATION OF FLOWMETER 1-715
Appendix 2 SUMMARY OF PARAMETERS OF ENERGY EFFICIENCY EQUIPMENT 1-717
Appendix 3 CHECKLIST OF SYSTEM FUNCTIONS OF EOM SOFTWARE 1-721

CHAPTER 1 GENERAL

Section 1 CHINA CLASSIFICATION SOCIETY AND ITS MAIN SERVICES

1.1.1 Classification Societies

1.1.1.1 Classification societies are independent and impartial organizations that undertake classification services for ships and offshore installations. Classification societies have no commercial interests related to design, building, ownership, operation, management, maintenance or repairs, financing, insurance or chartering of ships and offshore installations.

1.1.1.2 Classification societies work for the safety of ships and offshore installations and environmental protection, and make a unique contribution to maritime safety and the development of classification rules through technical support, compliance verification and research and development. Classification societies provide classification services, statutory services and other services for clients in accordance with the classification rules published by them.

1.1.1.3 Classification societies furnish reasonable standards – the classification rules, which are generally accepted and recognized, for ships, shipbuilding, marine exploitation and related manufacturing industries as well as insurance, financing and other related sectors, carry out plan approval in ship design and surveys during and after construction so as to ascertain that ships are in compliance with the requirements of the classification rules, and issue classification certificates independently, in accordance with such rules.

1.1.1.4 When authorized by the Government of the flag State, classification societies carry out statutory services in accordance with the requirements of the Government of the flag State with a view to ascertaining the ships' compliance with the requirements of international conventions and/or relevant regulations of the flag State, and issue statutory certificates.

1.1.2 China Classification Society

1.1.2.1 China Classification Society (hereinafter referred to as CCS) is a specialized technical organization, authorized under the relevant laws of China and registered in accordance with the laws for providing classification services and statutory services for ships and offshore installations.

1.1.2.2 CCS mainly undertakes classification services, certification surveys and surveys relating to notarial matters for ships, offshore installations, containers and the related industrial products both at home and abroad, and performs specific services such as statutory services, etc., on behalf of the Chinese Government and the governments of foreign countries or regions when so authorized, and other services approved by the relevant administrations.

1.1.3 Objectives

1.1.3.1 The objectives of CCS are, by furnishing reasonable and reliable technical rules for ships, offshore installations, containers and related industrial products and conducting in an independent, impartial and honest manner classification, certification and technical services, to provide services for the shipping, marine exploitation and related manufacturing industries as well as marine insurance, for the promotion of safety of life and property on waters and for the protection of marine environment and other environments.

1.1.4 Main services

1.1.4.1 The services of CCS are mainly as follows:

(1) Classification services for ships, offshore installations and related industrial products (including containers): development and maintenance of rules, plan approval, surveys and certification;

(2) Statutory services for ships, offshore installations and related industrial products, when so authorized: development of technical regulations for statutory surveys, plan approval, surveys and certification;

(3) Surveys and certification delegated by other ship survey organizations, surveys related to notarial matters and safety assessment as well as verification surveys and certification of ships and offshore installations , and investigation of major maritime safety accidents;

(4) Verification, surveys and certification of related industrial facilities and products used on land, and surveys and certification delegated by foreign ship survey organizations for marine facilities and products as well as related industrial facilities and products used on land;

(5) ISM audit and certification;

(6) ISPS audit and certification;

(7) Maritime Labor Convention (MLC) inspection and certification;
(8) Services for EU Regulations on the monitoring, reporting and verification (MRV) of CO_2 emissions from maritime transport and IMO Data collection system for fuel oil consumption of ships (DCS);
(9) Survey and assessment of ship's technical conditions;
(10) Certification of quality management systems and environmental management systems in accordance with ISO 9000 and ISO 14000 series or equivalent standards;
(11) Technical research for classification of ships and offshore installations, safety on waters and environmental protection, survey of marine facilities and products as well as related industrial facilities and products used on land, and research on the application of information technology;
(12) Other services.

Section 2 COUNCIL AND COMMITTEES

1.2.1 Council

1.2.1.1 The Council of CCS is composed of the representatives from Government departments concerned, CCS, shipping, shipbuilding, marine exploitation and related manufacturing industries as well as insurance, financing and other related sectors.
1.2.1.2 The Council is entitled to:
(1) develop and update the Articles of Association of CCS;
(2) consider the work report of CCS;
(3) decide on other major issues of CCS.

1.2.2 Technical Committee

1.2.2.1 The Technical Committee of CCS is composed of the persons in charge of technical work from Government departments concerned, CCS, shipping, shipbuilding and marine exploitation industries, design institutes, universities, research institutes and related manufacturing industries. Specialized subcommittees may be set up as appropriate.
1.2.2.2 The Technical Committee is entitled to:
(1) make comments or recommendations on CCS technical policy and development plan for rules and research;
(2) review and approve the main technical rules developed by CCS for ships and offshore installations;
(3) organize technical analysis and investigation of major accidents of the ships and offshore installations classed with CCS;
(4) make recommendations on developing and amending the rules based on experience in application, market demand and development in science and technology;
(5) examine the major research achievements intended to be incorporated into CCS rules for ships and offshore installations, and make recommendations on such incorporation.

1.2.3 Class committee

1.2.3.1 The Class Committee of CCS is composed of the representatives from Government departments concerned, CCS, owners, oil companies, administrations as well as insurance, financing, law and other related sectors.
1.2.3.2 The Class Committee is entitled to:
(1) examine and adopt the working procedure of the Committee and the procedure for CCS classification management;
(2) examine the relevant provisions of CCS for classification of ships and offshore installations and make recommendations on modifications and additions in light of the latest development in science and technology;
(3) accept and confirm the reports submitted by CCS on assignment, suspension, cancel or reinstatement of class of ships and offshore installations;
(4) make comments on the certificates and various survey documents of ships and offshore installations.

CHAPTER 2 SCOPE AND CONDITIONS OF CLASSIFICATION

Section 1 GENERAL PROVISIONS

2.1.1 Principle of classification

2.1.1.1 Classification is a representation by CCS, in accordance with its rules, that the structural strength and integrity of essential parts of the ship's hull and its appendages, and the reliability and the function of the propulsion and steering systems, power generation and those other features and auxiliary systems which have been built into the ship, identified by various characters and notations, are sufficient for maintaining essential services on board.

2.1.2 Process of classification

2.1.2.1 The process of classification consists of:

(1) the development of rules;

(2) the plan approval and survey during construction to verify compliance with such rules;

(3) the assignment of class and issuance of a classification certificate when such compliance has been verified;

(4) the endorsement or issuance of a classification certificate by survey after construction to verify compliance with such rules; and

(5) the application of information.

2.1.3 Definitions

2.1.3.1 Unless expressly provided otherwise, for the purpose of the Rules:

(1) **Classification** means the technical service provided by a classification society to clients in accordance with the rules published by it.

(2) A **classed ship** is a ship to which a classification certificate is issued by a classification society in accordance with its rules.

(3) A **non-classed ship** is any ship which is not classed.

(4) A **convention ship** is a ship holding an international certificate issued according to a relevant international convention.

(5) A **non-convention ship** is any ship which is not a convention ship.

(6) **Unrestricted service** means that the areas for navigation are not limited.

(7) **Restricted service** is a generic term of the service categories 1, 2 and 3 as shown in table 2.1.3.1 below:

Table 2.1.3.1

Category	Limitation for navigation	
	Distance to land (n mile)	
Service category 1	200 (summer/tropical*)	100 (winter*)
Service category 2	20 (summer/tropical*)	10 (winter*)
Service category 3	Sheltered waters**	

Notes:

* Seasonal areas as specified in Annex II to the International Convention on Load Lines, 1966.

** Sheltered waters include the sea areas between an island and the shore and between islands with a distance of less than 10 n miles in between, which forms a comparatively good sheltered or similar condition with a little wave.

(8) **National waters** mean the waters of a flag State, as specified by the Government of that State.

(9) **Specified route service** means the service between two or more designated ports.

(10) A **passenger** is every person other than the master and the members of the crew or other persons employed or engaged in any capacity on board a ship on the business of that ship; or a child under one year of age.

(11) A **passenger ship** is a ship which carries more than twelve passengers.

(12) A **ro-ro passenger ship** is a passenger ship with ro-ro cargo spaces or special category spaces.

(13) A **cargo ship** is any ship which is not a passenger ship.

(14) A **tanker** is a cargo ship which is constructed primarily to carry liquid cargoes in bulk.

(15) **Oil** means petroleum in any form including crude oil, fuel oil, sludge, oil refuse and refined products (other than those petrochemicals which are subject to the provisions of MARPOL Annex II).

(16) An **oil tanker** is a ship which is constructed primarily to carry oil in bulk and includes ship types such as combination carriers (ore/oil ships etc.).

(17) A **ro-ro ship** is a ship which utilizes a loading ramp to enable wheeled vehicles to be rolled on and

rolled off the ship.
(18) A **container ship** is a ship constructed for the carriage of containers in holds and on deck.
(19) A **fishing vessel** is a vessel used for commercially catching fish or other living resources of the sea.
(20) A **chemical tanker** is a cargo ship constructed for the carriage in bulk of any liquid products listed in Chapter 17 of the International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk (IBC Code). The provisions of the Code are contained in CCS Rules for Construction and Equipment of Ships Carrying Dangerous Liquid Chemicals in Bulk.
(21) A **liquefied gas carrier** is a cargo ship constructed for the carriage in bulk of any liquefied gas or other products listed in Chapter 19 of the International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk (IGC Code). The provisions of the Code are contained in CCS Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk.
(22) A **bulk carrier** is a ship which is constructed generally with single deck, double bottom, topside tanks and hopper side tanks in cargo spaces, and is intended primarily to carry dry cargo in bulk. Combination carriers are included. Common Structural Rules[①] does not apply to ore carriers and combination carriers.
(23) A **new ship** means a ship contracted for construction on or after the date of entry into force of the Rules.
(24) An **existing ship** means a ship which is not a new ship.
(25) **Product** is a generic term of materials, equipment and systems.
(26) The term **rules** is a generic term of the classification rules, special rules, guidelines and computer software released by CCS.
(27) **Force majeure** means damage to the vessel; unforeseen inability of CCS Surveyors to attend the vessel due to the governmental restrictions on right of access or movement of personnel; unforeseeable delays in port or inability to discharge cargo due to unusually lengthy periods of severe weather, strikes, civil strife; acts of war, or other cases of force majeure.
(28) **Exceptional circumstances** mean one or more of the following cases:
① unavailability of dry-docking facilities;
② unavailability of repair facilities;
③ unavailability of essential materials, equipment or spare parts;
④ delays incurred by action taken to avoid severe weather conditions.
(29) A **double classed ship** is one which is classed by two Societies and where each Society works as if it is the only Society classing the ship, and does all surveys in accordance with its own Rules, requirements and schedule.
(30) A **dual class ship** is one which is classed by two Societies. These Societies have a written bilateral agreement that outlines sharing of work, including a working plan, and procedures and, in case of newbuilding, a written trilateral agreement with the shipyard.
(31) **Bilateral Agreement** is an agreement adopted by the two Societies with Dual Class Vessels.
(32) **Trilateral Agreement** is an agreement adopted by the shipyard and the two Societies involved in dual class arrangement (first Society and second Society) for describing the responsibilities between the two Societies during new construction of a vessel.
(33) **First Society** is a Society classing a vessel which, under request of the Owner, enters a double or dual class arrangement with another Society.
(34) **Second Society** is a Society which is requested by an Owner to accept a vessel already classed, or to be classed, by another Society into its class under double or dual class arrangement.
(35) **Conditions of class** are requirements to the effect that specific measures, repairs, surveys etc., are to be carried out within a specific time limit in order to retain class.
(36) A **CSR ship** is a ship complying with the requirements of Common Structural Rules[①].
(37) The term "**not in class (disclassed)**" means class being suspended or canceled (withdrawn).
(38) **Critical structural areas** are locations which have been identified from calculations to require monitoring or from the service history of the subject ship or from similar or sister ships (if available) to be sensitive to cracking, buckling or corrosion which would impair the structural integrity of the ship.

Section 2 RULES FOR CLASSIFICATION

2.2.1 Basis for classification

① PART TEN of the Rules (2012 version) and its 2013 and 2014 amendments or PART NINE of the Rules (2015 version) and its subsequent versions (including amendments).

2.2.1.1 “Classification rules” are such provisions that have entire content comprising conditions and scope of classification and supporting technical requirements. The aim of the rules is to ensure the safety and quality to be controlled to an appropriate level, and to be generally acknowledged.
2.2.1.2 The rules and relevant applicable guidelines published by CCS are the basis and criteria for classification.
2.2.1.3 CCS rules stipulate the scantlings of hull structures and essential machinery, the quality and structure of material employed, the standards of machinery manufacturing, requirements for classification and tests as well as maintenance conditions.
2.2.1.4 “Special rules” are such provisions that have special content and will be used in combination with the classification rules.
2.2.1.5 For those not covered in CCS present rules, or the principled requirements therein which need to be further defined in details, or where specific applicability of the rules is needed, or for novel ships or equipment or systems, CCS will develop appropriate guidelines or use IACS Recommendations① to facilitate classification. Where any “guidelines” or IACS Recommendations are referred to in the rules, the paragraphs related to classification in such “guidelines” or IACS Recommendations constitute requirements of the rules.
2.2.1.6 CCS COMPASS computer software system covers structural calculation and evaluation, ship characteristics, calculation of shafting vibration and strength and calculation of short-circuit current. The computer software plays an essential role in plan approval and surveys during and after construction.

2.2.2 Rules development

2.2.2.1 The main input for development of the rules is as follows:
(1) experience in application;
(2) relevant scientific theories and research findings;
(3) the applicable part of the relevant conventions, codes and resolutions adopted by IMO (International Maritime Organization), and unified requirements by IACS (International Association of Classification Societies).
2.2.2.2 The drafts of CCS rules or their amendments will be distributed to the Administration, CCS, shipping, shipbuilding, design institutes, universities, research institutes and related manufacturing industries related to ships and marine products for comments.
2.2.2.3 The drafts of CCS rules or their amendments are to be further supplemented and improved based on analysis of the expert comments or recommendations from the above-mentioned sources, followed by a final review by CCS Technical Committee or its subcommittee(s), and then issued after being approved and signed by CCS President.
2.2.2.4 Where any part of CCS rules related to the classification needs to be amended, as shown by experience in application, safety aspects covered by investigation of accidents, or due to entry into force of relevant resolutions, codes, etc., of IMO, or upon acceptance of unified requirements adopted by IACS, CCS will directly publish amendments thereto.

2.2.3 Entry into force of rules

2.2.3.1 Unless stated otherwise, the rules (including their amendments) will generally come into force in 3 months after being published. The effective date will be indicated on the first page of the corresponding PART or on the title page of the publication.
2.2.3.2 Unless stated specially, the rules are applicable to newbuildings and new marine products.
2.2.3.3 With the consent of the shipyard and the owner, the requirements of the new rules may be adopted for the ship under construction; and where the requirements in the new rules are reasonable and practicable, CCS may agree that these requirements be adopted for the ship under construction. In any case, this is to be indicated in the corresponding technical documents.
2.2.3.4 The date of entry into force of the rules is subject only to the date of approval for publishing the rules, not to the date of entry into force of any other statutory requirements.

2.2.4 Application

2.2.4.1 The Rules apply to classed sea-going ships.
2.2.4.2 The Rules apply to new ships. All ships constructed before the date of entry into force of the Rules are to continue to comply with the requirements previously applicable to them.
For ships which have undergone modification of a major character, the modified and related portions are to comply with the new Rules. The previous Rules are still applicable to those ships of which the midship

① IACS Recommendations are available on IACS website: http://iacs.org.uk.

section plan or an equivalent structural plan has been approved.
2.2.4.3 The requirements of relevant chapters in this PART also apply to existing ships, including chemical tankers and liquefied gas carriers.
2.2.4.4 The intact stability, subdivision and damage stability, fire safety are the conditions of classification of ships and are to comply with PART TWO and PART SIX of the Rules (while for fishing vessels, provisions of Chapter 5 of PART EIGHT of the Rules are to be complied with; for ships in restricted service, provisions of PART TEN of the Rules are to be complied with), with attention being paid to the relevant requirements of the flag Administration, if any.
2.2.4.5 Chemical tankers and liquefied gas carriers are also to comply respectively with CCS Rules for Construction and Equipment of Ships Carrying Dangerous Liquid Chemicals in Bulk and Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk.
2.2.4.6 Unless otherwise specially required, materials and welding are to comply with CCS Rules for Materials and Welding.
2.2.4.7 The Rules, unless expressly provided otherwise, do not apply to:
(1) military vessels;
(2) wooden ships;
(3) pleasure yachts not engaged in trade;
(4) high speed craft;
(5) small waterplane area craft;
(6) sailing boats;
(7) ships of less than 20 m in length.

2.2.5 Equivalent and exemption
2.2.5.1 Any ship which embodies structure and features of a novel kind may be exempted from any requirement of CCS rules if the application of which might seriously impede the incorporation of its features or its service, subject to agreement of CCS Headquarters.
2.2.5.2 Any fitting, material, appliance or apparatus, other than that required in CCS rules, may be allowed to be fitted in a ship, if it is satisfied by trial thereof or otherwise that such fitting, material, appliance or apparatus is at least as effective as that required in CCS rules.
2.2.5.3 Equivalence or substitution to those methods of calculation, criteria of evaluation, manufacturing procedures, materials, survey and test requirements specified by CCS rules may be accepted subject to agreement of CCS Headquarters, when relevant tests, theoretical basis or experience in application is provided, or recognized effective standards are available.

2.2.6 References in the Rules
2.2.6.1 References to relevant documents in the Rules constitute requirements of the Rules. For references with no date indication, their latest version applies to the Rules.

2.2.7 Qualification of new technology applications
2.2.7.1 For the qualification of new technology products and relevant technology solutions that lack specific technical requirements and relevant criteria in the rules and relevant recognized standards, refer to CCS Guidelines for Qualification of New Technology Applications.

Section 3 CHARACTERS OF CLASSIFICATION AND CLASS NOTATIONS

2.3.1 Characters of classification
2.3.1.1 Characters of classification are indicative of main features of the ship and mandatory.
2.3.1.2 The hull (including equipment) and machinery (including electrical installations) of a ship that comply with CCS rules, guidelines or equivalent provisions will be assigned appropriate characters of classification and class notations by CCS.
2.3.1.3 The hull (including equipment) and machinery (including electrical installations) of a ship that are classed with CCS will be assigned one of the following characters of classification as appropriate according to different conditions:

★ CSA

★ CSM

or

★ CSA
★ CSM
or
★ CSA
★ CSM

The meanings of the characters of classification are:

★ CSA — indicating that the ship's hull structure and equipment have been constructed with plan approval by and under the supervision of CCS and comply with CCS rules. Under special circumstances, the ship's hull structure and equipment have been found upon classification survey by CCS to be in compliance with rules which is at least as effective as that required in CCS rules shortly before delivery of the ship, ★ is replaced by $\overline{★}$;

★ CSA — indicating that the ship's hull structure and equipment have been constructed not with plan approval by and not under the supervision of CCS, and that they have been found upon classification survey by CCS to be in compliance with CCS rules;

★ CSM — indicating that the ship's propulsion and essential auxiliary machinery have been inspected by CCS, and that its machinery and electrical installations have been constructed with plan approval by and under the supervision of CCS and comply with CCS rules. Under special circumstances, the ship's machinery (including electrical installations) have been found upon classification survey by CCS to be in compliance with rules which is at least as effective as that required in CCS rules shortly before delivery of the ship, ★ is replaced by $\overline{★}$;

★ CSM — indicating that the ship's propulsion and essential auxiliary machinery have not been inspected by CCS, and that its machinery and electrical installations have been constructed with plan approval by and under the supervision of CCS and comply with CCS rules;

★ CSM — indicating that the ship's machinery and electrical installations have been constructed not with plan approval by and not under the supervision of CCS, and that they have been found upon classification survey by CCS to be in compliance with CCS rules.

2.3.2 Class notations

2.3.2.1 Class notations indicate different features of a ship in sequence, and will be appended to the characters of classification. Class notations may be divided into necessary notations and optional ones.

2.3.2.2 At the request of the owner and upon plan approval and surveys by CCS, optional class notation(s) will be assigned by CCS if it is satisfied that the relevant requirements of CCS rules are complied with.

2.3.2.3 One or one group class notations may be assigned to indicate ship type, cargo and loading characteristics, special duties, special features, service, service restriction or other meanings.

2.3.2.4 At the request of the owner, CCS will append appropriate class notations to the hull, machinery and electrical installations for ships built in accordance with the relevant rules published by CCS or other acceptable standards.

2.3.2.5 Appendix 1 of this Chapter contains a list of class notations for sea-going ships and such notations may be entered only in English into classification certificates. The list is divided into the following tables:

Table A: Type notation: For all ships, the type notation is to be added;

Table B: Special duties notation: Ships, which have been designed and constructed in accordance with relevant rules and guidelines for their special purposes, may be assigned appropriate notations respectively;

Table C: Service or service restriction notations: Ships, the service of which is restricted within a specified area or to a specified route due to certain reasons, may be assigned appropriate notations respectively;

Table D: Notation of cargo and loading characteristics: Ships, which have been constructed in accordance with particular rules to carry one or more particular cargoes, may be assigned appropriate notations respectively;

Table E: Special features notations: Ships, which incorporate special features significantly affecting the design, may be assigned appropriate notations respectively, of which the ice service notations Ice Class B1*, Ice Class B1, Ice Class B2, Ice Class B3 correspond respectively to IA Super, IA, IB, IC in the Finnish-Swedish Ice Class Rules;

Table F: Automation notation: Automatic and remote controls, dynamic positioning systems, one man bridge operated ships, etc., may be assigned appropriate notations respectively;

Table G: Special equipment and system notation: Where a relevant device or instrument for special

purposes has been installed, appropriate notations may be assigned respectively; for ships of which the longitudinal strength calculation is required, the relevant loading guidance is to be included in the loading manual provided to the master and/or the loading computer, if fitted. The system of the onboard loading computer is, if assigned a relevant notation for longitudinal strength calculation or stability evaluation or both, to be verified according to CCS longitudinal strength calculation programme and stability evaluation programme;

Table H: Special survey notation: For alternative methods or special requirements of survey, appropriate notations may be assigned respectively; self-propelled oil tankers, oil/bulk carriers, oil/bulk/ore carriers, chemical tankers and bulk carriers are subject to an enhanced survey programme; structural diagrams are given in Appendix 2 of this Chapter for mandatory ship types to which the ESP is assigned;

Table I: Environmental protection notation: Ships complying with the relevant requirements of CCS rules may be assigned appropriate notations;

Table J: Refrigerated cargo installation notation: Ships fitted with a refrigerating plant for carrying refrigerated cargo and ships carrying refrigerated containers in holds may be assigned appropriate notations respectively.

Section 4 APPLICATION AND FEES

2.4.1 Application

2.4.1.1 Applicants requesting services from CCS are to submit a written application or a completed application form to CCS or one of its local branches or the units designated by it, and/or sign a contract/agreement with CCS.

2.4.1.2 The responsibilities of both parties, characters of classification and class notations, particulars of the ship, etc., are to be clearly specified in the application or contract/agreement. Submitting the application or signing the contract/agreement means that the applicant will have no objection that the representative(s) of third-party independent audit organizations, e.g. representative(s) of an Accredited Certification Body (ACB), IACS observer(s), etc., and the representative(s) of the European Commission (EC), representative(s) of the flag State, assessor(s) of the Entity for the Quality Assessment and Certification of Organisations Recognised by the European Union(QACE), IMO observer(s) and representative(s) of IACS QSCS (Quality System Certification Scheme) Advisory Committee (AVC) may visit onboard or a manufacturer or a shipyard to carry out an audit or an assessment as provided in Article 8(1) of Regulation (EC) No. 391/2009, and will facilitate such audit/assessment.

2.4.1.3 Applicants are to submit plans and technical documents necessary for the requested services.

2.4.1.4 CCS has established an Occupational Health and Safety Management System for the purpose of guaranteeing the occupational health and safety of Surveyors. An application for any classification or statutory survey service by CCS means that the applicant respects this system of CCS and that he is committed to provide conditions for the safety of CCS Surveyors entering the facilities related to the requested survey service in accordance with the national requirements of the State of nationality of the Surveyor and the State where the survey unit is located and/or the technical safety requirements developed by the local competent authorities or equivalent technical standards①, including permanent or temporary means of access and facilities for inspections, compartment environment and safety precautions. CCS Surveyors will confirm the safety of survey conditions with the applicant and persons designated by him prior to performing specific surveys.

2.4.2 Fees

2.4.2.1 Applicants are to pay survey fees, traffic fees and other necessary expenses in accordance with CCS Provisions of Survey Fees and/or the contract/agreement.

2.4.2.2 For any service provided beyond the contract/agreement or any service provided anew due to the reasons on the part of the party receiving such service, CCS has the right to charge additional fees from the applicant.

Section 5 SUBMISSION AND EXAMINATION OF PLANS

2.5.1 General requirements

① Refer to CCS Guidelines for Site Safety of Survey.

2.5.1.1 For new ships of which the plan approval is requested on or after 1 January 2005, the applicant is to provide the appropriate "date of contract for construction".

2.5.1.2 Date of "contract for construction" is defined as follows:

(1) The date of "contract for construction" of a ship is the date on which the contract to build the ship is signed between the prospective owner and the shipbuilder. This date and the construction numbers (i.e. hull numbers) of all the vessels included in the contract are to be declared to CCS by the party applying for the assignment of class to a newbuilding.

(2) The date of "contract for construction" of a series of ships, including specified optional ships for which the option is ultimately exercised, is the date on which the contract to build the series is signed between the prospective owner and the shipbuilder.

For the purpose of this requirement, ships built under a single contract for construction are considered a "series of ships" if they are built to the same approved plans for classification purposes. However, ships within a series may have design alterations from the original design provided:

① such alterations do not affect matters related to classification; or

② if the alterations are subject to classification requirements, these alterations are to comply with the classification requirements in effect on the date on which the alterations are contracted between the prospective owner and the shipbuilder or, in the absence of the alteration contract, comply with the classification requirements in effect on the date on which the alterations are submitted to CCS for approval.

The optional ships will be considered part of the same series of ships if the option[①] is exercised not later than 1 year after the contract to build the series was signed.

(3) If a contract for construction is later amended to include additional ships or additional options, the date of "contract for construction" for such ships is the date on which the amendment to the contract is signed between the prospective owner and the shipbuilder. The amendment to the contract is to be considered as a "new contract" to which (1) and (2) above apply.

(4) If a contract for construction is amended to change the ship type, the date of "contract for construction" of this modified ship, or ships, is the date on which revised contract or new contract is signed between the owner, or owners, and the shipbuilder.

2.5.2 Examination of plans and documents

2.5.2.1 Prior to commencement of construction of the ship, the applicant is to submit the application together with the plans and documents in triplicate according to the relevant requirements of the Rules to a plan approval unit designated by CCS for examination. Where the plans will be submitted in batches, at least the necessary hull plans and documents are to be submitted first.

Copies of the plans to be submitted for approval for a series of ships or ships to be additionally constructed within one year in accordance with the approved main structural plans may be reduced or such submission exempted according to the specific conditions.

2.5.2.2 The ship's list of survey and test items, as well as the technical documents, such as welding procedure, welding specifications, NDT diagrams, installation procedure of machinery (excluding reasonable alignment of shafting), inclination testing programme, and mooring test and sea trial programme, are to be submitted to CCS attending Surveyors for examination. CCS plan approval units are responsible for examining welding specifications for CSR ships.

2.5.2.3 Necessary scantlings and relevant data as required by the Rules are to be indicated on the plans and documents submitted.

2.5.2.4 The term "approval" means that the plans and documents have been examined and found in compliance with CCS rules. The approval of plans and documents by CCS covers only the items as required by CCS rules, excluding any items not required by CCS rules. Where CCS undertakes statutory surveys at the same time, the "approval" by CCS is to cover the items related to the statutory requirements.

2.5.2.5 The plans and documents as deemed to comply with the Rules upon examination, are to be stamped with APPROVED seal. The approval conditions and restrictions may be written on the plans and documents, or stated in the plan approval letters with appropriate notes being added on the plans and documents.

2.5.2.6 The term "Used for information" means that the plans and documents have been examined and only used as supporting information to the approval of other relevant plans and documents.

2.5.3 Validity of approved plans

---

① The "option" means that an option for building additional ships to the same approved plans is given in the contract for construction signed between the owner and the shipbuilder.

2.5.3.1 The approved plans are valid only for construction in the designated shipyard, the construction project number or the number of ships to be constructed as specified in the application or contract/agreement for plan approval.
2.5.3.2 The approved plans for classification purposes will be invalid automatically in one of the following cases:
(1) after 4 years since the approval date of plans, except for ships for which commencement of construction has begun;
(2) after 1 year since the approval date of sectional plans of newbuildings where the entry into force of new rules including their amendments affects such plans;
(3) the construction of the ship(s) for the project number or the number of ships as specified in the application or contract/agreement for plan approval has been completed;
(4) the approved shipyard or construction project number has been changed, or the number of ships constructed is exceeded;
(5) the ship is not constructed under the supervision of CCS.
2.5.3.3 Where the statutory requirements of the flag State or the international conventions, codes accepted by it and the entry into force of the amendments thereto affect the validity of the approved plans, the approved statutory plans will be invalid automatically.

Section 6 CLASSIFICATION SERVICES

2.6.1 General requirements
2.6.1.1 Ship designers are to establish an appropriate quality assurance system for the design quality of ships and products.
2.6.1.2 Shipyards and manufacturers are to establish an appropriate quality assurance system for the construction and manufacturing quality of ships and products. They are also to provide a list of their suppliers and general documentation (e.g. brief introduction, information on quality management system).
2.6.1.3 Suppliers providing essential services to the ship, such as measurements, tests or maintenance of safety systems and equipment, the results of which will be used by CCS as the basis for survey, are subject to approval by CCS (see Section 8 of this Chapter). Otherwise such services are to be performed in the presence of the Surveyor.

2.6.2 Assessment and examination prior to commencement of construction
2.6.2.1 Prior to commencement of construction of the ship, CCS will send its Surveyors to assess the capability of the shipyards and manufacturers, and/or carry out an examination prior to commencement of construction.

2.6.3 Surveys
2.6.3.1 For the materials, equipment, systems and other products required by the Rules, product survey by CCS are to be requested in accordance with Chapter 3 of this PART.
2.6.3.2 For the ships intended to be classed with CCS, initial classification surveys by CCS are to be requested in accordance with the relevant requirements of Chapters 4 and 5 of this PART.
2.6.3.3 For maintaining the validity of classification, surveys after construction by CCS are to be requested in accordance with Chapter 5 of this PART.

Section 7 STATUTORY SERVICES

2.7.1 General requirements
2.7.1.1 Upon the authorization by the Government of the flag State, and at the request of the owner or ship designer or shipyard or upon contract/agreement with them, CCS will undertake a part of or all statutory services for ships.
2.7.1.2 When so authorized, CCS will issue/endorse appropriate statutory certificates and/or reports, upon completion of plan approval, surveys during and after construction, and confirmation that the classed portions of the ship are in compliance with CCS classification rules and the relevant statutory requirements.
2.7.1.3 For ships requesting to be classed with CCS, where statutory services for such ships are or the assessment of relevant statutory requirements is delegated to CCS, CCS will carry out the classification services in conjunction with the statutory services or assessment of statutory requirements.

2.7.1.4 For ships receiving both classification and statutory services by CCS, where the classification certificate is invalidated and this will affect the conditions for issuance of the relevant statutory certificates, the relevant statutory certificates or documents of compliance (e.g. for safety and load lines) will be invalidated simultaneously.

2.7.2 Basis for statutory services

2.7.2.1 The statutory requirements for convention ships are referred to international conventions or codes and the amendments thereto, mainly including:

— International Convention on Load Lines, 1966 and the Protocol of 1988 relating to the International Convention on Load Lines, 1966;
— International Convention for the Safety of Life at Sea, 1974;
— International Convention on Tonnage Measurement of Ships, 1969;
— International Convention for the Prevention of Pollution from Ships, 1973, as modified by the 1978 and 1997 Protocols;
— International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk;
— International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk;
— International Convention on the Control of Harmful Anti-fouling Systems on Ships, 2001;
— International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004;
— International Regulations for Preventing Collisions at Sea, 1972.

2.7.2.2 The statutory requirements for non-convention ships and ships navigating in national waters are referred to the relevant statutory requirements of the Government of the flag State.

2.7.2.3 The applicable statutory requirements are to be clearly specified in the application form or contract/agreement.

2.7.2.4 For authorized statutory service, the statutory requirements for convention ships are to include those contained in the Guidelines for Implementation of Statutory Surveys for Ships Engaged on International Voyages[①], unless provided with written instruction to apply a different interpretation with regard to the conventions referred to in 2.7.2.1 by the flag Administration.

2.7.3 Responsibilities of parties concerned

2.7.3.1 The right to interpret the statutory requirements rests with the Administration of the flag State.

2.7.3.2 The Administration of the flag State is responsible for the equivalence and exemption covered by the statutory requirements.

2.7.3.3 In carrying out statutory services, CCS will not be liable for any modification costs of any ship or any loss caused by traceability of the statutory requirements of the Administration of the flag State to existing ships.

2.7.4 Assessment of statutory requirements at the request of client

2.7.4.1 At the request of or upon a contract/agreement with the client, CCS may carry out the assessment of the relevant statutory requirements which are not delegated by the flag Administration, or the compliance of which is voluntarily requested by the client.

2.7.4.2 When assessment of statutory requirements is requested by the client, CCS will issue appropriate statutory certificates and/or reports, upon completion of plan approval, surveys during and after construction, and confirmation that the classed portions of the ship are in compliance with CCS classification rules and the relevant statutory requirements.

2.7.4.3 According to the statutory requirements as requested by the client, CCS will issue appropriate documents of compliance and/or reports, the acceptability of which to the flag Administration is, however, not warranted by CCS.

2.7.4.4 Paragraphs 2.7.1.3, 2.7.1.4 and 2.7.3.3 of this Section also apply to the assessment of statutory requirements.

Section 8 APPROVAL OF SUPPLIERS

2.8.1 General requirements

① Guidelines for Implementation of Statutory Surveys for Ships Engaged on International Voyages are available on CCS website: http://www.ccs.org.cn.

2.8.1.1 Suppliers providing services on behalf of the owner to CCS, such as measurements, tests or maintenance of safety systems and equipment, the results of which will be used by CCS Surveyors as the basis for surveys, are subject to approval by CCS as evidence for their capabilities to provide the approved services.
2.8.1.2 Where such services are used by CCS in making decisions affecting statutory certificates, the suppliers are subject to approval by CCS. In addition, CCS may accept the suppliers recognized by the flag Administration or an organization authorized by it.
2.8.1.3 Suppliers do not act on behalf of CCS and are responsible for the services provided by them and the results thereof.

2.8.2 Requirements for approval
2.8.2.1 Any supplier requesting approval is to meet the following conditions:
(1) sufficient competent technicians, operators, inspectors and supervisors are available for providing approved services;
(2) necessary and appropriate equipment and facilities are in place;
(3) an effective and documented quality assurance system has been established and is being maintained.
2.8.2.2 The scope and procedure of approval of suppliers are to be in compliance with Appendix 8 — Procedural Requirements for Approval of Service Suppliers and Appendix 23 — Requirements for NDT Suppliers to Chapter 5 of this PART.

2.8.3 List of approved suppliers
2.8.3.1 CCS publishes and maintains a list of suppliers approved by CCS①.

Section 9 ASSIGNMENT, MAINTENANCE, SUSPENSION, CANCELLATION AND REINSTATEMENT OF CLASS

2.9.1 Assignment and maintenance of class
2.9.1.1 Where the hull (including equipment) and machinery (including electrical installations) are found in compliance with the relevant provisions of CCS rules after plan approval and surveys, the characters of classification and corresponding class notations will be assigned, and the classification certificate will be issued by CCS.
2.9.1.2 Owners are to ensure proper maintenance of the ship and to operate according to the conditions specified in the classification certificate.
2.9.1.3 The CCS class assigned to a ship which is found to comply with the Rules upon surveys after construction will continue to be valid, and CCS will endorse or renew the classification certificate.
2.9.1.4 CCS reserves the right to perform unscheduled surveys of the ship when CCS has reasonable cause to believe that the ship has the possibilities of affecting class maintenance between two periodical surveys. The notice for arranging an unscheduled survey will be sent in writing by CCS to the owner who is to promptly arrange the survey and has the obligation to pay the related expenses.

2.9.2 Suspension and cancel of class
2.9.2.1 Suspension of class
(1) When a ship is operating beyond the service limitation defined by its characters of classification and class notations or any other additional condition as approved, its class will be suspended and its classification certificate invalidated.
(2) Any damage, defect, failure or grounding that may affect the validity of the assigned class may, if not reported to CCS without inappropriate delay or prior agreement of CCS to foreseen repairs not obtained, lead to suspension of the class and invalidation of the classification certificate.
(3) Under the following circumstances, the class will be subject to a suspension procedure, unless the ship is attended by the Surveyor for completion of the overdue surveys:
① when any condition of class imposed by CCS is not fulfilled by a specified due date (the Owner will be notified of the date), and no extension is granted by CCS;
② when any continuous survey item due or overdue at time of annual survey has not been dealt with, and no extension is granted by CCS at the time of an annual survey;
③ when surveys after construction other than annual, intermediate or special surveys are overdue, and

① The list of suppliers approved by CCS is available on CCS website: http://www.ccs.org.cn.

no extension is granted by CCS;

④ when repairs of any damage, defect, failure or grounding have not been completed and surveyed as specified;

⑤ failure to permit the unscheduled surveys referred to in 2.9.1.4 above;

⑥ when the laying-up maintenance programme agreed by CCS has not been implemented or the laying-up survey has not been performed within the specified time limit during the laying-up period of the ship.

(4) Under the following circumstances, the class will be subject to automatic suspension and the classification certificate is subject to invalidation:

① when an annual survey has not been completed within 3 months of the due date of the annual survey, unless the ship is under attendance for completion of the annual survey;

② when an intermediate survey has not been completed within 3 months of the due date of the third annual survey in each special survey period (5 years), unless the ship is under attendance for completion of the intermediate survey;

③ when a special survey has not been completed within the period of time specified by CCS (the Owner will be notified that the 5-year class certificate becomes invalid) and no extension is granted by CCS, unless the ship has been under attendance for completion of the special survey prior to resuming trading, by the due date.

a. Under "exceptional circumstances", CCS may grant an extension not exceeding 3 months to allow for completion of the special survey, provided that the ship is attended and the attending Surveyor so recommends upon satisfactory survey to the following extent:
   (a) annual survey;
   (b) re-check of conditions of class;
   (c) progression of the special survey as far as practicable;
   (d) where the docking survey is due prior to the expiry date of the extension, an underwater examination is to be carried out by an approved diving company. Such underwater examination may be dispensed with in the case of extension of docking survey not exceeding 36 months provided the ship is without any condition of class regarding underwater parts.

b. In the case that the class certificate will expire when the ship is expected to be at sea, an extension to allow for completion of the special survey may be granted provided there is documented agreement to such an extension prior to the expiry date of the certificate, and provided that positive arrangements have been made for attendance of the Surveyor at the first port of call, and provided that CCS is satisfied that there is technical justification for such an extension. However, if owing to "exceptional circumstances" the special survey cannot be completed at the first port of call, the subparagraph a. above may be followed, but the total period of extension shall in no case be longer than 3 months after the original due date of the special survey;

④ when it is confirmed that the Surveyor has boarded the ship before the survey is due, but the ship is put into service before the satisfactory completion of the corresponding overdue survey.

(5) If, due to circumstances reasonably beyond the owner's or CCS control, the ship is not in a port where the overdue surveys can be completed at the expiry of the periods allowed above, CCS may allow the ship to sail, in class, directly to a discharge port, and if necessary, hence, in ballast, to a port at which the survey will be completed, at request of the owner and provided that:

① relevant records are examined;

② the due and/or overdue surveys and examination of conditions of class are carried out by CCS at the next port of call when there is an unforeseen inability of CCS to attend the ship at the present port;

③ upon review of the ship's history and survey at the present port, the attending Surveyor is satisfied that the ship is in condition to sail for one trip to a discharge port and if necessary, hence, in ballast to a repair facility, and this is to be confirmed by the Headquarters of CCS. Where there is an unforeseen inability of CCS to attend the ship at the present port, the master is to confirm that his ship is in condition to sail to the nearest port of call.

The above-mentioned overdue surveys to be carried out are to be based upon the survey requirements at the original date due and not on the age of the vessel when the survey is carried out. Such surveys are to be credited from the date originally due. If class has already been automatically suspended in such cases, it may be reinstated subject to the conditions prescribed above.

(6) Where a ship has been detained following a Port State Control inspection on two occasions in one year or three occasions in two years, with serious deficiencies found, then the class will be liable to be

suspended, at the discretion of CCS, and a corresponding note will be given in the Register of Ships.
(7) When a ship is dual classed and in the event that one of the Societies involved takes action to suspend the class of the ship for technical reasons, the Society concerned is to advise the other Society of the reasons for such action and the full circumstances within five (5) working days. The other Society is, upon receipt of this advice, also to suspend the class of the ship, unless it can otherwise document that such suspension is incorrect.
(8) The class of ships which are laid up in accordance with CCS Rules prior to surveys becoming overdue need not be suspended when surveys addressed above become overdue. However, the class of ships which are laid up after being suspended as a result of surveys going overdue, remain suspended until the overdue surveys are completed.
(9) When a ship is intended for a demolition voyage with any periodical survey overdue, the ship's class suspension may be held in abeyance and consideration may be given to allow the ship to proceed on a single direct ballast voyage from the lay-up or final discharge port to the demolition yard. In such cases a short-term class certificate with conditions for the voyage noted may be issued provided the attending Surveyor finds the ship in satisfactory condition to proceed for the intended voyage.
(10) When a ship is intended for a single voyage from laid-up position to a repair yard or another lay-up site with any periodical survey overdue, the ship's class suspension may be held in abeyance and consideration may be given to allow the ship to proceed on a single direct ballast voyage from the site of lay up to a repair yard or another lay-up site, upon agreement with the flag Administration, provided CCS finds the ship in satisfactory condition after surveys, the extent of which are to be based on surveys overdue and duration of lay-up. A short term Class Certificate with conditions for the intended voyage may be issued. This does not apply to ships whose class was already suspended prior to being laid-up.
2.9.2.2 Cancel of class
(1) The class of a ship will be cancelled in any one of the following cases:
① at the request of the owner;
② the circumstances leading to suspension of class are not corrected within the time specified;
③ a ship's class will be canceled immediately when the ship proceeds to sea without having completed conditions of class which were required to be dealt with before leaving port;
④ when class has been suspended for a period of six (6) months due to overdue annual, intermediate, special surveys or other surveys after construction as required by the Rules and/or overdue conditions of class.
A longer suspension period may be granted for ships which are either laid up, awaiting disposition of a casualty or under attendance for reinstatement;
⑤ where hull, equipment or machinery (including electrical installations) is so badly damaged or in other conditions (e.g. sinking, scrapping, etc.) that continuing operation of the ship is confirmed as not possible;
⑥ when the payment of survey fees is not made in time.
(2) Where a ship has been detained following a Port State Control inspection on two occasions in one year or three occasions in two years, with serious deficiencies found, then the class will also be liable to be canceled, at the discretion of CCS, and a corresponding note will be given in the Register of Ships.
2.9.2.3 If survey requirements related to maintenance of class notations are not carried out in any case of suspending or canceling class stated above, the suspension or cancellation is to be limited to those class notations only.
2.9.2.4 Notification of suspension or cancellation of class
(1) Cancellation of class of a ship will be indicated correspondingly in CCS Register of Ships or its supplements.
(2) When the class of a ship is suspended or cancelled, CCS will send written notification to the owner and the Administration of the flag State, and make an announcement on CCS website available to the underwriters and other interested parties concerned.
(3) For ships to which SOLAS applies, the notification will state that certain statutory certificates are implicitly invalidated by the suspension or withdrawal of class.

2.9.3 Reinstatement of class
2.9.3.1 The class of a ship may be reinstated in any one of the following cases:
(1) class will be reinstated upon satisfactory completion of the overdue surveys. The overdue surveys to be carried out are to be based upon the survey requirements at the original date due and not on the age of the ship when the survey is carried out. Such surveys are to be credited as of the original due date. However, the ship is disclassed from the date of suspension until the date class is reinstated;

(2) class will be reinstated upon verification that the due or overdue continuous survey items have been satisfactorily dealt with;
(3) class will be reinstated upon verification that due or overdue condition of class has been satisfactorily dealt with. However, the ship is disclassed from the date of suspension until the date class is reinstated.
2.9.3.2 When the class of a ship is reinstated, CCS will send written notification to the owner and the Administration of the flag State, and make an announcement on CCS website available to the underwriters and other interested parties concerned.
2.9.3.3 When either Society decides to reinstate class, it is to inform the other Society.

Section 10 CERTIFICATES AND REPORTS

2.10.1 Certificates
2.10.1.1 A classification certificate indicates only that the items covered by it, as verified during plan approval and classification surveys, are in compliance with CCS rules and fit for their intended purposes.
2.10.1.2 Classification certificates and related reports are issued by CCS independently.
2.10.1.3 The classification certificate is to contain the terms and conditions as agreed between both parties.

2.10.2 Duration and validity of certificates
2.10.2.1 The period of validity of classification certificates of ships is in general not to exceed 5 years.
2.10.2.2 The period of validity of classification certificates is to be harmonized with that of statutory certificates of the ship as possible.
2.10.2.3 When the special survey is completed within three months before the expiry date of the existing certificate, the new classification certificate is to be valid to a date not exceeding five years from the date of expiry of the existing certificate.

2.10.3 Issue and endorsement of classification certificates
2.10.3.1 Upon completion of classification surveys, the survey unit is to issue the classification certificate together with records, reports and other technical documents to the related department of CCS Headquarters for review and then submitted by the department to the Class Committee and upon approval by the Committee, the classification of a ship will be finally confirmed by the President of CCS or person(s) authorized by him.
2.10.3.2 The classification certificate is to be endorsed by the Surveyor as required after completion of the survey after construction as specified in Chapter 5 of this PART.
2.10.3.3 Where a new classification certificate cannot be issued to the ship before the expiry date of the existing classification certificate after completion of the special survey, the existing classification certificate may be endorsed by the Surveyor, which is to be valid within 5 months from its expiry date.
2.10.3.4 Upon completion of the special survey, the survey unit is to submit a report and other technical documents to the related department of CCS Headquarters or another designated survey unit for review, and upon satisfactory review a new classification certificate will be issued by the President of CCS or a person authorized by him.
2.10.3.5 Notwithstanding the provision of 2.10.2.1, CCS may, when applying 2.10.3.4, determine a period of validity less than 5 years for the classification certificate and/or take any other necessary restrictive measure (e.g. service restriction(s) being noted on the newly issued classification certificate), based on a comprehensive consideration of the available information on other aspects of safe operation of the ship (safety inspections by the flag/port State, safety management of the shipping company, etc.). Where the period of validity is shortened, it is to be harmonized with the intervals between classification/statutory surveys so far as practicable and regular reports are to be sent to the Class Committee.

Section 11 REGISTER OF SHIPS AND LISTS OF APPROVED MARINE PRODUCTS①

① CCS Register of Ships and Lists of Approved Marine Products are available on CCS website: http://www.ccs.org.cn.

2.11.1 Register of Ships

2.11.1.1 CCS will enter main characteristic particulars and details of all ships classed with CCS, after they are assigned characters of classification and class notations, into the Register of Ships of CCS to provide information for those related to ships, such as shipbuilders, owners, underwriters, shippers and charterers.

2.11.1.2 Subsequently, in case changes concerning ships or their characteristic particulars are made, CCS will renew the Register of Ships in time.

2.11.2 Lists of Approved Marine Products

2.11.2.1 CCS will enter the names, main characteristic particulars and details of related products as well as detailed information on their manufacturers in respect to those factories and plants and their marine products approved by CCS into the Lists of Approved Marine Products of CCS to provide information for ship-designing institutes, shipbuilders, owners, traders and exporters.

2.11.2.2 Subsequently, in case changes concerning performance of the approved products are made or their scope is extended, CCS will renew the Lists of Approved Marine Products in time.

Section 12 AVAILABILITY AND CONFIDENTIALITY OF INFORMATION

2.12.1 Availability of information

2.12.1.1 The party who makes any information available to CCS as required for classification of the ship shall be responsible for the truthfulness, timeliness and completeness of such information.

2.12.2 Disclosure of information

2.12.2.1 CCS will not disclose any information obtained for classification of the ship to any other party not specified in the contract and Tables 2.12.2.2(1) and 2.12.2.2(2), except in the following cases:

(1) when the class of the ship is transferred from CCS to another member society of IACS, the relevant class information together with survey reports for the ship are to be made available to that society;

(2) as required by IACS, the updated data related to the Register of Ships, the data of class suspension and survey status, and the information on failure incidents of ships are to be communicated to IACS;

(3) the owners, ship operators are to authorize CCS to accepting the representative(s) of third-party independent audit organizations, e.g. representative(s) of an Accredited Certification Body (ACB), IACS observer(s), etc., and the representative(s) of the European Commission (EC) may, during their audit or assessment of CCS, have access to the certificates, documents and other information related to the ships classed with CCS;

(4) the flag State has special legal provisions for the disclosure, or the court having jurisdiction or the owner agrees in writing to the disclosure.

2.12.2.2 The concerned parties who are entitled to have access to such information are given in Tables 2.12.2.2(1) and 2.12.2.2(2).

Information Available to Parties Concerned① **Table 2.12.2.2(1)**

Information in question	Information available to:

2.12.2.3 Notwithstanding the general duty of confidentiality owed by CCS to its client in accordance with its Rules, CCS' clients hereby accept that CCS will implement IACS' Procedure for Early Warning① which requires each IACS Member to provide its fellow IACS Members with relevant technical information on serious failures of hull structures and engineering systems, as defined in the IACS' Procedure for Early Warning (but not including any drawings relating to the ship which may be the specific property of another party), to enable such useful information to be shared and utilized. CCS will provide its client with written details of such information upon sending the same to IACS Members.

Section 13 LIABILITY, DISAGREEMENT AND ARBITRATION

2.13.1 Liability of each party

2.13.1.1 CCS rules are the basis for the design, building, manufacturing and testing of ships and related products, but not the sole basis for the design. The rules can neither replace the control of technological process and quality by builders or manufacturers, nor diminish their liability in this respect or absolve them therefrom.

2.13.1.2 CCS rules do not cover every piece of structure or item of equipment on board a ship, nor do they cover operational elements, or activities which fall outside the scope of classification and include such items as design and manufacturing processes, choice of type and power of machinery and certain equipment, number and qualification of crew or operating personnel, form and cargo-carrying capacity of the ship and manoeuvring performance, cargo securing, hull and equipment vibrations, noises, spare parts, life-saving appliances and maintenance equipment.

2.13.1.3 CCS will not be liable for any loss of any result of applying CCS rules by any third party without plan approval or ship surveys by CCS.

2.13.1.4 The classification of ships undertaken by CCS is carried out on the basis that the designers, builders, owners, manufacturers, sellers, suppliers, repairers, operators and other parties fulfill their respective responsibilities. The contents of any reports, documents and certificates issued by CCS do not mean to diminish any liability of any party mentioned above or absolve it therefrom.

2.13.1.5 Any survey-related document issued by CCS only reflect the status at the time when the survey is carried out.

2.13.1.6 The classification certificate (with characters of classification and class notations thereon) is only an attestation that the ship is in compliance with the applicable CCS classification rules and/or other standards agreed in writing by CCS and the applicant for CCS service. If the ship is not in compliance with such rules or standards, CCS has the power to withhold, suspend or withdraw the characters of

① For details, refer to IACS PR2A "Procedure for Hull Failure Incident Reporting" and PR2B "Procedure for Early Warning of Serious Hull Failure Incidents - "Early Warning Scheme – EWS".

classification and class notations.
2.13.1.7 Except as required by CCS rules, CCS will make no representations beyond the relevant reports, statements, plan approval, surveys, certification or other services. The application of the information supplied by CCS in documents other than classification certificates and reports is at the discretion of the users, and CCS is not liable for the results of such actions.
2.13.1.8 CCS is to provide service(s) based on the contract only, in no case shall CCS be liable for any loss of any party who has no direct contractual relations with CCS.
2.13.1.9 The owner and/or the shipyard is to promptly feed back to the manufacturer and CCS any problem revealed in operation of marine products so as to facilitate improvement by the manufacturer.
2.13.1.10 CCS' omission or failure to carry out or observe any stipulation, condition, or obligation to be performed under the contract will not give rise to any claim against CCS or be deemed to be a breach of contract if the omission or failure arises from causes beyond CCS' reasonable control.
2.13.1.11 CCS does not promise the safety of life and property at sea and the seaworthiness of ships, because CCS is not the principal part operating and maintaining the ship between surveys.
2.13.1.12 Shipowners have the obligation to maintain the validity of class and statutory certificates.

2.13.2 Disagreement

2.13.2.1 The right of interpretations on the rules published by CCS is to be left solely to CCS Headquarters. CCS rules are translated by CCS into English. In case of any different understanding to the English version, the currently effective Chinese version of the rules is to be considered as solely authoritative.
2.13.2.2 Where there is disagreement between the Surveyor and the interested party during survey, which affects the project schedule, the latter is to promptly appeal in writing to the unit where the Surveyor serves. Where the handling of the appeal by the unit is not considered satisfactory by the interested party, it may appeal in writing to CCS Headquarters along with detailed background materials. The Headquarters will decide on the matter, and this ruling will be final.
2.13.2.3 The costs arising from any examinations carried out by the Headquarters on request are to be paid by the appellant, except for those cases in which the appeal proves justified.

2.13.3 Arbitration

2.13.3.1 CCS will be liable only for the loss or damage resulting directly from its negligent act. In no event shall CCS be liable for any indirect or consequential losses or damages.
2.13.3.2 Notwithstanding the previous paragraph, CCS will be liable for the loss or damage due to negligent act judicially attributed exclusively to CCS or its employees, agents or other parties acting on behalf of CCS. And in no case shall the amount of this liability exceed five times the fee(s) charged by CCS in respect of the service(s) in question or 2,000,000 RMB in maximum. CCS liability for the loss or damage is specially excluded when such loss or damage arises out of an act:
(1) by an employee of CCS acting outside the terms or scope of his/her employment; or
(2) by any agent or other party acting on behalf of CCS, when such act exceeds the authority granted in writing by CCS to such agent or party.
2.13.3.3 Any claim for any loss or damage set forth above is to be made in writing within six months of the date the damage first discovered or the loss occurred; failure of doing so will be deemed as an absolute waiver of this right.
2.13.3.4 Unless otherwise agreed with CCS, any dispute of whatsoever nature in respect to the Rules or the service(s) provided in accordance with the Rules shall be referred to China Maritime Arbitration Commission and arbitrated in accordance with its arbitration rules effective at the time of request for arbitration. The arbitration award shall be final and binding upon both interested parties.

2.13.4 Applicable laws

2.13.4.1 The laws of the People's Republic of China shall apply.

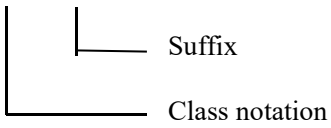
Appendix 1 LIST OF CLASS NOTATIONS FOR SEA-GOING SHIPS

Ships or machineries (including electrical installations) constructed or manufactured in accordance with relevant rules issued by CCS or other equivalent regulations accepted by it will be assigned appropriate class notations by CCS. CCS class notations in use for sea-going ships are listed in this Appendix for reference and application.

General principles for identification of class notations are as follows:

1. Class notations are marked after characters of classification, where the notations for type of ship, hull and service restriction or limitation, features, equipment, cargo and loading characteristics, survey, etc., are marked after the characters ★CSA and the notations for automation and special equipment of machinery, machinery survey, green ecology, etc., are marked after the characters ★CSM.
2. The class notations for type of ship and/or special duties and service or service restriction are necessary notations and are to be assigned together with characters of classification.
3. Where a class notation (other than those referred to in 2 above) assigned to a specific ship together with characters of classification is required by the rules to which the ship is subject, such notation is a necessary one for this ship, or an optional one.
4. Where multiple class notations for type of ship are assigned, such individual notations are to be separated by the sign "/", i.e. Tug/ Offshore Supply ship.
5. Any suffix to a class notation is to be bracketed and every two suffixes are to be separated by a comma ",", i.e.:

Loading Computer (S, I);



6. Every two sets of class notations are to be separated by a semicolon ";".
7. Unless specifically stated otherwise, class notations are generally given in the sequence A ~ K as shown in the table below:

Types of class notations	Type of ship	Special duties	Service or service restriction	Cargo and loading characteristics	Special features	Automation	Special equipment and system	Special survey	Green ecology	Refrigerated cargo installation	Other notations
Table	Table A	Table B	Table C	Table D	Table E	Table F	Table G	Table H	Table I	Table J	Table K

For example, in respect to a bulk carrier constructed under supervision of CCS according to CSR rules, engaged in non-restricted service and service in floating ice condition, with design check by COMPASS-Structure software, with loading computer for calculation of overall strength, intact stability and bulk grains, machinery space periodically unattended, screwshaft condition monitoring and subject to in-water survey, the following characters of classification and class notations are to be assigned:

★CSA Bulk Carrier; CSR; BC-A (Holds Nos. 2, 4 and 6 may be empty); COMPASS (R, D, F); GRAB［20］; Ice Class B; Loading Computer (S, I, G); ESP; In-Water Survey

★CSM AUT-0; SCM

Type Notations① **Table A**

Class notation	Description		Technical requirements②
General Dry Cargo Ship	General dry cargo ships	Ships intended primarily to carry dry cargo, and also liquid cargo contained in vessels, other than bulk carriers, container ships, ro-ro cargo ships, refrigerated cargo ships, cement carriers, livestock carriers, wood chip carriers, deck cargo ships and general dry cargo ships of double side skin construction. For general dry cargo ships of double side-skin construction, with double side-skin extending for the entire length of the cargo area, and for the entire height of the cargo hold to the upper deck, the notation "Double Side Skin" is to be added after their type notation and separated by a comma ",", i.e. General Dry Cargo Ship, Double Side Skin.	Ch. 2, Pt. 2 of the Rules
Cement Carrier	Cement carriers	Ships designed and constructed specifically for the carriage of cement	Ch. 2, Pt. 2 of the Rules
Deck Cargo Ship	Deck cargo ships	Ships designed for the carriage of cargo exclusively above deck with no cargo hold fitted	Ch. 2, Pt. 2 of the Rules
Refrigerated Cargo Ship	Refrigerated cargo ships	Ships fitted with refrigerated cargo installations, dedicated to the carriage of perishable goods such as fish, meat, fruits, vegetables, etc.	Ch. 2, Pt. 2, Ch. 1 to Ch. 3, Pt. 5 of the Rules
Livestock Carrier	Livestock carriers	Ships designed and constructed specifically for the carriage of livestock such as cattle, sheep, etc.	Ch. 2, Pt. 8 of the Rules
Passenger Ship	Passenger ships	Ships carrying more than 12 passengers	Ch. 9, Pt. 2 of the Rules
RO-RO Ship	Ro-ro ships	Ships carrying vehicles or cargo in pallet form or in containers and loaded/unloaded by wheeled vehicles	Ch. 9, Pt. 2 of the Rules
RO-RO Passenger Ship	Ro-ro passenger ships	Passenger ships with ro-ro cargo spaces or special category spaces and capable of carrying road vehicles	Ch. 9, Pt. 2 of the Rules
Train/RO-RO Passenger Ship	Train and ro-ro passenger ships	Ro-ro ships carrying more than 12 passengers and capable of carrying trains	Ch. 9, Pt. 2 of the Rules
Ferry	Ferries	Ships having a continuous deck and carrying passengers (without sleeping berths) and/or vehicles for regular voyages between two sides of straits or islands	1. For ships not less than 20 m in length, in accordance with Ch. 9, Pt. 2 of the Rules; 2. For ships less than 20 m in length, in accordance with Rules for Classification of Sea-going Boats. Where more than 12 passengers are carried, technical requirements for passenger ships need to be satisfied, unless special provisions are specified by the Administration. In this case, only the Passenger Ship/Boat notation is assigned
Ferry Passenger Ship	Ferry passenger ships	Ferry carrying more than 12 passengers	Ch. 9, Pt. 2 of the Rules
Bulk Carrier	Bulk carriers	Ships carrying mainly dry cargo in bulk, normally constructed with single deck, topside tanks,	Ch. 8, Pt. 2 of the Rules

① For high speed craft complying with the provisions of the Rules for Classification of Sea-going Boats, the suffix (HSC) will be added after the type notation.

② The technical requirements listed in this Table are the basic ones for ships assigned to the notation; in other special cases involving ship types, special consideration is to be given by CCS according to the ship's specific conditions.

Class notation	Description		Technical requirements②
		hopper tanks and double bottom in cargo spaces, cargo holds bounded by side shell. For bulk carriers, of which all cargo holds are bounded by double side skin construction of not less than 1000 mm breadth at any location within the hold length, the notation “Double Side Skin” is to be added after their type notation and separated by a comma “,”, i.e. Bulk Carrier, Double Side Skin. For sea-going self-propelled ships intended to carry and self-unload dry cargoes in bulk, the class notation “Self-Unloading Bulk Carriers” is to be assigned	
Ore Carrier	Ore carriers	Ships constructed with single deck, 2 longitudinal bulkheads and a double bottom throughout the centre hold and intended primarily to carry ore cargoes in the centre holds only	Ch. 16, Pt. 2 of the Rules; for ore carriers of 250 m and over in length and engaged in unrestricted service, in accordance with Rules for Structures of Ore Carriers
Water Tanker	Water tankers	Tankers carrying fresh water	Ch. 2 and applicable sections of Ch. 5 & 6, Pt. 2 of the Rules
Oil Tanker	Oil tankers	Ships carrying crude oil or oil products, note to be added according to flash point of oil carried: ① flash point above 60℃: F.P. > 60℃ ② flash point up to 60℃: F.P. ≤ 60℃	Ch. 6, Pt. 2 of the Rules
		For ships with distance between two hulls in compliance with the Rules, single deck and small-size hatches, carrying crude oil or oil products, the notation “Double Hull” may be added and separated by a comma “,”, i.e. Oil Tanker, Double Hull	Ch. 5, Pt. 2 of the Rules
Ore/Oil Carrier	Ore/oil carriers	Ships with single hull, single deck, 2 longitudinal bulkheads and double bottom, all or most of center holds used for carrying ore, side or side and some centre holds used for carrying oil	Ch. 5, Ch. 6 & Ch. 16, Pt. 2 of the Rules
Ore/Bulk/Oil Carrier	Ore/bulk/oil carriers	Ships with double hull, single deck, double bottom, topside tanks and hopper tanks, carrying oil or dry bulk cargo (including ore)	Ch. 5, Ch. 6 , Ch. 8 & Ch.16, Pt. 2 of the Rules
Container Ship	Container ships	Ships having double bottom and double side skin construction with torsion box girders fitted at top sides, large deck openings, carrying containers, or as alternative, single side skin construction with double bottom and torsion box girders or equivalent structure	Ch. 7, Pt. 2 of the Rules
Car Carrier	Car carriers	Ships specially designed and constructed for carriage of commercial wheeled vehicles	Guidelines for Hull Structure of Car Carriers
Open-Top Container Ship	Open-top container ships	Ships having double bottom and double side skin construction with torsion box girders fitted at top sides, large deck openings, carrying containers, or as alternative, single side skin construction with double bottom and torsion box girders or equivalent structure, but no hatch covers for holds	Ch. 6, Pt. 8 of the Rules
Timber Carrier	Timber carriers	Dedicated log or timber carriers, provided with securing equipment, for which the notation Log Carrier may also be used	Ch. 2, Pt. 2 of the Rules, Guidelines for the Preparation of the Cargo Securing Manual
Barge	Barges	Ships not provided with main propulsion machinery used for navigation purposes. Where such ships are dedicated to carriage of a specific cargo, they may be identified, as necessary, by the notation X Barge where X is the name of the specific cargo	Ch. 12, Pt. 2 of the Rules

Class notation	Description		Technical requirements②
Oil Barge	Oil barges	Barges carrying crude oil or oil products within holds	Ch. 12, Pt. 2 of the Rules
Floating Concrete Mixer	Floating concrete mixers	Barges mixing concrete on the water and depositing concrete directly at the construction site	Ch. 12, Pt. 2 of the Rules
Chemical Barge	Chemical barges	Barges carrying chemicals within holds	Ch. 12, Pt. 2 of the Rules
Gas Barge	Gas barges	Barges carrying liquefied gases within holds	Ch. 12, Pt. 2 of the Rules
Pontoon Barge	Pontoon barges	Square barges carrying water-resistant cargoes on deck	Ch. 12, Pt. 2 of the Rules
Launch Barge	Launch barges	Barges dedicated to carriage of offshore jacket structures and for launching such jackets, which will be slid into water through trim of the barge by stern	Ch. 12, Pt. 2 of the Rules
Shipborne Barge	Shipborne Barge	Barges carried onboard ship and generally carrying general dry cargoes in the cargo holds	Ch. 12, Pt. 2 of the Rules
Barge Carrier	Barge carriers	Dedicated cargo barge and heavy cargo carriers with large deck area	Ch. 2, Pt. 2 of the Rules
Bridge Crane and Heavy Equipment Carrier	Bridge equipment carriers	Carriers having large deck areas and exclusively engaged in loading/unloading on decks and long-distance transportation by sea of complete sets of heavy equipment and project facilities with large dimension/heavy weight such as bridge cranes and heavy equipment	Ch. 18, Pt. 8 of the Rules
Live Fish Carrier	Live fish carriers	Ships fitted with live fish holds, provided with water cycling or exchanging, in some cases provided with devices for increasing oxygen, purifying water and/or reducing temperature, dedicated to carry live fish	Ch. 2, Pt. 2 of the Rules
Semi-Submersible Vessel	Semi-submersible vessels	Ships capable of being semi-submersible when needed during loading and unloading or operation	Ch. 15, Pt. 2 of the Rules
Tug	Tugs	Ships fitted with towing equipment, dedicated to towing ships or other floating objects on water	Ch. 10, Pt. 2 of the Rules
Chemical Tanker	Chemical tankers	Ships similar as oil tankers, provided with cargo containment system, dedicated to carry liquid cargoes as listed in IBC Code. Chemical tankers constructed on or after 1 July 1986 and complying with IBC Code are to be assigned the following notations respectively, depending on the category of chemicals carried: ① Type 1: Carrying chemicals with very severe environmental and safety hazards, fitted with integral and independent tanks; ② Type 2: Carrying chemicals with appreciably severe environmental and safety hazards, fitted with integral and independent tanks; ③ Type 3: Carrying chemicals with sufficiently severe environmental and safety hazards, fitted with integral and independent tanks. Chemical tankers constructed before 1 July 1986 and complying with BCH Code are to be assigned the notations of Type I/Type II/Type III respectively instead of Type 1/Type 2/Type 3	Rules for Construction and Equipment of Ships Carrying Dangerous Liquid Chemicals in Bulk
Liquefied Gas Carrier	Liquefied gas carriers	Ships provided with cargo containment system, dedicated to carry liquefied gases or other cargos as listed in the Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk. Liquefied gas carriers constructed on or after 1 July 1986 and complying with IGC Code are to be assigned the following notations respectively, depending on the preventive measures to preclude the escape of cargo: ① Type 1G: Maximum preventive measures are required to preclude the escape of cargo; ② Type 2G: Significant preventive measures are	Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk

Class notation	Description		Technical requirements②
		required to preclude the escape of cargo; Type 2PG: For gas carriers of 150 m in length or less and significant preventive measures are required to preclude the escape of cargo, the products are carried in type C independent tanks designed for a MARVS of at least 0.7 MPa gauge with a MARVS of 7 bar gauge and a cargo containment system design temperature of -55℃ or above; ③ Type 3G: Moderate preventive measures are required to preclude the escape of cargo. Liquefied gas carriers constructed before 1 July 1986 and complying with GC Code are to be assigned the notations of Type IG/Type IIG/Type IIPG/ Type IIIG respectively instead of Type 1G/Type 2G/Type 2PG/ Type 3G. The following notations are to be assigned respectively, depending on the type of cargo containment systems: Type A Independent Tank Type B Independent Tank Type C Independent Tank Integral Tank Membrane Tank Semi-Membrane Tank Ships primarily intended to carry one or more products as listed in Chapter 19, PART THREE of the Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk may be assigned "for + product name(s)" after "Carrier". The product name(s) is/are to be in accordance with column a, Summary of minimum requirements, Chapter 19, PART THREE of the Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk, e.g.: Liquefied Gas Carrier for Ethane Liquefied Gas Carrier for Butane, Butane and Propane mixture	
LNG Carrier	LNG carriers	Liquefied gas carriers dedicated to carrying liquefied natural gas. The notations Type 1G/Type 2G/Type 2PG/ Type 3G or Type IG/Type IIG/Type IIPG/ Type IIIG are to be added for preventive measures to preclude the escape of cargo, as stated in column Description for the notation Liquefied Gas Carrier	Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk; Ch.20, Pt.2 of the Rules
		Where LNG carriers are adapted for FSUs, the notation "LNG-FSU" (Liquefied Nature Gas-Floating Storage Unit) is to be added after LNG Carrier and separated by a comma ",", i.e. LNG Carrier, LNG-FSU	Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk; Implementation Guidelines for Liquefied Nature Gas Carriers Adapted for Floating Storage Units
		Where LNG carriers are fitted with LNG regasification systems, the notation "REGAS" is to be added after LNG Carrier and separated by a comma ",", i.e. LNG Carrier, REGAS	Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk; Chapters 1 and 4 of the Rules for Construction and Equipment of Liquefied Natural Gas Floating Storage and Regasification Units; Section 4, Chapter 7 of

Class notation	Description		Technical requirements②
			the Rules for Offshore Oil and Gas Processing Systems
CNG Carrier	CNG carriers	Liquefied gas carriers dedicated to carrying compressed natural gas. The notations Type 1G/Type 2G/Type 2PG/ Type 3G or Type IG/Type IIG/Type IIPG/ Type IIIG are to be added for preventive measures to preclude the escape of cargo, as stated in column Description for the notation Liquefied Gas Carrier	Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk
Woodchip Carrier	Woodchip carriers	Ships designed and constructed for the carriage of woodchips	Guidelines for Hull Structure of Woodchip Carriers
Asphalt Carrier	Petroleum asphalt carriers	For ships dedicated to carrying melted petroleum asphalt, this type notation is to be assigned and the following notations are to be added: ① for independent tanks: independent tank, or ② for integral tanks: Integral tank; ③ for maximum cargo temperature: Max. Cargo Temperature ×××℃; In accordance with the flashpoint of petroleum asphalt, the following notations may be added respectively: ① for flash point above 60℃: F.P. > 60℃; ② where the maximum cargo temperature cannot be lower than the petroleum asphalt flash point by at least 15℃: F.P. ≤ 60℃. The notation of thermal stress calculation may be assigned if the requirements of Section 24, Chapter 2, PART TWO of the Rules are complied with. For ships with distance between two hulls in compliance with the Rules, the notation “Double Hull” may be added and separated by a comma “,”, i.e. Asphalt Carrier, Double Hull	Ch. 10, Pt. 8 of the Rules
Offshore Supply Ship	Offshore supply ships	Ships dedicated to supplying food, stores, etc., to installations and ships engaged in offshore operations	Ch. 11, Pt. 2 of the Rules
Offshore Tug/Supply Ship	Offshore tug and supply ships	Ships capable of operating as offshore supply ships and of towing operations	Ch. 11, Pt. 2 of the Rules
Geotextiles Layer	Geotextiles layers	Ships provided with special equipment for laying geotextiles, which are engaged in operations of laying soft mattress related to construction of cofferdams on land and floating structure projects under different environmental conditions such as coastal shoals and deep-water harbors	Ch. 17, Pt. 8 of the Rules
Stand-by Ship	Stand-by ships	Ships providing rescue operations and supporting services for mobile offshore drilling units or offshore oil/gas production facilities. Additional auxiliary functions such as fire fighting, towing, oil recovery, supply may be provided according to design purposes and multiple type notations may be assigned accordingly. For towing capacity fully complying with Chapter 10, PART TWO of the Rules, the notation Stand-by Ship/Tug may be assigned; and for towing capacity complying only with the requirements for towing arrangements in Chapter 10, PART TWO of the Rules, the suffix T may be added	Ch. 24, Pt. 8 of the Rules
Floating Dock with F_L (××× t)	Floating docks with F_L (××× t)	A building used for shipbuilding and ship repairs, capable of being semi-submersible in or floating on water, with its special hull being open on both	Rules for Classification of Floating Docks

Class notation	Description		Technical requirements②
		ends and corrugated in transverse section. The hull structure of the dock consists of wing walls and the dock's bottom. Wing walls and the dock's bottom are pontoons consisting of longitudinal or transverse members and face plates, divided transversely and longitudinally into watertight compartments. With water being filled into or discharged from the compartments, the amount of ballast water in the dock is increased or decreased so that the dock submerges into or rises out of water	
Cable Layer	Cable layers	Ships provided with special systems/equipment for cable laying	Ch. 28, Pt. 8 of the Rules
Pipe Layer	Pipe layers	Ships provided with special systems/operation lines for laying pipes	Ch. 29, Pt. 8 of the Rules
Chemical/Oil Tanker	Chemical/oil tankers	Tankers capable of carrying both chemicals and oil products	Rules for Construction and Equipment of Ships Carrying Dangerous Liquid Chemicals in Bulk
Fishing Vessel	Fishing vessels	Vessels provided with fishing machinery, engaged in fishery production activities and used for commercially catching fish or other living resources of the sea	Rules for Construction of Ocean-going Steel Fishing Vessels; Ch. 5, Pt. 8 of the Rules
Floating Crane	Floating cranes	Ships fitted with lifting appliances on deck, dedicated to hoisting operations on water. The notation Lifting Appliance is to be added. For floating cranes operating in restricted service, one of the following service notations is to be assigned: (1) Lifting Within R1; (2) Lifting Within R2; (3) Lifting Within R3; (4) Lifting Within Harbor	Ch. 13, Pt. 2 and Ch. 2, Pt. 10 of the Rules, Rules for Lifting Appliances of Ships and Offshore Installations
Salvage Ship	Salvage ships	Ships provided with equipment for salvaging sunken ships or other objects	Ch. 13, Pt. 2 of the Rules
Rescue Ship	Rescue ships	Ships engaged in rescue operations at sea for ships and crew in distress	Ch. 24, Pt. 8 of the Rules
Pile Driving Barge	Pile-driving barges	Barges fitted with pile driving equipment at end or centre of deck, dedicated to pile driving in water	Ch. 13, Pt. 2 of the Rules
Dredger	Dredgers	Ships fitted with dredging equipment, in general not operating independently	Ch. 14, Pt. 2 of the Rules
Trailing Suction Hopper Dredger	Trailing suction dredgers	Ships fitted with drag head and other dredging equipment	
Cutter Suction Dredger	Cutter suction dredgers	Ships fitted with cutter head and other dredging equipment	
Bucket Dredger	Bucket dredgers	Ships fitted with bucket and other dredging equipment	
Grab Dredger	Grab dredgers	Ships fitted with one or more grab machines	
Dipper Dredger	Dipper dredgers	Ships fitted with dippers. Where a back hoe is fitted, the notataion "Back-hoe Dredger" may also be assigned	
Cutter Wheel Dredger	Cutter wheel dredgers	Ships fitted with cutter-wheel dredging apparatus	
Reclamation Craft	Reclamation craft	Ships fitted with suction pipes, nozzles, etc.	
Split Hopper Dredger	Split hopper dredgers	Ships with entire main hull being opened along longitudinal centerline for unloading	
Hopper Barge	Hopper barges	Barges dedicated to carrying mud. If self-propelled, the word "ship" is to be used in place of the word "barge"	
Split Hopper Barge	Split hopper barges	Barges with entire main hull being opened along longitudinal centerline for unloading. If self-propelled, the word "ship" is to be used in place of the word "barge"	
Wave Pierce Craft	Wave piercing craft	A special type of catamaran high | HSC are ships with maximum speed not less	Rules for Construction and Classification of

Class notation	Description			Technical requirements②
		speed craft with large aspect ratio and small waterplane area	than $3.7\nabla^{0.1667}$ m/s. For passenger ships as defined in 2.1.3.1(18) of Rules for Construction and Classification of Sea-Going High Speed Craft, the service notation Passenger A is to be added after type notation and where such ships are fitted with ro-ro spaces or special category spaces, the notation Ro-Ro Passenger A is to be added. For passenger ships as defined in 2.1.3.1(19) of Rules for Construction and Classification of Sea-Going High Speed Craft, the service notation Passenger B is to be added after type notation and where such ships are fitted with ro-ro spaces or special category spaces, the notation Ro-Ro Passenger B is to be added. For high speed cargo craft, the notation Cargo is to be added after type notation	Sea-Going High Speed Craft
Air Cushion Craft	Air cushion craft	High speed craft wholly supported by air cushion		
Surface Effect Ship	High speed surface effect craft (side wall hovercraft)	High speed craft with its air cushion being totally or partially retained by permanently immersed hard structure		
Trimaran HSC	High speed trimaran craft	A vessel with three hulls of displacement form, a main centre hull stabilized by two much smaller side hulls, connected by connection bridge		
Catamaran HSC	High speed catamaran craft	High speed craft with upper parts of two parallel hulls being connected by strength framing		
Mono-Hull HSC	High speed mono-hull craft	High speed craft with a single hull		
Hydrofoil Craft	Hydrofoil craft	Ships supported completely clear above water surface in non-displacement mode by hydrodynamic forces generated on foils		
SWATH-HSC	High speed small waterplane area twin hull craft	A special type of catamaran with small waterplane area, and with underwater portions of hulls being formed in shape of torpedo		Guidelines for Small Waterplane Area Twin Hull Craft
SWATH	Small waterplane area twin hull craft	A special type of catamaran with small waterplane area, and with underwater portions of hulls being formed in shape of torpedo		
Wing In Ground Craft	Wing-in-ground craft	Ships, which are supported by using ground effect above the water or some other surface, without constant contact with such a surface and supported in the air, mainly, by an aerodynamic lift generated on a wing (wings) which are intended to utilize the ground effect action, must be assigned this type notation with one of following suffixes being added thereafter: A — for craft certified for operation only in ground effect; B — for craft certified to temporarily increase its altitude to a limited height beyond ground effect but not exceeding a certain distance		Guidelines for Survey of Wing-in-Ground Craft
Passenger Boat	Passenger boats	Boats carrying more than 12 passengers		Rules for Classification of Sea-going Boats
Cargo Boat	Cargo boats	Boats used for carrying cargoes		Rules for Classification of Sea-going Boats
Non-propulsion Boat	Non-propulsion boats	Boats not fitted with propulsion equipment for the purpose of navigation		Rules for Classification of Sea-going Boats
Sailing Boat	Sailing boats	Boats for which the primary means of propulsion is by wind power	Where more than 12 passengers are carried,	Rules for Classification of Sea-going Boats
Tourist Boat	Tourist boats	Boats fitted with sightseeing		Rules for Classification

Class notation	Description			Technical requirements②
		areas and for the purpose of sightseeing	technical requirements for passenger ships need to be satisfied, unless special provisions are specified by the Administration. In this case, only the Passenger Boat notation is assigned	of Sea-going Boats
Windfarm Service Boat	Windfarm service boats	Boats used for offshore windfarm service		Rules for Classification of Sea-going Boats
Wooden Boat	Wooden boats	Boats the main hull of which is constructed with wooden materials		Rules for Classification of Sea-going Boats
Passenger Submersible Craft	Submersible passenger craft	Self-propelled free submersibles transporting or carrying passengers and capable of underwater sightseeing		Rules for Classification of Diving Systems and Submersibles
Rigid Connection PB Combination — Pusher	Rigid combination: Pusher tug	A combination consisting of a pusher tug and a barge wherein the pusher tug is secured in the barge notch by mechanical means. There is no relative motion between the tug and the barge, resulting in the two vessels acting as a single unit in a seaway. The pusher tug is a component part of the combination		Ch. 7, Pt. 8 of the Rules
Rigid Connection PB Combination — Barge	Rigid combination: Barge	A combination consisting of a pusher tug and a barge wherein the pusher tug is secured in the barge notch by mechanical means. There is no relative motion between the tug and the barge, resulting in the two vessels acting as a single unit in a seaway. The barge is a component part of the combination		Ch. 7, Pt. 8 of the Rules
Articulated Connection PB Combination — Pusher	Articulated combination: Pusher tug	A combination consisting of a pusher tug and a barge wherein the pusher tug is secured in the barge notch by mechanical means, allowing pitch between the tug and the barge in only one degree of freedom. The two vessels act as a single unit in a seaway and when disconnected from each other, both may moor or operate independently. The pusher tug is a component part of the combination		Ch. 7, Pt. 8 of the Rules
Articulated Connection PB Combination — Barge	Articulated combination: Barge	A combination consisting of a pusher tug and a barge wherein the pusher tug is secured in the barge notch by mechanical means, allowing pitch between the tug and the barge in only one degree of freedom. The two vessels act as a single unit in a seaway and when disconnected from each other, both may moor or operate independently. The barge is a component part of the combination		Ch. 7, Pt. 8 of the Rules
Aquatic Product Carrier	Aquatic product carriers	Dedicated to transporting aquatic products, characterized by using physical media such as ice, instead of refrigerating plant, for cold storage of aquatic products, with insulation layers fitted on inner surface of holds		Ch. 2, Pt. 2 of the Rules
Yacht	Pleasure craft	A boat engaged in uncommercial entertainment activities such as touring, leisure and sightseeing. High speed yachts are to be assigned the **High Speed Yacht** notation. Sailing craft constructed in accordance with CCS Guidelines for Survey of Sailing Craft is to be assigned the **Sailing Craft** notation. According to the structural type, the following notations are to be added respectively: ① Mono-Hull ② Catamaran ③ Multi-hull According to the design category, the following notations are to be added respectively:		Rules for Construction and Classification of Yachts

Class notation	Description		Technical requirements②
		① Design Category I（Hs= ×× m）③ ② Design Category II（Hs= ×× m） ③ Design Category III（Hs= ×× m） ④ Design Category IV（Hs= ×× m） ⑤ Design Category V（Hs= ×× m）	
Offshore Engineering Support Ship	Offshore engineering support ships	Ships providing multi-function support to offshore engineering operations, e.g. offshore installation, survey and repair of structures, as well as underwater robot operation, diving operation, etc.	Ch. 2, Pt. 2 of the Rules
Launching Work Barge	Launching work barges	Work barges dedicated to launching ships, offshore installations or other heavy cargoes within shipyard and/or port waters. Such operation may also include cargo moving from water to shore and short-distance movement of cargoes within above- mentioned waters (The ship does not have self-propulsion capability, and movement is driven by other power ships such as tugs or other facilities)	Ch. 17, Pt. 2 of the Rules
Catamaran	Catamarans	Ships with upper parts of two separate hulls being connected by strength framing	Ch. 18, Pt. 2 of the Rules
Sand Carrier	Sand carriers	Ships designed and constructed specifically for the carriage of sand, which is to be surveyed according to the requirements for double hull bulk carrier	Ch. 19, Pt. 2 of the Rules
Diving Support Vessel	Diving support vessels	Ships provided with permanent diving support system to be assigned class notation DSV-Sat (saturation diving system)	Ch. 25, Pt. 8 of the Rules
Icebreaker	Icebreakers	Polar Class ships which are assigned a class notation for having an operational profile that includes escort or ice management functions and powering and dimensions that allow it to undertake aggressive operations in ice-covered waters. Relevant polar class is to be affixed after the class notation, e.g. Icebreaker; PC3	Ch. 13, Pt. 8 of the Rules
Icebreaker*	Strengthened icebreakers	Ships for which relevant requirements are expanded and supplemented regarding general and arrangement, structure, propulsion power, machinery installations, steering systems and equipment based on Icebreaker	Rules for Heavy Icebreakers
Oil FSV fixed at XXX Anchorage	Oil floating storage vessels fixed at anchorage	This notation is to be assigned to oil floating storage vessels (FSV) satisfying the following conditions: (1) Double hull oil tankers engaged in cargo oil transportation between various ports / locations; (2) Berthing in a dedicated location, which means the sheltered water area designated by the Administration of the coastal State, or an anchorage location that enables the vessels to quickly move away from a severe weather conditions	Guidelines for Oil Floating Storage Vessels Fixed at Anchorage
Power Barge (X_1, …, X_N)	Power Vessel	The barges or self-propelled ships on which a power plant using natural gas or fuel oil as a fuel is installed to serve as a power generation resource supplying external power. For self-propelled ships, the word 'ship' is to be used in place of the word 'barge'. Meanings of X_N are as follows: Natural Gas Fuel: for power vessels using natural gas as a fuel; HV: for power vessels with an output voltage above 15 kV; S: for power vessels supplying power to ships fitted with high voltage shore connection (HVSC)	Guidelines for Survey of Power Vessels

③ "H_S=××m" means the design significant wave height corresponding to the design category.

Class notation	Description		Technical requirements②
		systems in compliance with IEC 80005-1. Note: The above X_N are all optional	
Fire Fighting Ship N	Fire fighting ships of Grade N	Ships capable of fire fighting are to be assigned this notation, with N being one of the following: 1 – for early stage fire fighting; 2 – for large fire fighting; 3 – for large and oil fire fighting. For ships provided with a water spraying system for delivering efficient cooling water spraying over all the exposed vertical surfaces of the hull so as to enable the ship to approach the burning object for fire-fighting and/or rescue purposes, the notation Water Spraying may be added after the above notation	Ch. 1, Pt. 8 of the Rules
Training Ship	Training ships	Ships dedicated to training of marine personnel	Ch. 2, Pt. 2 of the Rules, Code of Safety for Special Purpose Ships (where applicable)
Fish-Factory Ship	Fisheries processing ships	Specialized in fish processing	
Research Ship	Research ships	Ships specialized in marine research and study, survey, exploration, etc., are to be assigned this notation	Ch. 2 and/or Ch. 9, Pt. 2 of the Rules, Code of Safety for Special Purpose Ships (where applicable)
Oil Recovery Ship with Cargo Tank	Oil recovery ships equipped with means for the recovery and discharge of oil as well as with tanks for storing the recovered oil	Steel ships equipped for the recovery of oil floating on the sea with a flash point not exceeding 60℃ (closed-cup test) and a Reid vapour pressure below atmospheric pressure	Ch. 3, Pt. 8 of the Rules
Oil Recovery Ship without Cargo Tank	Oil recovery ships without tanks for storing the recovered oil and equipped with means for the recovery, but not for discharge of oil	Steel ships equipped for the recovery of oil floating on the sea with a flash point not exceeding 60℃ (closed-cup test) and a Reid vapour pressure below atmospheric pressure	Ch. 3, Pt. 8 of the Rules
Oil Recovery Ship not suitable for products with a flash point of 60℃ and less	Oil recovery ships equipped with means for the recovery of oil with a flash point exceeding 60℃	Steel ships equipped for the recovery of oil floating on the sea with a flash point exceeding 60℃ (closed-cup test) and a Reid vapour pressure below atmospheric pressure	Ch. 3, Pt. 8 of the Rules
Sewage Recovery Vessel	Sewage recovery ships	Ships dedicated to recovery of sewage	Ch. 2, Pt. 2 of the Rules
Well Stimulation	Well stimulation	Offshore engineering support ships used for or designed to be used for the operation of offshore well stimulation	Guidelines for Well Stimulation
LNG Bunkering Ship	LNG bunkering ships	Ships with the function of LNG bunkering	Rules for LNG Bunkering Ships
Windfarm Service Vessel	Windfarm service vessels	Vessels that provide support and guarantee services for the operation and maintenance of offshore wind farms	Ch. 38, Pt. 8 of the Rules
Pontoon	Pontoons	Rectangular flat-bottomed non-self-propelled ships without power units, usually moored stationary along the shore or at a dock, and used as floating installation	Requirements for inshore floating installations in Chapter 6 of Pt. 11 and special requirements for floating parking installation in Pt. 14 of

Class notation	Description		Technical requirements②
			the Rules for Classification of Offshore Floating Installation

Special Duties Notations **Table B**

Class notation	Description		Technical requirements①
Traffic Ship②	Traffic ships	For transporting personnel, but not as passenger transport service	1. For ships not less than 20 m in length, in accordance with Ch. 2, Pt. 2 of the Rules; for high speed craft, in accordance with Rules for Construction and Classification of Sea-Going High Speed Craft. 2. For ships less than 20 m in length, in accordance with Rules for Classification of Sea-going Boats. In this case, sea-going boats are only assigned Traffic Boat notation. 3. For transporting more than 12 personnel, in accordance with technical requirements for passenger ships, unless specially provided by the Administration. In this case, sea-going boats are only assigned Passenger Boat notation
Public Affair Ship	Public affair ships	Ships used for administrative purposes of the Government	1. For ships not less than 20 m in length, in accordance with Ch. 8, Pt. 8 of the Rules; for high speed craft, in accordance with Rules for Construction and Classification of Sea-Going High Speed Craft. 2. For ships less than 20 m in length, in accordance with Rules for Classification of Sea-going Boats. In this case, sea-going boats are only assigned Public Affair Boat notation. 3. For ships carrying more than 12 passengers, in accordance with technical requirements for passenger ships. In this case, sea-going boats are only assigned Passenger Boat

① The technical requirements listed in this Table are the basic ones for ships assigned to the notation; in other special cases involving ship types, special consideration is to be given by CCS according to the ship's specific conditions.

② The notation "Crew Boat" is used for traffic ships flying the flag of Saint Vincent and Grenadines.

Class notation	Description		Technical requirements①
			notation. 4. Where special provisions are specified by the Administration, such provisions are to be implemented for paragraphs 1 to 3 above
× Boat	Work boats	Ships dedicated to specific services. × is to be substituted by a specific service, e.g.: Pilot Boat: Ships dedicated to pilot service; Anchor Boat: Ships dedicated to operations related to anchoring and mooring; Light Boat: Ships dedicated to serving as navigational marks; Diving Boat: Work boats dedicated to diving operations	1. For ships not less than 20 m in length, in accordance with Ch. 2, Pt. 2 of the Rules; for high speed craft, in accordance with Rules for Construction and Classification of Sea-Going High Speed Craft. 2. For ships less than 20 m in length, in accordance with Rules for Classification of Sea-going Boats. 3. For ships carrying more than 12 passengers, in accordance with technical requirements for passenger ships. In this case, sea-going boats are only assigned Passenger Boat notation
SPS	Special purpose ships	This notation may be assigned to ships for which the Special Purpose Ship Safety Certificate is issued according to IMO Code of Safety for Special Purpose Ships or a standard acceptable to the Administration. This notation may be assigned separately, or as a special duty notation for certain ship types	Code of Safety for Special Purpose Ships or a standard acceptable to the Administration
IP	International ships carrying industrial personnel	This notation may be assigned to ships for which the Industrial Personnel Safety Certificate is issued according to IMO Code of Safety for Ships Carrying Industrial Personnel	International Code of Safety for Ships Carrying Industrial Personnel
Cruise	Cruise ships	For sea-going passenger ships which provide travel and leisure services, e.g. culture, sports, dining, shopping, accommodation and sightseeing for passengers through various living and recreational facilities provided on board, the notation “Cruise” may be added after the class notation “Passenger Ship”. Other ships (e.g. ro-ro passenger ships) having functions of cruise ship may also be assigned corresponding class notations in relation to cruise ships	Ch. 2, Ch. 3 and Ch. 4 of Rules for Cruise Ships

Service or Service Restriction Notations **Table C**

Class notation	Description			Technical requirements
R1	Service category 1	Within 200 (summer / tropical*) or 100 (winter*) n mile off the shore	1.*Seasonal areas as specified in Annex II to the International Convention on Load Lines, 1966. **Sheltered waters include the sea areas between an island and the shore and	Chapter 0, Pt. 10 of the Rules
R2	Service category 2	Within 20 (summer / tropical*) or 10 (winter*) n mile off the		

Class notation	Description			Technical requirements
		shore	between islands with a distance of less than 10 n miles in between, which forms a comparatively good sheltered or similar condition with a little wave. 2.Working ships may be assigned service categories applicable for transit and operation respectively, e.g. R2 for Transiting and R3 for Operation. 3.For ships engaged on non-international voyages, notations for service category 1/2/3 are R1(D)/ R2(D)/ R3(D) respectively	
R3	Service category 3	Sheltered waters**		
×× — ×× service	Specified route service	On specified route service, e.g. Shanghai — Osaka Service		The Rules
SZ(XX)	Specific service area	Strength assessment of container ships and ore carriers with specific service area in accordance with the Guidelines for Strength Assessment of Ships with Specific Service Area or Service Route or Service Life. Where XX is service area identification, e.g. SZ(Bohai)		Guidelines for Strength Assessment of Ships with Specific Service Area or Service Route or Service Life
SL(XX-YY)	Strength assessment of ships with specific service route	Strength assessment of container ships and ore carriers with specific service route in accordance with the Guidelines for Strength Assessment of Ships with Specific Service Area or Service Route or Service Life. Where XX and YY are names of arrival and departure ports and other restricted information (e.g. information on port of call/location) for ships with specific service route, e.g. SL (Yantai-Dalian)		Guidelines for Strength Assessment of Ships with Specific Service Area or Service Route or Service Life
Open Sea Service Restriction	Open sea service restriction	The service in the sea area within 300 nautical miles off the shore, and a passenger craft does not proceed in the course of its voyage more than 4 h, or a cargo craft 8 h, at operational speed from a place of refuge when fully laden. Where the sea state of some service areas above-mentioned is heavier, more stringent requirements may be made by CCS to the distance above-mentioned, depending on the specific cases. When special provisions for the service area are stipulated by the Administration of the flag State or by the coastal Authority in charge of the service area, the provisions are to be observed.		Rules for Construction and Classification of Sea-Going High Speed Craft
Greater Coastal Service Restriction	Greater coastal service restriction	For craft engaged on voyages in the sea area within 200 nautical miles off the shore, which proceed in the course of a voyage for a time specified below, at operational speed from a place of refuge when fully laden: ① not more than 4 h for passenger craft; ② not more than 8 h for cargo craft		Rules for Construction and Classification of Sea-Going High Speed Craft, Rules for Classification of Sea-going Boats
Coastal Service Restriction	Coastal service restriction	For craft engaged on voyages in the sea area within 20 nautical miles off the shore, which proceed in the course of a voyage for a time specified below, at operational speed from a place of refuge when fully laden: ① not more than 4 h for passenger craft; ② not more than 8 h for cargo craft		Rules for Construction and Classification of Sea-Going High Speed Craft, Rules for Classification of Sea-going Boats
Sheltered Water Service Restriction	Sheltered water service restriction	For craft engaged on voyages in the sea areas between islands and the shore and between islands with a distance of less than 10 n miles in between, which forms a comparatively good sheltered condition with a little wave, or within 10 nautical miles off the shore. Such craft do not proceed in the course of a voyage more than 2 h at operational speed from the shore when		Rules for Construction and Classification of Sea-Going High Speed Craft, Rules for Classification of Sea-going Boats

Class notation	Description		Technical requirements
		fully laden, with wind force not exceeding Beaufort scale 6 and visual wave height not more than 2.0 m	
Calm Water Service Restriction	Calm water service restriction	For craft engaged on voyages in the sea areas within 5 nautical miles off the shore. Such craft do not proceed in the course of a voyage more than 2 h at operational speed from the shore when fully laden, with wind force not exceeding Beaufort scale 6 and visual wave height not more than 1.0 m	Rules for Construction and Classification of Sea-Going High Speed Craft, Rules for Classification of Sea-going Boats
Weather Restriction N	Weather restriction	Weather restriction for wing-in-ground craft, with N being one of the following: I: Significant wave height not exceeding 3.0 m and wind force not exceeding Beaufort scale 7 for the restricted service II: Significant wave height not exceeding 2.0 m and wind force not exceeding Beaufort scale 6 for the restricted service III: Significant wave height not exceeding 1.0 m and wind force not exceeding Beaufort scale 5 for the restricted service IV: Significant wave height not exceeding 0.5 m and wind force not exceeding Beaufort scale 4 for the restricted service	Guidelines for Survey of Wing-in-Ground Craft
Dredging Within R3	Operation within R3 service area	Restricted service area for dredgers	Ch. 2, Pt. 10 of the Rules
Dredging Within R2	Operation within R2 service area	Restricted service area for dredgers	Ch. 2, Pt. 10 of the Rules
Dredging Within R1	Operation within R1 service area	Restricted service area for dredgers	Ch. 2, Pt. 10 of the Rules
Dredging Within Harbor	Operation in harbor water only	Restricted service area for dredgers	Ch. 2, Pt. 10 of the Rules

Cargo and Loading Characteristics Notations **Table D**

Class notation	Description		Technical requirements
BC-A	Harmonized notation BC-A	Bulk carriers are to be assigned this notation, provided they ① are designed to carry dry bulk cargoes of density 1.0 t/m^3 and above; ② have specified holds empty at maximum draught; ③ have BC-B requirements included in loading conditions	Ch. 8, Pt. 2 of the Rules For CSR ships, in accordance with Ch. 1, Pt. 9-1 of the Rules
BC-B	Harmonized notation BC-B	Bulk carriers are to be assigned this notation, provided they ① are designed to carry dry bulk cargoes of density of 1.0 t/m^3 and above; ② have all cargo holds loaded; ③ have BC-C requirements included in loading conditions	Ch. 8, Pt. 2 of the Rules For CSR ships, in accordance with Ch. 1, Pt. 9-1 of the Rules
BC-C	Harmonized notation BC-C	Bulk carriers are to be assigned this notation, provided they ① are designed to carry dry bulk cargoes of density less than 1.0 t/m^3	Ch. 8, Pt. 2 of the Rules For CSR ships, in accordance with Ch. 1, Pt. 9-1 of the Rules
Maximum cargo density x.y t/m^3)	Maximum cargo density x.y t/m^3	This notation is to be added after a harmonized notation to show the limitation when maximum design cargo density for bulk carrier is less than 3.0 t/m^3, and maximum allowed cargo density is to be indicated. This notation is applicable only to BC-A and BC-B. For general dry cargo ships intended to carry cargoes in bulk, this notation is assigned to show the limitation when maximum design bulk cargo density is less than 3.0 t/m^3, and maximum allowed bulk cargo density is to be indicated	Ch.2 or Ch. 8, Pt. 2 of the Rules For CSR ships, Ch. 1, Pt. 9-1 of the Rules

Class notation	Description		Technical requirements
No MP	No loading and unloading in multiple ports	This notation is to be added after a harmonized notation to show the limitation when the bulk carrier has not been designed for loading and unloading in multiple ports in accordance with the Rules. This notation is applicable to all harmonized notations BC-A, BC-B, BC-C. This notation is to be assigned to show the limitation when the ore carrier has not been designed for loading and unloading in multiple ports in accordance with the Rules. For general dry cargo ships intended to carry cargoes in bulk, this notation is assigned to show the limitation when the bulk cargo loading condition has not been designed for loading and unloading in multiple ports in accordance with the Rules	Ch.2 or Ch. 8 or Ch.16, Pt. 2 of the Rules For CSR ships, Ch. 1, Pt. 9-1 of the Rules For ore carriers of 250 m and over in length and engaged in unrestricted service, in accordance with Chapters 6 and 7 of Rules for Structures of Ore Carriers
Holds Nos. ×××a, b, … may be empty	Holds Nos. ×××a, b, … may be empty	This notation is to be added after a harmonized notation when specified empty holds are allowed in design of bulk carrier to specify the empty hold No.. The notation is applicable only to BC-A. For general dry cargo ships intended to carry cargoes in bulk, this notation may be assigned to specify the empty hold No. when specified empty holds are allowed in design of bulk cargo loading condition	Ch.2 or Ch. 8, Pt. 2 of the Rules For CSR ships, Ch. 1, Pt. 9-1 of the Rules
Block loading	Block loading	This notation is to be added after a harmonized notation when the design condition of the bulk carrier allows the loading of two adjacent cargo holds while the cargo holds next to them are empty. The notation is applicable to BC-A	For CSR ships, Ch. 1, Pt. 9-1 of the Rules
Holds Nos. ××× May Be Empty With Restrictions Imposed By SOLAS XII/14	Restrictions from sailing with any hold empty	Existing ships, if not meeting the structural strength requirements for with standing flooding of any one cargo hold as specified in SOLAS regulation XII/5.1 and the strength standards and renewal criteria for single-side skin construction as specified in resolution MSC.168(79), are not to sail with any cargo hold loaded to less than 10% of the hold's maximum allowable cargo weight when in the full load condition, on and after 1 July 2006 or reaching 10 years of age, whichever is later	SOLAS XII/14
Max. Cargo Density ××× t/m^3	Maximum cargo density associated with a full tank ××× t/m^3	For bulk chemical tankers, scantlings of structural members of cargo tanks are determined to the maximum design pressure, maximum cargo temperature and maximum cargo density associated with a full tank, in accordance with the characteristics of cargoes intended to be carried. Where the maximum permissible pressure/vacuum relief valve setting (gauge) of all tanks is combined with the associated maximum cargo density, the combination is to be marked: Max. Pressure XX MPa & Max. Cargo Density YY t/m^3 Where the maximum permissible pressure/vacuum relief valve setting (gauge) of a certain group of tanks is combined with the associated maximum cargo density, the combination is to be marked: Max. Pressure XX MPa & Max. Cargo Density YY t/m^3 for Cargo Tanks No.ZZa, ZZb	Rules for Construction and Equipment of Ships Carrying Dangerous Liquid Chemicals in Bulk
Max. Pressure ××× MPa	Maximum pressure ××× MPa		
Max. Cargo Temperature ×××℃	Maximum cargo temperature ×××℃		
Max. Cargo Density ××× t/m^3	Maximum cargo density ××× t/m^3	For liquefied gas carriers, scantlings of structural members of cargo tanks are determined to the maximum design pressure, maximum cargo density and minimum cargo temperature, in accordance with the characteristics of cargoes intended to be designed to be carried	Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk
Max. Vapour Pressure ××× MPa	Maximum vapour pressure ××× MPa		
Min. Cargo Temperature ×××℃	Minimum cargo temperature ×××℃		

Class notation	Description		Technical requirements
Max. Cargo Density in ××× Tank (×× t/m^3)	Maximum cargo density in tank	××× tank is designed to carry liquid cargo of density less than ×× t/m^3, the notation is only to be added after "Offshore Supply Ship"	Sec 13, Ch. 2, Pt. 2 of the Rules
EL100	Easy loading	Ore carriers meeting the requirements for easy loading may be assigned this notation	Ch. 16, Pt. 2 of the Rules; for ore carriers of 250 m and over in length and engaged in unrestricted service, in accordance with Section 2, Chapter 12 of Rules for Structures of Ore Carriers
INF 1	Aggregate activity of INF cargo carried	For the ships which are certified to carry INF cargo with an aggregate activity less than 4,000 TBq	Guidelines for Survey of Irradiated Nuclear Fuel Carriers
INF 2		For the ships which are certified to carry irradiated nuclear fuel or high-level radioactive wastes with an aggregate activity less than 2×10^6 TBq and ships which are certified to carry plutonium with an aggregate activity less than 2×10^5 TBq	
INF 3		For the ships which are certified to carry irradiated nuclear fuel or high-level radioactive wastes and ships which are certified to carry plutonium with no restriction of the maximum aggregate activity of the materials	
NEV Carriage (X)	Carriage of new energy vehicles	The notation is assigned to vehicle carriers and ro-ro passenger ships ro-ro carrying new energy vehicles which comply with the Technical Guidelines for the Safety of Ro-ro Carriage of New Energy Vehicles(NEVs). X means the type of NEVs, which may be B, H, N, or a combination of them. B stands for lithium battery-powered electric vehicles, H for hydrogen-powered vehicles, and N for natural gas-powered vehicles.	Technical Guidelines for the Safety of Ro-ro Carriage of New Energy Vehicles
SOLAS XII	SOLAS XII bulk cargo loading	The notation is assigned to ships intended to carry dry cargo in bulk, with a configuration different from that defined in 8.1.1.1, Chapter 8, Pt. 2 of the Rules, provided that the requirements of Chapter 37, Pt. 8 of the Rules are satisfied	Chapter 37, Pt. 8 of the Rules

Special Features Notations **Table E**

Class notation	Description		Technical requirements
Strengthened for Heavy Cargoes	Strengthened for heavy cargoes	Ships with longitudinal framing for strength deck and bottom within cargo area, and double bottom and strengthening for bottom framing within cargo area, may be assigned this notation. For ore carriers of 250 m and over in length and engaged in unrestricted service, this notation is mandatory for strengthening of double bottom and bottom framing within cargo area. Where the requirements of Section 3 [3], Chapter 12 of Rules for Structures of Ore Carriers are satisfied, (IB) suffix may be added after this notation	1. Sec. 22, Ch. 2, Pt. 2 of the Rules 2. For ore carriers of 250 m and over in length and engaged in unrestricted service, in accordance with Section 3, Chapter 12 of Rules for Structures of Ore Carriers
COMPASS	COMPASS	For ships the design of which has been checked using CCS COMPASS-Structure software, one or more of the following suffixes R, D and F are to be added. Meanings of the suffixes are as follows: R: for ships the check of which against rules has been performed using COMPASS-Structure; D: for ships of which hull structure direct calculations have been performed using COMPASS-Structure; F: for ships of which hull structure fatigue strength assessment has been performed using	COMPASS-Structure software

Class notation	Description		Technical requirements
		COMPASS-Structure. Such notation is necessary for CSR ships	
ERS	Emergency response service	Upon prior ERS agreement between the owner and CCS and an electronic database for stability and structural strength of a ship, CCS will in case of emergency of the ship, e.g. collision at sea, grounding, oil spillage, etc., and at request of the owner, initiate an emergency response procedure to provide calculation and analysis for damage stability, structural strength and spillage, giving technical support to the ship in getting out of danger and recommendations to the owner/master in making final decision	ERS agreement or statement signed by shipping company or shipping operator and CCS is to be provided onboard the ships①
ERS*	Emergency response service	Where ERS agreement or statement is signed by shipping company or shipping operator and ERS onshore service unit designated by the Administration, the notation may be added with the application of the owner	ERS agreement or statement signed by shipping company or shipping operator and ERS onshore service unit designated by the Administration is to be provided onboard the ships
Icebreaking	Capable of breaking ice	Operation in first-year ice conditions and having independent icebreaking capability. This notation is to be used in conjunction with ice notations and added before the type notation, e.g. Icebreaking Tug, Ice Class B1	Ch. 9, Pt. 8 of the Rules
Bottom Strengthened for Operating Aground	Bottom strengthened for operating aground	Bottom of dredgers strengthened for operating aground	Ch. 14, Pt. 2 of the Rules
GRAB [X]	Structural strengthening for loading/unloading by grabs	Strengthening of inner bottom plating, lower strake of hopper tank sloping plate and transverse lower stool plating for holds designed for loading/unloading by grabs having a maximum weight up to × tons ×-unladen grab weight	Sec. 1, Ch. 1, Pt. 9-1 of the Rules
Grab*(×)	Structural strengthening for loading/unloading by grabs	Strengthening of inner bottom plating, lower strake of hopper tank sloping plate and transverse lower stool plating for holds of non-CSR ships designed for loading/unloading by grabs having a maximum weight up to × tons ×-unladen grab weight For ore carriers of 250 m and over in length and engaged in unrestricted service, this notation is mandatory, meaning strengthening of inner bottom plating, lower strake of longitudinal bulkhead and transverse lower stool plating for holds of ships designed for loading/unloading by grabs having a maximum weight up to × tons ×-unladen grab weight	1. Sec. 23, Ch. 2, Pt. 2 of the Rules 2. For ore carriers of 250 m and over in length and engaged in unrestricted service, in accordance with Section 4, Chapter 12 of Rules for Structures of Ore Carriers
CSR	Common Structural Rules	For ships designed and constructed in accordance with Common Structural Rules, this notation is to be added after type notation	Pt. 9 or 10 of the Rules (2012 version) and its 2013 and 2014 amendments or Pt. 9 of the Rules (2015 version) and its subsequent versions (including amendments)
Stainless Steel	Stainless steel	Cargo spaces of bulk chemical tankers are constructed of stainless steel	Rules for Construction and Equipment of Ships Carrying Dangerous Liquid Chemicals in Bulk
Lined with Corrosion Resistant Lining	Lined with corrosion resistant lining	Cargo spaces of bulk chemical tankers are fitted with corrosion resistant lining	
PSPC	Protective coating	Ships of which specific spaces comply with IMO Performance Standard for Protective Coatings	PSPC(B) and PSPC(D) are to comply with the

① Refer to IACS Rec.145 “Recommendation for the Operation of Shore-Based Emergency Response Services”.

Class notation	Description		Technical requirements
		may be assigned this notation, with one or more of suffixes B, C, D and V being added thereafter. Meanings of the suffixes are as follows: B: protective coatings applied in dedicated seawater ballast tanks of all types of ships; C: protective coatings applied in cargo oil tank spaces of crude oil tankers; D: protective coatings applied in double-side skin spaces; V: protective coatings applied in void spaces of bulk carriers and oil tankers. Note: B, C, D and V can operate both separately and together	requirements of IMO resolution MSC.215(82); PSPC(C) is to comply with the requirements of IMO resolution MSC.288(87); PSPC(V) is to comply with the requirements of IMO resolution MSC.244(83)
SOLAS II-2 Reg. 19	Fit for carriage of dangerous goods	Ships fit for carriage of dangerous goods in packaged form or solid dangerous goods in bulk and holding a certificate of fitness for carriage of dangerous goods, may be assigned this notation at the request of the owner	SOLAS Reg. II-2/19
AS	Autonomous ships	Ships complying with the Guidelines for Autonomous Cargo Ships are assigned this notation, which is appended to the ship type notation. For ships designed and constructed in accordance with the Common Structural Rules, it is appended to the class notation CSR	Guidelines for Autonomous Cargo Ships
SAF	Hull structure fatigue strength assessment taking into account linear springing	This notation may be assigned to large ships subject to hull structure fatigue strength assessment taking into account linear springing in accordance with the relevant technical requirements *Notes:* *1. for container ships satisfying the relevant requirements in 1.1.3, Appendix A of Rules for Structures of Container Ships, hull structure fatigue strength assessment taking into account linear springing is carried out, and this notation is mandatory;* *2. for ore carriers satisfying the relevant requirements in 1.1.3, Appendix A of Rules for Structures of Ore Carriers, hull structure fatigue strength assessment taking into account linear springing is carried out, and this notation is mandatory*	Guidelines for Direct Calculation Assessment of Springing and Whipping of Hull Structures *Notes:* *1. for container ships engaged in unrestricted service and of 150 m and over in length, in accordance with Appendix A of Rules for Structures of Container Ships* *2. for ore carriers engaged in unrestricted service and of 250 m and over in length, in accordance with Appendix A of Rules for Structures of Ore Carriers*
SWAF	Hull structure fatigue strength assessment taking into account whipping and springing	This notation may be assigned to large ships subject to hull structure fatigue strength assessment taking into account whipping and springing in accordance with the relevant technical requirements *Notes:* 1. *for container ships satisfying the relevant requirements in 1.1.3, Appendix A of Rules for Structures of Container Ships, hull structure fatigue strength assessment taking into account whipping and springing is carried out, and this notation is mandatory;* 2. *for ore carriers satisfying the relevant requirements in 1.1.3, Appendix A of Rules for Structures of Ore Carriers, hull structure fatigue strength assessment taking into account whipping and springing is carried out, and this notation is mandatory;*	Guidelines for Direct Calculation Assessment of Springing and Whipping of Hull Structures *Notes:* 1. *for container ships engaged in unrestricted service and of 150 m and over in length, in accordance with Appendix A of Rules for Structures of Container Ships* 2. *for ore carriers engaged in unrestricted service and of 250 m and over in length, in accordance with Appendix A of Rules for Structures of Ore Carriers*
WAU	Hull girder ultimate strength	This notation may be assigned to large ships subject to hull girder ultimate strength assessment	Guidelines for Direct Calculation Assessment of

Class notation	Description		Technical requirements
	assessment taking into account whipping	taking into account whipping in accordance with the relevant technical requirements *Notes:* 1. *for container ships satisfying the relevant requirements in 1.1.3, Appendix A of Rules for Structures of Container Ships, hull girder ultimate strength assessment taking into account whipping is carried out, and this notation is mandatory;* 2. *for ore carriers satisfying the relevant requirements in 1.1.3, Appendix A of Rules for Structures of Ore Carriers, hull girder ultimate strength assessment taking into account whipping is carried out, and this notation is mandatory*	Springing and Whipping of Hull Structures *Notes:* 1. *for container ships engaged in unrestricted service and of 150 m and over in length, in accordance with Appendix A of Rules for Structures of Container Ships;* 2. *for ore carriers engaged in unrestricted service and of 250 m and over in length, in accordance with Appendix A of Rules for Structures of Ore Carriers*
Anchor Handling	Handling of anchors	Ships capable of handling anchors	Ch. 20, Pt. 8 of the Rules
CM	Monitoring of construction of hull structure	Ships for which the control of structural precision at critical locations of hull (including alignment, fitting-up, edge treatment and technological standards) is in accordance with an approved plan. For tankers and bulk carriers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10 (Goal-based ship construction standards for bulk carriers and oil tankers) this class notation is necessary	Guidelines for Construction Monitoring of Hull Structures
PC1	Operation in polar waters covered by multi-year ice	Year-round operation in all polar waters	Ch. 13, Pt. 8 of the Rules
PC2		Year-round operation in moderate multi-year ice conditions	
PC3		Year-round operation in second-year ice which may include multi-year ice inclusions	
PC4		Year-round operation in thick first-year ice which may include old ice inclusions	
PC5		Year-round operation in medium first-year ice which may include old ice inclusions	
PC6		Summer/autumn operation in medium first-year ice which may include old ice inclusions	
PC7		Summer/autumn operation in thin first-year ice which may include old ice inclusions	
PC X(y)		After obtaining one of the polar class from PC7 to PC2, the notation “PC X(y)” may be assigned when one or more hull regions longitudinally divided of a polar class ship are of a higher polar class, where X is the polar class level and y is the longitudinal region of hull, which may be taken as : B: bow region BI: bow intermediate region M: midbody region S: stern region E.g. PC 6; PC 3(BI, M) means that structures of bow intermediate and midbody regions are strengthened to a higher PC3 after the ship obtains PC6	
ARC-M(x)	Higher strength steel for polar ships	When higher strength steels are used for hull structures exposed to weather and sea, this class notation may be assigned, where x indicates the design service temperature	Rules for Heavy Icebreakers

Class notation	Description		Technical requirements
Ice Class B1*	Operation in waters covered by first-year ice①	Operation in severe ice conditions, not requiring ice breaker assistance. Maximum and minimum ice class draughts fore, amidships and aft, and minimum required main engine output to be stated in classification certificate	Ch. 4, Pt. 2 / Ch. 14, Pt. 3 of the Rules②
Ice Class B1		Operation in severe ice conditions and if necessary, with ice breaker assistance. Maximum and minimum ice class draughts fore, amidships and aft, and minimum required main engine output to be stated in classification certificate	
Ice Class B2		Operation in moderate ice conditions and if needed, with ice breaker assistance. Maximum and minimum ice class draughts fore, amidships and aft, and minimum required main engine output to be stated in classification certificate	
Ice Class B3		Operation in light ice conditions and if needed, with ice breaker assistance. Maximum and minimum ice class draughts fore, amidships and aft, and minimum required main engine output to be stated in classification certificate	
Ice Class B		Operation in very light ice conditions and if needed, with ice breaker assistance	
WD (××.×× m)	Operating draft (××.×× m)	Marking the operating draft assigned to floating cranes, dredgers and hopper barges, with the value in the brackets indicating the maximum draft allowed for operations of these working ships, in m	Sec. 13, Ch. 1, Pt. 2 of the Rules
FL	Minimum design fatigue life	Where a ship is designed for a minimum design fatigue life of 25 years or more, the class notation FL may be assigned at 5-year intervals starting from the 25th year, e.g. FL (25), FL (30) *Note: for container ships engaged in unrestricted service and of 150 m and over in length and ore carriers engaged in unrestricted service and of 250 m and over in length, this notation is mandatory, with suffix (XX, YY) added as follows:* *XX - wave environmental conditions of ship operation, WW is taken for the environmental condition based on global wave spectrum and NA is taken for the environmental condition based on North Atlantic wave spectrum;* *YY - fatigue design life, in year; the minimum design fatigue life is 25 years, which may be taken at 5-year intervals starting from the 25th year.* *E.g., FL(NA, 25) means that design life of 25 years under North Atlantic wave environment*	Guidelines for Fatigue Strength of Ship Structure *Notes:* 1. *for container ships engaged in unrestricted service and of 150 m and over in length, in accordance with Chapter 10 of Rules for Structures of Container Ships;* 2. *for ore carriers engaged in unrestricted service and of 250 m and over in length, in accordance with Chapter 10 of Rules for Structures of Ore Carriers*
MCRS	Corrosion resistant steel	Corrosion resistant steel is used as an alternative to protective coating for cargo oil tanks of crude oil tankers in accordance with IMO resolution MSC.289(87)	Relevant requirements of the Guidelines for Survey of Corrosion Resistant Steel of Cargo Oil Tanks in Crude Oil Tankers
Strengthened for Deck Cargoes	Strengthened for deck cargoes	The deck structure of specified deck cargo area is designed to be strengthened. The permissible loads, in ××× t/m^2, in cargo area of strengthened deck are to be indicated in operation documents	The cargo deck plating in deck cargo area to comply with the requirements of 11.3.2 of Sec. 3, Ch. 11, Pt. 2 of the Rules. The cargo deck framing in deck cargo area to comply with the requirements for cargo deck plating as specified in Sec. 4, Ch. 11, Pt. 2 and Sec. 8, Ch. 2, Pt. 2 of the Rules

① Such as Northern Baltic Sea in winter, Bohai Sea in winter and Northern Huanghai Sea in winter.

② Attention is to be paid to relevant special requirements of international industrial organizations and oil companies.

Class notation	Description		Technical requirements
ACC (DST)	Ships operating in low air temperature environments	The basic Anti-Cold Climate notation, applicable for ships intended to operate in non-polar waters in low air temperature environments	Ch. 23, Pt. 8 of the Rules
ACC-POLAR (DST)		The polar Anti-Cold Climate notation, applicable for ships intended to operate in polar waters in low air temperature environments	
H (DST)		The hull Anti-Cold Climate notation, applicable for materials used for hull structures of ships intended to operate in low air temperature environments	
DE-ICE		The DE-ICE notation, applicable for ships operating occasionally in low air temperature environments and in addition, for ships operating in areas and during periods where more severe ice and snow accretion are likely to occur	
DSV-Air	Air diving support system	Ships provided with air diving system may be assigned this notation	Ch. 25, Pt. 8 of the Rules
DSV-Sat	Saturation diving support system	Ships provided with saturation diving system may be assigned this notation	Ch. 25, Pt. 8 of the Rules
SFA	Spectrum-based fatigue strength assessment	This notation is optional and applies to large membrane tank LNG carriers, container ships and ore carriers. Class notation SFA (XX, YY) may be assigned after assessment in accordance with the relevant technical requirements . XX refers to environmental condition (e.g.: NA refers to North Atlantic Ocean, see IACS Rec.34 for scatter diagram), YY refers to design life (year), may be taken as 20, 25, 30, 35 or 40. *Note: for container ships engaged in unrestricted service and of 150 m and over in length and ore carriers engaged in unrestricted service and of 250 m and over in length, the suffix is explained as follows:* *XX - wave environmental conditions of ship operation, WW is taken for the environmental condition based on global wave spectrum and NA is taken for the environmental condition based on North Atlantic wave spectrum;* *YY - fatigue design life, in year; the minimum design fatigue life is 25 years, which may be taken at 5-year intervals starting from the 25th year*	Guidelines for Spectrum-based Fatigue Assessment of Hull Structure *Notes:* *1. for container ships engaged in unrestricted service and of 150 m and over in length, in accordance with Appendix 1, Chapter 10 of Rules for Structures of Container Ships* *2. for ore carriers engaged in unrestricted service and of 250 m and over in length, in accordance with Appendix 1, Chapter 10 of Rules for Structures of Ore Carriers*
i-Ship (Ai, Ri, Nx, Hx, Mx, Ex, Cx, I)	Intelligent ships	"i-Ship" intelligent ship class notation is assigned to ships with functions of intelligent navigation, intelligent hull, intelligent machinery, intelligent energy efficiency management, intelligent cargo management, intelligent integration platform, remote control and autonomous operation. Each function corresponds to a functional notation as follows: Ai– functional notation for autonomous operation; Ri– functional notation for remote control; Nx – functional notation for intelligent navigation; Hx – functional notation for intelligent hull; Mx – functional notation for intelligent machinery; Ex – functional notation for intelligent energy efficiency management; Cx – functional notation for intelligent cargo management; I – functional notation for intelligent integration platform; i – numbers such as 1, 2, 3, indicating the scope and degree of remote control and autonomous operation. Only one corresponding number can be selected according to the specific functions of the ship. Detailed requirements are given in Chapters	Rules for Intelligent Ships, Guidelines for Surveys of Intelligent Energy Efficiency Management of Ships, Guidelines for Surveys of Intelligent Machinery of Ships, Guidelines for Surveys of Intelligent Integration Platform of Ships

Class notation	Description		Technical requirements
		8 to 9 of the Rules for Intelligent Ships; x – additional notation for optional function. One small letter stands for one additional notation for function and a functional notation may have multiple additional notations for function, which are to be separated by comma. Detailed requirements are given in Chapters 2 to 7 of the Rules for Intelligent Ships. If one functional notation has already covered the function of another notation, only one notation is assigned.	
		Note 1: Ships, for which i-Ship (E), i-Ship(Es) and i-Ship (Et) class notations are requested, are also to comply with the relevant requirements of Guidelines for Surveys of Intelligent Energy Efficiency Management of Ships; Note 2: Ships, for which i-Ship (Mx) class notation is requested, are also to comply with the relevant requirements of Guidelines for Surveys of Intelligent Machinery of Ships; Note 3: Ships, for which i-Ship (I) class notation is requested, are also to comply with the relevant requirements of Guidelines for Surveys of Intelligent Integration Platform of Ships	
i-Ship (Dx)	Intelligent dredging	For dredgers engaged in dredging operations which are, upon request, in compliance with the provisions of 10.2, Chapter 10 of the Rules for Intelligent Ships subject to CCS plan approval and survey, this notation may be assigned: D – basic function of intelligent dredging specified in 10.2.1.3, Chapter 10 of the Rules for Intelligent Ships; x – additional functional notation, expressed by the following lowercase letters: a – one-key dredging function as specified in 10.2.1.4(1), Chapter 10 of the Rules for Intelligent Ships can be achieved; m – condition-based maintenance is implemented for dredging equipment; o – the optimization function of dredging operation parameters as specified in 10.2.1.4(3), Chapter 10 of the Rules for Intelligent Ships can be achieved	Rules for Intelligent Ships
i-Ship (SRx)	Intelligent scientific research	For scientific research ships engaged in scientific research tasks which are, upon request, in compliance with the provisions of 10.3, Chapter 10 of the Rules for Intelligent Ships subject to CCS plan approval and survey, this notation may be assigned: SR – basic function of scientific research operation management specified in 10.3.4.1, Chapter 10 of the Rules for Intelligent Ships; x – additional functional notation, expressed by the following lowercase letter: c – the scientific research ship has the monitoring function of scientific research operation specified in 10.3.4.2, Chapter 10 of the Rules for Intelligent Ships	Rules for Intelligent Ships
i-Ship(Tx)	Intelligent towing operation	This notation is applicable to harbor tugs having the function of intelligent towing operation. where: T—representing tugs have the basic function for intelligent towing operation; x—additional functional notation, expressed by the following lowercase letters: m—condition-based maintenance function for towing equipment and system;	Chapter 10 of Rules for Intelligent Ships

Class notation	Description		Technical requirements
		s—towing operation coordination function	
i-Ship(Gx)	Intelligent geotextiles laying	This notation is applicable to geotextiles layers having the function of intelligent geotextiles laying operation. where: G — basic function of intelligent geotextiles laying; x — additional functional notation, expressed by the following lowercase letters: a—the one-click geotextiles laying function; m — condition monitoring and health management for geotextiles laying equipment; e — the function of assisted decision-making on energy efficiency optimization of geotextiles laying operations; o—the optimization function of geotextiles laying operation parameters	Chapter 10 of Rules for Intelligent Ships
Cyber Security (M, P[SL0]/S[SL_X])	Cyber security of ships	This notation may be assigned to ships with satisfactory results of the assessment of cyber security of ships, where: M represents compliance with the requirements of ship cyber risk management; P[SL0] represents compliance with minimum ship cyber resilience requirements; S[SL_X] represents compliance with related cyber security requirements corresponding to [SL1/SL2/SL3/SL4], where SL4 is the highest level. *Note: for SOLAS ships, Cyber Security (P[SL0]) notation is mandatory*	Guidelines for Ship Cyber Security
CBM(X)	Condition-based maintenance of ship equipment	This notation may be assigned if a condition based maintenance plan of ship's machinery installations or systems is developed in accordance with the analysis and assessment result of the operating condition and health condition of machinery installations or systems of a ship, with one or more notations affixed to identify the equipment for which the condition based maintenance is implemented, e.g. CBM(Cargo Pumps) is the condition based maintenance notation of cargo pumps	Guidelines for Surveys of Intelligent Machinery of Ships
CEDI (Ox, Cx, Fx)	Cruising Experience Design Index	Cruise ships assigned with class notation CEDI is to be affixed with one or more Ox, Cx, Fx marks, the meaning of which are as follows: Ox – passenger occupation, including tonnage per passenger, living area per passenger and passenger to crew ratio; Cx – comfort, including vibration, noise and indoor climate; Fx – passenger leisure facilities, including facilities provided in passenger cabin, passenger public space and recreational and leisure spaces; x is divided into grade 3, 4 and 5, matching the ship hardware such as space arrangement, equipment and system provision corresponding to 3 star and 3 star +, 4 star and 4 star +, 5 star and 5 star + used in the rating of cruise ship industry respectively, so as to achieve passenger occupation, comfort and functional needs required by relevant star rating at the design and construction stage of cruise ships	Ch. 5 of Rules for Cruise Ships
SEDI (x)	Sanitation Ensurance Design Index	Cruise ships comply with the requirements of Sanitation Ensurance Design Index may be assigned notation SEDI (x); Requirements in relation to hygiene and health , such as for galley and dining room, food storage, potable water, garbage, solid and medical waste,	Ch. 6 of Rules for Cruise Ships

Class notation	Description		Technical requirements
		medical facilities, indoor environment are put forward; x is divided into grade 3, 4 and 5, matching the ship hardware such as space arrangement, equipment and system provision corresponding to 3 star and 3 star +, 4 star and 4 star +, 5 star and 5 star + used in the rating of cruise ship industry respectively, so as to achieve passenger occupation, comfort and functional needs required by relevant star rating at the design and construction stage of cruise ships	
PVSED	Passenger and vehicle separated embarkation and disembarkation	Ro-ro passenger ships provided with arrangements of passenger and vehicle separated embarkation and disembarkation	Ch. 30, Pt. 8 of the Rules
ESA	Enhanced Shaft Alignment	This applies to bearings which are white-metal lined and oil lubricated, and ships applying for enhanced shaft alignment (ESA) notation	Appendix 1 of Ch. 12, Pt. 3 of the Rules
EPC N(SVS, NPR, HIT, TAS)	Epidemic Prevention and Control of Ships	Ships complying with epidemic prevention and control guarantee functions specified in the Guidelines for Epidemic Prevention and Control of Ships may be assigned the class notations for epidemic prevention and control upon request, and optional functional notations are included in the parenthesis, where: N—ship's Epidemic Prevention and Control level (N= 1 or 2 or 3, 3 being the highest level); SVS—functional notation for Sanitary Ventilation System; NPR— functional notation for Negative Pressure isolation Room; HIT—functional notation for Health Investigation and Thermometry System; TAS—functional notation for Telemedicine Assistant System	Guidelines for Epidemic Prevention and Control of Ships
SGISC(X)	Second generation intact stability criteria	Sea-going ships engaged on international voyages complying with relevant requirements for second generation intact stability criteria given in Section 9, Ch. 1, Pt. 2 of the Rules may be assigned this notation, where x represents one or more notations of each sub-elements specified as follows: PR_N: parametric rolling failure mode; PL_N: pure loss of stability failure mode; EA_N:excessive acceleration failure mode; DS_N: dead ship condition failure mode; SRB_N: surf-riding/broaching failure mode where: N=1, meaning all loading conditions comply with Level 1 vulnerability criteria; N=2, meaning all loading conditions comply with Level 2 vulnerability criteria; N=M, meaning that there are loading conditions which do not meet the vulnerability criteria, and information on the stability of ship in waves has been prepared for the master	Section 9, Ch. 1, Pt. 2 of the Rules
ASMW	Operational guidance for ships in high sea conditions	The likelihood of different modes of navigation safety failures under the combined or separate action of wind and waves is assessed by using methods based on hydrodynamics, to determine sailing conditions that may affect safety and prepare operational guidance for ships in high sea conditions for the master's reference	Sec. 9, Ch. 1, Pt. 2 of the Rules
AQM(PM N)	Air quality management of ship compartment	Indicating the concentration level of particulate matter in the air of the compartment of the ship that has obtained the AQM notation, including the	Sections 2 and 3, Chapter 2 of the Guidelines for Monitoring and

Class notation	Description		Technical requirements
		inhalable particulate matter PM10 and the fine particulate matter PM2.5 monitoring factor	Evaluation of Ship Compartment Air Quality and Biohazard Factors
AQM(HFG N)	Air quality management of ship compartment	Indicating the concentration level of hazardous substances in the air of the compartment of the ship that has obtained the AQM notation. The monitoring factors include formaldehyde, benzene, toluene, xylene, total volatile organic compounds (TVOC), and carbon dioxide	Sections 2 and 3, Chapter 2 of the Guidelines for Monitoring and Evaluation of Ship Compartment Air Quality and Biohazard Factors
AQMS(PM N)	Air quality on-line monitoring system	Indicating the concentration level of particulate matter in the air of the compartment of the ship that has obtained the AQMS notation, including the inhalable particulate matter PM10 and the fine particulate matter PM2.5 monitoring factor, and the ship is provided with air quality on-line monitoring system	Sections 2 and 3, Chapter 2, and Sections 1 and 3, Chapter 4 of the Guidelines for Monitoring and Evaluation of Ship Compartment Air Quality and Biohazard Factors
AQMS(HFG N)	Air quality on-line monitoring system	Indicating the concentration level of hazardous substances in the air of the compartment of the ship that has obtained the AQMS notation. The monitoring factors include formaldehyde, benzene, toluene, xylene, total volatile organic compounds (TVOC), and carbon dioxide, and the ship is provided with air quality on-line monitoring system	Sections 2 and 3, Chapter 2, and Sections 1 and 3, Chapter 4 of the Guidelines for Monitoring and Evaluation of Ship Compartment Air Quality and Biohazard Factors
ABM(BAS N)	Air bioaerosol health management of ship compartment	Indicating the concentration level of bioaerosol in the air of the compartment of the ship that has obtained the ABM notation, monitoring factors include total number of bacterial colony, and the ship is provided with bioaerosol on-line monitoring system of ship compartment	Sections 2 and 3, Chapter 2, and Sections 2 and 3, Chapter 4 of the Guidelines for Monitoring and Evaluation of Ship Compartment Air Quality and Biohazard Factors
DL(XX)	Specific service life	Strength assessment of container ships and ore carriers with specific service life in accordance with the Guidelines for Strength Assessment of Ships with Specific Service Area or Service Route or Service Life. Where XX is design life, in years, to be less than 20, e.g. DL (15)	Guidelines for Strength Assessment of Ships with Specific Service Area or Service Route or Service Life
Data Quality(X)	Ship data quality	Evaluating that the data retained by the shipboard system meets the relevant technical requirements	Sections 2, 3 and 4 of Chapter 3 of Guidelines for Quality Assessment of Ship Data
GFE	Global finite element strength assessment	1.The class notation is mandatory for container ships complying with one of the following conditions: 1) Length L greater than 250 m; 2) Hatch breadth of strength deck greater than 0.89B; 3) Unconventional structural arrangement. The class notation is optional for other container ships. 2.The class notation is mandatory for ore carriers complying with one of the following conditions: 1)Length L greater than 350 m; 2)Unconventional structural arrangement. The class notation is optional for other ore carriers	1. Chapter 8 of Rules for Structures of Container Ships 2. Chapter 8 of Rules for Structures of Ore Carriers
LIQ(X)	Cargo liquefaction	Where an ore carrier is designed to carry cargoes (e.g. iron ore, etc.) with a moisture content exceeding the Transportable Moisture Limit (TML) which may lead to cargo liquefaction during transportation, the assignment of this notation is mandatory.	Appendix 1, Chapter 12 of Rules for Structures of Ore Carriers

Class notation	Description			Technical requirements
		X — corresponding to the condition under which all cargo holds are designed to carry type A cargo, which may be taken as 1 or 2. For ore carriers with some cargo holds designed to carry liquefied cargo, the suffix “Holds a,b,...” is to be added after LIQ(X), which is identified by LIQ(X, Holds a,b,...), e.g. LIQ(1, Holds NO. 1,3, 5)		
Underwater Noise N	Underwater radiated noise for ships relying on hydro-acoustic equipment to perform the essential service function	For ships relying on hydro-acoustic equipment to perform the essential service function, the class notation for underwater radiated noise can be assigned if the measured underwater noise meet the requirements. N means underwater radiated noise level, N=1, 2 or 3, in which 1 represents the highest level of underwater radiated noise		Guidelines for Underwater Radiated Noise of Ships
Specific Communication Network (Px,Rx)	Ship communication networks satisfying specific needs	The specific communication needs such as passenger using the Internet and remote survey are realized through the arrangement of ship communication network equipment on board, based on hosting modes of communication networks such as satellite broadband communication network and 4G or 5G cellular communication network. The specific meanings are as follows: P - network provided for passengers to satisfy the daily communication needs of passengers to use the Internet (Passenger). R - network provided for crew to satisfy the communication needs for ship remote survey (Remote). x - additional notations for hosting modes of ship communication networks. Each small letter indicates one hosting mode. The ship communication network satisfying one specific need may be realized by one or more hosting modes, which may be assigned one or more additional notations where: s - ship communication network realized by satellite broadband communication network. c - ship communication network realized by 4G or 5G cellular communication network		Chapter 33, Pt. 8 of the Rules
COLL	Evaluation of collision resistance capability of ships	This notation may be assigned to ships for which the evaluation of collision resistance capability is carried out to side structures of sea-going ships in accordance with the relevant requirements of “evaluation of collision resistance capability of ships”		Chapter 34, Pt. 8 of the Rules
DGP-F	Fire-fighting of dangerous goods in packaged form	This notation is assigned to domestic navigation container ships carrying dangerous goods in packaged form that meet the Guidelines for Fire Fighting and Stowage of Domestic Container Ships Carrying Dangerous Goods in Packaged Form		Guidelines for Fire Fighting and Stowage of Domestic Container Ship Carrying Dangerous Goods in Packaged Form
ALY	Aluminum alloy materials	This notation is assigned to ships, the main hull of which is made of aluminum alloy materials	The following sea-going ships of 20 meters and above in length and engaged in restricted service: (1) passenger ship; (2) ferry; (3) traffic ship; (4) public affair ship.	Guidelines for Structure of Non-high-speed All-aluminum Alloy Sea-going Ships
			High speed crafts of 20 meters and above in length	Rules for Construction and Classification of Sea-Going High Speed Craft

Class notation	Description			Technical requirements
			Yachts engaged in uncommercial entertainment activities such as touring, leisure and sightseeing	Rules for Construction and Classification of Yachts
FRP	Fiber reinforced plastics	This notation is assigned to ships, the main hull of which is made of fiber reinforced plastics	High speed craft of 20 meters and above in length	Rules for Construction and Classification of Sea-Going High Speed Craft
			Yachts engaged in uncommercial entertainment activities such as touring, leisure and sightseeing	Rules for Construction and Classification of Yachts
EVA	Simplified evacuation analysis	Ships for which the design of escape routes, evacuation arrangements and evacuation performance are evaluated based on simplified evacuation analysis		Guidelines on Evacuation Analysis for Personnel of Passenger Ships
EVA (Adv)	Advanced evacuation analysis	Ships for which the design of escape routes, evacuation arrangements and evacuation performance are evaluated based on advanced evacuation analysis		

Automation Notations **Table F**

Class notation	Description		Technical requirements
AUT-0	Machinery space periodically unattended	Main propulsion machinery remotely controlled from BCS, machinery space including CCS periodically unattended	Ch. 3, Pt. 7 of the Rules
MCC	Central control of machinery spaces	Ships with this notation are to be provided with CCS and LCS. When machinery and electrical equipment are in normal operation, CCS is to be constantly attended by watch-keepers	Sec. 2, Ch. 4, Pt. 7 of the Rules
BRC	Remote control from bridge	Main propulsion machinery remotely controlled from BCS, machinery spaces constantly attended by watch-keepers	Sec. 3, Ch. 4, Pt. 7 of the Rules

Special Equipment and System Notations **Table G**

Class notation	Description		Technical requirements
Equipped with Container Securing Arrangements	Container securing arrangements	Ships other than container ships fitted with container securing arrangements may be assigned this notation	Appendix 1 of Ch. 7, Pt. 2 of the Rules
Emergency Towing Arrangements	Emergency towing arrangements	Tankers provided with emergency towing arrangements may be assigned this notation	Sec. 5, Ch. 3, Pt. 2 of the Rules
Loading Computer	Loading computers	Ships provided with approved loading computers are to be assigned this notation, with one or more of suffixes OA, S, I, G and D being added thereafter. Meanings of the suffixes are as follows: S: Capable of calculating and checking hull strength under various loading conditions; I: Capable of calculating and checking intact stability; G: Capable of calculating and checking stability of grain in bulk; D: Capable of calculating and checking damage stability	Appendices 1 & 2 of Ch. 2, Pt. 2 of the Rules
Equipped with Single Point Mooring	Equipped with single point mooring	Ships equipped with single point mooring connecting installation according to relevant requirements are to be assigned the notation	Mooring Equipment Guidelines of Oil Companies

Class notation	Description		Technical requirements
Connecting Installation	connecting installation		International Marine Forum (OCIMF)
IGS	Inert gas systems	For ships provided with inert gas system. Note: "IGS" has the same meaning as "Inert Gas System"	Ch. 4, Pt. 6 of the Rules
COW	Crude oil washing system	This notation may be added for ships fitted with crude oil washing system	MARPOL Annex I to be complied with, as appropriate
CBT	Clean ballast tank	This notation may be added for ships fitted with clean ballast tanks	MARPOL Annex I to be complied with, as appropriate
SBT	Segregated ballast tank	This notation may be added for ships fitted with segregated ballast tanks. Where segregated ballast tanks are in a protective location, the notation PL is to be added after SBT	MARPOL Annex I to be complied with, as appropriate
Helicopter Facilities	Helicopter facilities	For ships with areas and structures for takeoff and landing of helicopters, and storage, fire protection and oil supply facilities for helicopters, this notation may be added	Sec. 18, Ch. 2, Pt. 2 & Ch. 5, Pt. 6 of the Rules
Electrical Propulsion System	Electrical propulsion systems	For ships fitted with electrical propulsion system, this notation may be added	Ch. 15, Pt. 8 of the Rules For DC power distribution propulsion system, see the Guidelines for Survey of DC Integrated Electrical Systems of Ships
Water Jet Units	Water jet units	For ships fitted with water jet units, this notation may be added	Standard(s) acceptable to CCS, e.g. CB3404-91 "Technical conditions for water jet mixed-flow pump and axial flow pump of ships"
Z-propulsion	Z-propulsion system	For ships fitted with Z-propulsion system, this notation may be added	Ch. 11, Pt. 3 of the Rules
Non-propulsion	Non-propulsion machinery	This notation is assigned to those ships not fitted with propulsion equipment used for main propulsion purposes, and is to be added after the type notation. In case of a type notation indicating that the ship is not self-propelling, e.g. "Barge, Oil Barge, Pontoon Barge, Floating Dock, Hopper Barge, Split Hopper Barge", this notation need not be added	Ch. 11, Pt. 3 of the Rules
Cargo Handling by Conveyer System	Self-unloading systems	For ships fitted with conveyors for cargo handling and capable of self-loading or self-unloading, this notation may be added. In the case of cement carriers fitted with compression operated cargo handling system, this notation may be replaced by the notation Air Slid Conveyer System, as necessary	Rules for Lifting Appliances of Ships and Offshore Installations
Auxiliary Propelling/ Maneuvering Units	Auxiliary propelling/ maneuvering units	For ships fitted with auxiliary propelling / maneuvering units which are intended not for navigation purposes, but only for locally adjusting operation position of the ship or auxiliary propelling during towing, etc., this notation may be added	Ch. 11, Pt. 3 of the Rules
Lifting Appliance	Lifting appliances	Marine lifting appliances. This notation is to be added together with the notation Floating Crane for floating cranes and upon request, for other ships	Rules for Lifting Appliances of Ships and Offshore Installations
PR-N	Redundant propulsion system	Ships, of which the main propulsion machinery and/or the steering gear is provided with redundancy, may be assigned this notation wherein the letter N indicates one of the following cases: 1 – A ship fitted with two or more propulsion machines but only a single propulsor and a single steering system. 2 – A ship fitted with two or more propulsion	Ch. 14, Pt. 8 of the Rules

Class notation	Description		Technical requirements
		machines and also two or more propulsors and two or more steering systems. 1S – A ship fitted with only a single propulsor and a single steering system but having two or more propulsion machines arranged in separate compartments. 2S – A ship fitted with two or more propulsion machines and also two or more propulsors and two or more steering systems, having the propulsion machines, propulsors and associated steering systems arranged in separate compartments	
HMS(x)	Hull monitoring system	This notation may be assigned when monitoring sensors are installed in the hull monitoring system, but also sensors/ components monitoring other parameters are selected, where within the brackets there will be letters specifying the selected sensors/components and multiple letters are separated by a comma ",". The following sensors/ components may be selected for the hull monitoring system: Gn: Sensor monitoring the global hull strain Dn: Sensor monitoring the local hull strain On: Sensor monitoring the propulsion shaft(s) output An: Sensor monitoring the axial acceleration Mn: Device for monitoring of hull rigid body motions (six degrees of freedom) Pn: Sensor monitoring the transient sea pressure acting on the hull (slamming) Sn: Sensor monitoring the liquid motion pressures in tanks (sloshing) Tn: Sensor monitoring the temperature Bn: Device for monitoring the wave Wn: Wind sensor Nn: Navigation sensors Cn: Online link to loading computer that is continuously up-dating the loading condition Ln: Backed up statistics and triggered time series to be sent to CCS periodically Note: n denotes the number of sensors or devices	Ch. 21, Pt. 8 of the Rules
HMS-HSC(x)		This notation may be assigned to the hull monitoring system installed on high speed craft Within the brackets there will be letters specifying the selected sensors/components and multiple letters are separated by a comma ",". The following sensors/ components may be selected for the hull monitoring system: An: Sensor monitoring the axial acceleration Gn: Sensor monitoring the global hull strain Dn: Sensor monitoring the local hull strain Pn: Sensor monitoring the transient sea pressure acting on the hull (slamming) Note: n denotes the number of sensors or devices	
HMS-ICE	Hull monitoring and assistant decision-making system for operations in ice	This notation may be assigned to ships with ice class that are installed with monitoring and decision system according to the requirements of the Guidelines and relevant rules, capable of monitoring stress of structure members in ice belt area during operations in ice and can send a safety alarm when the monitored value and forecasted value approach or exceed safety value, and will provide a suggestion on modification of operation to the Master	Guidelines for Hull Monitoring and Assistant Decision-making System for Operations in Ice
HMS-ICE(×)		This notation may be assigned to ships with ice class provided with hull monitoring and assistant decision-making system for operations in ice which comply with the requirements for monitoring based on non-standard ice operation mode. Turn: the monitoring and decision system that can	

Class notation	Description		Technical requirements
		meet the need for monitoring of structural response in ice belt area during turning of ships in ice; Glancing: the monitoring and decision system that can meet the need for monitoring of hull girder bending and shear during glancing operation of ships in ice; Oblique: the monitoring and decision system that can meet the need for monitoring of structural response in ice belt area during oblique operation of ships in ice; Stern-Ahead: the monitoring and decision system that can meet the need for monitoring of structural response in ice belt area during stern-ahead operation of ships in ice; Shallow-Water: the monitoring and decision system that can meet the need for monitoring of structural response of ship bottom during shallow-water	
ECL	Ergonomic Container Lashing	This notation may be assigned to ships the decks of which are loaded with containers and specially designed for the safety of securing personnel	Ch. 22, Pt. 8 of the Rules
DP-N	Dynamic positioning systems	Vessels with dynamic positioning systems are to be assigned this notation, with N being one of the following: 1 Vessels with dynamic positioning systems can automatically keep their position and heading within specified environmental conditions. In addition, independent centralized manual position control and automatic heading control are to be provided. 2 Vessels with dynamic positioning systems can automatically keep their position and heading in case of a single failure (excluding loss of a cabin or cabins) within specified environmental conditions and operating limits. 3 Vessels with dynamic positioning systems can automatically keep their position and heading in case of a single failure (including total loss of a cabin caused by fire or flooding) within specified environmental conditions and operating limits	Ch. 11, Pt. 8 of the Rules
BDE-1	Bridge design and equipment	The design and working environment of the bridge and equipment provided for each workstation comply with the basic requirements	Ch. 4, Pt. 8 of the Rules
BDE-2		Ships required to be maneuvered at the workstation for docking on the basis of BDE-1	
BDE-3		Ships provided with the Integrated Bridge System (IBS) in addition to complying with the applicable requirements of BDE-2	
CLC	Lashing calculation programme of containers	Ships provided with onboard container lashing calculation programme may be assigned this notation. This notation is optional and suffixes V, W may be added. Meanings of the suffixes are as follows:: V - specified voyage. Ships applying for securing of containers for specified voyage may be assigned the CLC (V) notation; W- specified weather. Ships applying for securing of containers for specified weather may be assigned the CLC (V, W) notation on the basis of CLC (V)	Appendix 1 of Ch. 7, Pt. 2 of the Rules *Note: for container ships engaged in unrestricted service and of 150 m and over in length, in accordance with Chapter 12 of Rules for Structures of Container Ships*
ROVS	Remote operated submersible vehicles	Ships provided with remote operated submersible vehicles may be assigned this notation	Ch. 25, Pt. 8 of the Rules
BioFuel Oil(Bxx, Yn)	Biofuel oil used by the main propulsion system	This notation may be assigned to ships for which biofuel oil is used by the main propulsion system, where: Bxx: indicating the mixing ratio the biofuel oil used being less than or equal to xx, where xx indicates the volume percentage of biofuel in the biofuel mixture. For example, B30 and B100 indicate that the volume	Guidelines for Ships Using Biofuel

Class notation	Description		Technical requirements
		percentage of biofuel in the biofuel mixture is less than or equal to 30% and 100%, respectively. Yn: indicating the type of biofuel, e.g. FAME, FAEE, HVO, SVO etc. Several biofuels may be used at the same time, e.g. BioFuel Oil(B30, FAME; B50, HVO)	
Bow Loading System	Bow loading system	For oil tankers fitted with bow loading system, this notation may be added	Ch. 27, Pt. 8 of the Rules
Bow Loading System*	Bow loading system	For oil tankers fitted with bow loading system, this notation may be added	Sec. 9, Ch. 27, Pt. 8 of the Rules
Semi-submerged Propeller	Semi-submerged propeller	For ships fitted with semi-submerged propellers, this notation may be added	Guidelines for Semi-submerged Propellers
VDMS	Video monitoring system	Ships provided with video monitoring system may be assigned this notation	Ch. 31, Pt. 8 of the Rules
NVE	Night vision equipment	Ships provided with night vision equipment may be assigned this notation	Ch. 31, Pt. 8 of the Rules
EFN-x	Fog navigation enhanced sensing system	Ships provided with fog navigation enhanced sensing system may be assigned this notation, where x is replaced by one of the following: M - manual identification of typical targets; A- intelligent identification of typical targets	Ch. 31, Pt. 8 of the Rules
T-Propulsion	Transverse propulsion system	For ships provided with transverse propulsion arrangement, this notation may be assigned	Ch. 32, Pt. 8 of the Rules
DP-N(CBV/CBNV)	DP systems based on closed bus bars	Ships or offshore installations provided with DP systems are assigned this notation, among which N should be 2 or 3: Abbreviated CBV and CBNV imply: CBV— witnessing of closed bus bars on board; CBNV— witnessing of closed bus bars on board is not necessary. CBV,CBNV could not be assigned simultaneously	Guidelines for DP Systems Based on Closed Bus Bars
LPG Fuel	Using liquefied petroleum gas as fuel	For ships the main propulsion system of which is fueled by liquefied petroleum gas, this notation may be assigned	1. Chapters 1-13 of the Guidelines for Ships Using Liquefied Petroleum Gas as Fuel for ship length ≥20 m 2. Rules for Classification of Sea-going Boats for ship length <20 m
Battery(Power)	Pure Battery-Powered Propulsion	For ships only using pure battery-powered propulsion, this notation may be assigned	1.Rules for Classification of Sea-going Boats for ship length <20 m 2.Rules for Ships Applying Battery as a Power for other ships
Battery(Power-h)	Battery hybrid powered propulsion	For batteries used as partial propulsion power or energy storage source, the notation may be assigned	Rules for Ships Applying Battery as a Power
Power-R	Remote monitoring of battery powered system	For ships capable of sending the parameters of its battery power system, distribution system and electrical propulsion system to the CCS survey and verification platform of battery powered ships, this notation may be assigned	Rules for Ships Applying Battery as a Power
SPV	Solar photovoltaic system	For ships fitted with solar photovoltaic system, this notation may be assigned	1. Ch.2 of Survey Guidelines of Solar Photovoltaic System and Lithium Iron Phosphate Battery System for ship length ≥20 m 2. Rules for Classification of

Class notation	Description		Technical requirements
			Sea-going Boats for ship length <20 m
AMPS	AC shore connection system	The class notation may be assigned to a ship fitted with an AC shore connection system with rated voltages of 15 kV or less for power supply to ships in port. Such systems are capable of transferring load between the shore supply and the ship's electrical power via blackout or temporary parallel running, so as to ensure normal operation of equipment intended to be used when generating sets of the ship are stopped	1. Ch.19, Pt. 8 of Rules for Classification of Sea-going Steel Ships for ship length ≥20 m 2. Rules for Classification of Sea-going Boats for ship length <20 m
EFS	Enhanced fire safety	Container ships and other types of ships carrying containers may be assigned this notation if basic requirements for enhanced fire safety in the Guidelines for Enhanced Fire Safety of Container Ships are satisfied	Guidelines for Enhanced Fire Safety of Container Ships
EFS(X)	Enhanced fire safety	One or more suffixes X may be added to the EFS notation, where X stands for: acc: protection for accommodation, survival craft, embarkation stations and muster stations; fm: provision of deck fixed water monitor systems; fd: provision of temperature monitoring systems for container stowage areas; ws: provision of cargo hold water spraying systems	Guidelines for Enhanced Fire Safety of Container Ships
Rim-driven Thruster	Rim-driven thruster	For ships fitted with rim-driven thrusters complying with the requirements of the Guidelines for Survey of Rim-driven Thruster which are used as the main propulsion, this notation may be assigned	Guidelines for Survey of Rim-driven Thruster
Ammonia Fuel	Using ammonia as fuel	This notation is assigned to ships the main propulsion of which uses ammonia as fuel	Guidelines for Ships Using Ammonia Fuel
AFD Ready 1	Ammonia fuel ready	Principled plan design and approval are carried out to ammonia fuel power system ready	
AFD Ready 2		Detailed plan design and approval are carried out to ammonia fuel power system ready	
AFD Ready 2(X)		Based on satisfying the requirement of AFD Ready 2, equipment or system related to ammonia fuel power system have been fitted on board. The X stands for one or more added suffixes, which refers to: ① The letter S in capital means that relevant hull structure and the supporting structure of ammonia fuel tank have been strengthened; ② The letter T in capital means that ammonia fuel tank and containment system have been fitted; ③ The letter E in capital means that the main propulsion engine using ammonia fuel has been fitted; ④ The letter P in capital means that ammonia fuel piping system has been fitted; ⑤ The letter D in capital means that electrical equipment within relevant hazardous areas of ammonia fuel power system meets the corresponding explosion-proof requirements	
FC-FULL	Pure fuel cell power	A ship is only provided with FC power installations without any other main power, such as any main engine/main generating set/power battery. The FC power installations supply power to the ship's electrical equipment	Guidelines for Ships Using Fuel Cell Power Installations
FC-POWER 1	Fuel cell power	A ship is provided both FC power installations and other main power (any main engine/main generating set/power battery etc.), and the former, as part of the main source of electrical power of the ship, supplies	

Class notation	Description		Technical requirements
		power to the ship's electrical equipment	
FC-POWER 2		A ship is provided both FC power installations and other main power (any main engine/main generating set/power battery etc.), and the former, not as part of the ship's main generator, supplies power to the ship's electrical equipment	
HFC Ready 1	Hydrogen fuel cell ready	Principled HFC power installations ready plan design and approval have been carried out to ensure that the ship complies with basic requirements for using HFC power installations in the future, and equipment and system related to HFC power installations are not fitted on board	
HFC Ready 2		Detailed HFC power installations ready plan design and approval have been carried out to ensure that the intended HFC power installations can satisfy relevant requirements of the Guidelines, and equipment and system related to HFC power installations are not fitted on board	
HFC Ready 2(X)		Based on satisfying the requirement of HFC Ready 2, equipment or system related to HFC power installations have been partially fitted on board, subject to CCS survey and approval. The suffix X refers to: ① The letter S in capital means that relevant hull structure has been strengthened and the supporting members of hydrogen fuel tanks/hydrogen cylinders have been fitted; ② The letter P in capital means that the piping system of hydrogen fuel has been fitted; ③ The letter FC in capital means that the cell module of hydrogen fuel has been fitted; ④ The letter D in capital means that the classification of all the hazardous areas related to HFC power installations has been considered and the electrical equipment within the above areas meets the corresponding explosion-proof requirements	
Methanol/Ethanol Fuel	Fueled by methanol/ethanol	This notation may be assigned to power ships the main propulsion system of which is fueled by methanol/ethanol	Guidelines for Ships Using Methanol/Ethanol Fuel
M/E FR (X_1,… , X_N)	Methanol/ethanol fuel ready	This notation is assigned to ships adopting a ready plan of methanol/ethanol fuel, where the meaning of X_N is as follows: S: the hull structure has been strengthened in accordance with the relevant requirements; T: methanol/ethanol fuel containment system and its supporting structure have been fitted; F: methanol/ethanol fuel bunkering station and bunkering system have been fitted; P: methanol/ethanol fuel pipelines and related systems have been fitted, or the relevant requirements for the design and arrangement of methanol/ethanol fuel pipelines for future modification have been fully considered; M: the main engine fitted during ship construction is a dual-fuel engine; m: the main engine fitted during ship construction may be retrofitted as/replaced with methanol/ethanol engine in the future; A: the auxiliary engine fitted during ship construction is a dual-fuel engine; a: the auxiliary engine fitted during ship construction may be retrofitted as /replaced with methanol/ethanol	

Class notation	Description		Technical requirements
		engine in the future; B: the boiler fitted during ship construction is a dual-fuel boiler; b: the boiler fitted during ship construction may be retrofitted as methanol/ethanol boiler in the future; FC: due consideration has been given to relevant requirements for arrangement and fitting of methanol/ethanol fuel cell system during modification; E: the power distribution system of equipment related to methanol/ethanol fuel power system has been reserved during ship construction; D: hazardous areas have been considered during ship construction; C: due consideration has been given to control, monitoring and safety systems of methanol/ethanol fuel during ship construction	
Methanol Bunkering	Methanol bunkering	This notation may be assigned to ships provided with methanol bunkering system	Guidelines for Methanol Bunkering Ships
DFD	Dual fuel engines	This notation may be assigned to liquefied gas carriers fitted with dual fuel engines in compliance with the requirements of the Guidelines for Design and Installation of Gas Fuel Engine Systems of Liquefied Gas Carriers	Guidelines for Design and Installation of Gas Fuel Engine Systems of Liquefied Gas Carriers
GF	Gas fuel only engine	This notation may be assigned to liquefied gas carriers fitted with gas fuel only engines in compliance with the requirements of the Guidelines for Design and Installation of Gas Fuel Engine Systems of Liquefied Gas Carriers	Guidelines for Design and Installation of Gas Fuel Engine Systems of Liquefied Gas Carriers
Natural Gas Fuel	Using natural gas fuels	The notation may be assigned to the ships of which the main propulsion and/or auxiliary machinery uses natural gas or natural gas and oil fuel as a fuel, except for liquefied gas carriers	Rules for Ships Using Natural Gas Fuels
DFDR	Natural gas fuel ready system	A ship assigned with the class notation of DFDR may has one or more suffix(es) of X_N. The meanings of X_N are as follows: H: the hull structures have been strengthened in accordance with the relevant requirements of natural gas fuel powered ships T: the natural gas fuel containment system (bunkers/fuel tanks) and its supporting members have been installed M: the main engine installed in ship's construction is a dual fuel engine m: main engine installed in ship's construction may be converted to a dual fuel engine in future A: the auxiliary engine installed in ship's construction is a dual fuel engine a: the auxiliary engine installed in ship's construction may be converted to a dual fuel engine in future B: the boiler installed in ship's construction is a dual fuel boiler P: the arrangement in ship's construction has been considered the approaching installation of natural gas fuel supply system and related to, including the arrangement of piping, bunkering station, compressor room, gas valve unit, fire-fighting system, etc. E: the power distribution system has been reserved for the equipment related to natural gas fuel powered system in ship's construction D: the gas dangerous zones have been taken into consideration in ship's construction	Guidelines for Natural Gas Fuel Ready Ships
SEC(EGCS)	SOx emission control (exhaust gas cleaning	Ships installed with the EGC systems for reduction of SOx emission can be assigned with SEC(EGCS) notation	Guidelines for Design and Installation of Exhaust Gas Cleaning

Class notation	Description		Technical requirements
	system)		Systems
EGC Ready (X)	Exhaust gas cleaning systems (EGC) Ready	For EGC Ready (X) class notation, the symbol X stands for the type of the EGC system, including: (1) dry desulfurization system, expressed by the capital letter D; (2) open loop exhaust gas cleaning system, expressed by the capital letter O; (3) closed loop exhaust gas cleaning system, expressed by the capital letter C; (4) open-closed hybrid composite system, expressed by the capital letter H. X is to be replaced by one of the four letters above based on the type of the EGC system intended to be installed	Guidelines for Exhaust Gas Cleaning System Ready
LSDF	Low sulphur distillate fuel	Ships intended to use low sulphur distillate fuel with sulphur content not exceeding 0.10% (m/m) may be assigned this notation if the requirements of the Guidelines for Use of Low Sulphur Distillate Fuels in Ships are complied with	Guidelines for Use of Low Sulphur Distillate Fuels in Ships
NEC (SCRS)	NOx emission control (Selective catalytic reduction system)	This notation may be assigned to ships installed with the SCR systems for reduction of NOx emission may be assigned n	Guidelines for Application of Selective Catalytic Reduction (SCR) System Onboard Ships
NEC (EGRS)	NOx emission control (Exhaust Gas Recirculation system)	This notation may be assigned to ships installed with the EGR systems for reduction of NOx emission	Guidelines for Application of Exhaust Gas Recirculation (Egr) Systems Onboard Ships
SCR Ready (X)	Selective catalytic reduction system (SCR) Ready	In assigning class notation SCR Ready(X), X is to be replaced by U or A, the meaning of which are as follows: U: SCR with reductant using aqueous urea solution; A: SCR with reductant using aqueous ammonia	Guidelines for Selective Catalytic Reduction (SCR) System Ready
Hybrid	Hybrid system	Ships with various sources of energy (excluding sails) which can serve as main propulsion power simultaneously, and which do not use lithium-ion batteries and energy type supercapacitors as propulsion power, this notation may be assigned.	Guidelines for Ships Applying Hybrid System
WAP(RWS)	Rigid Wing Sails	This notation may be assigned to wind assisted propulsion unit complying with the requirements of the Guidelines for Evaluation and Survey of Marine Rigid Wing Sails (excluding Chapter 4)	Guidelines for Evaluation and Survey of Marine Rigid Wing Sails
ALDR	Air lubrication drag reduction system	This notation may be assigned, where air lubrication for drag reduction technology is applied on the ship and the requirements of Chapters 1 and 2 of the Guidelines for Surveys of Air Lubrication System for Drag Reduction of Ships are complied with	Guidelines for Surveys of Air Lubrication System for Drag Reduction of Ships
LPGF Ready 1	LPG fuel ready ships	This notation may be assigned when the relevant equipment is not installed onboard and only design and approval of principal plans of LPG fuel ready ships are carried out	Chapter 14 of the Guidelines for Ships Using Liquefied Petroleum Gas as Fuel
LPGF Ready 2		This notation may be assigned when the relevant equipment is not installed onboard and design and approval of detailed plans of LPG fuel ready ships are carried out	
LPGF Ready 2(X)		This notation may be assigned when some of the relevant equipment and system are already installed onboard in addition to compliance with the requirements for LPGF Ready 2. The meanings of the suffix X are as follows: ① the capital letter S indicates that the relevant hull structure and fuel tank support structure have been reinforced; ② the capital letter T indicates that the LPG fuel tank	

Class notation	Description		Technical requirements
		and its containment system have been installed; ③ the capital letter M indicates that the main propulsion engine using LPG fuel has been installed; ④ the capital letter P indicates that the LPG fuel piping system has been installed; ⑤ the capital letter D indicates that the electrical equipment of the fuel power system in relevant dangerous zones is to be explosion-proof	
Telescope Gangway	Telescope Gangway	This notation may be assigned to ships provided with telescope gangway	Guidelines for Marine Telescope Gangway
Ready(X-i)	System and equipment ready	For system and equipment ready with regard to existing class notations, this notation may be assigned, where "X" indicates class notation for existing system and equipment, and "i" indicates different ready levels	Ch. 35, Pt. 8 of the Rules
OCCS	Onboard carbon capture system	For ships fitted with the system to reduce CO_2 emission, this notation may be assigned	Ch. 36, Pt. 8 of the Rules
OCCS Ready 1	Carbon capture system ready	Design and approval of principle drawings are carried out for OCCS ready ship to ensure that the ship is in compliance with the basic requirements for future installation of OCCS, and that no equipment or systems related to carbon capture systems have actually been installed on board	Guidelines for Onboard Carbon Capture Systems
OCCS Ready 2		Design and approval of detailed drawings are carried out for OCCS ready ship to ensure that the OCCS ready is in compliance with the relevant requirements, and that no equipment or systems related to carbon capture systems have actually been installed on board	
OCCS Ready 2(X)		On the basis of meeting the requirements of OCCS Ready 2, the OCCS related equipment and systems have actually been installed on board the ship. The symbol X represents one or more suffixes of class notation, with the following specific meanings: ① The hull structures and related supporting structures have been strengthened, represented by the capital letter S; ② The absorption tower, desorption tower and absorbent circulation system have been installed, represented by the capital letter A; ③ The CO_2 compression and liquefaction system has been installed, represented by the capital letter L; ④ The CO_2 storage tanks have been installed, represented by the capital letter T	
WAP(ROTOR)	Rotor assisted propulsion system	This notation may be assigned to ships provided with the wind-rotor assisted propulsion system	Guidelines for Survey of Marine Wind-Rotor Assisted Propulsion System
RWA	Reduced anchor weight	This notation may be assigned to ships using high holding power anchor or very high holding power anchor to replace ordinary stockless bow anchor, so as to reduce anchor weight	Sec.2, Ch. 3, Pt. 2 of the Rules
PSD	Rotating duct in front of propellers	This notation may be assigned to ships provided with the energy-saving appendages in front of propellers	Sec.8, Ch. 3, Pt. 2 of the Rules

Special Survey Notations **Table H**

Class notation	Description		Technical requirements
ESP	Enhanced survey programme	This notation is required for oil tankers, oil/bulk carriers, oil/bulk/ore carriers, chemical tankers, bulk carriers, self-unloading bulk carriers engaged on international voyages. This notation is optional by the owner for oil tankers, oil/bulk carriers, oil/bulk/ore carriers, chemical tankers, bulk carriers, self-unloading	Ch. 5 of this PART

Class notation	Description		Technical requirements
		bulk carriers subject to ESP and engaged on non-international voyages, with attention being given to the special requirements of the flag States	
In-Water Survey	In-water survey	For ships suitable for in-water surveys, this notation may be assigned. The notation is not applicable to ships of 15 years of age and over with ESP notation	Ch. 12, Pt. 8 of the Rules
CHS	Continuous hull survey	Where continuous survey system for hull is adopted in lieu of special survey and items required in special survey are to be surveyed in regular rotation with uniform annual share within the five-year class period, this notation may be assigned and applies to ships other than general dry cargo ships, oil tankers, combination carriers, chemical tankers and bulk carriers only	Ch. 5 of this PART
CMS	Continuous machinery survey	Where continuous survey system for machinery is adopted in lieu of special survey and items required in special survey are to be surveyed in regular rotation with uniform annual share within the five-year class period, this notation may be assigned	Ch. 5 of this PART
SCM	Screwshaft condition monitoring	This notation may be assigned to oil-lubricated or water-lubricated propeller shafts fitted with approved shaft seals and complying with Appendix 14 "Guidelines for Screwshaft Condition Monitoring System" of Ch. 5 of this PART	Sec. 12 and Appendix 14 "Guidelines for Screwshaft Condition Monitoring System" of Ch. 5 of this PART
ECM	Diesel engine lube oil condition monitoring	This notation may be assigned to ships having lubricating oil condition monitoring system of diesel engines and complying with Appendix 15 "Guidelines for Lubricating Oil Condition Monitoring System of Diesel Engines" of Ch. 5 of this PART. Lubricating oil analysis is to cover lubricating oil in use for cylinders, pistons, piston rings, piston rods, piston pins, crossheads, crosshead pins, guides, crankshafts and all bearings, connecting rods, piston rod stuffing boxes. Results of the analysis is to be used to determine whether an overhaul is necessary analyzed through lube oil according to and other parameters	Appendix 15 "Guidelines for Lubricating Oil Condition Monitoring System of Diesel Engines" of Ch. 5 of this PART
PMS	Planned maintenance scheme (PMS) for machinery	This notation may be assigned to ships for which CCS-approved PMS is adopted as an alternative to special or continuous (if adopted) survey of machinery and electrical installations	Appendix 16 "Guidelines for Survey of Planned Maintenance Scheme (PMS) for Machinery" of Ch. 5 of this PART①
TOFD (B**+J**)	Time of flight diffraction (TOFD)	When the following welds are tested by TOFD, if the testing percentage complies with the following requirements, the corresponding notations may be assigned upon application by the ship owner. TOFD (B**+J**): B** is the percentage of section butt welds tested by TOFD; J** is the percentage of plate butt welds tested by TOFD. The percentage ranges from 20% to 100%, with 10% as the interval, e.g. TOFD(B40%+J20%), PAUT-BUTT (B40%+J20%)……. Survey extent of container ships: butt welds of longitudinal members of torsion box and hatch coaming (thickness $\geqslant$ 35 mm). Survey extent of ore carriers: butt welds of the main	Guidelines for the Application of Time-of-Flight Diffraction (TOFD) and Phased Array Ultrasonic Testing (PAUT) Techniques

① Newbuildings which are assigned PMS notation are to be subject to surveys as specified in appendix 16, Chapter 5, PART ONE of the Rules.

Class notation	Description		Technical requirements
		deck in the cargo area (thickness ≥ 35 mm). Survey extent of LNG and LPG carriers: full penetration welds of integral tanks or independent tanks, excluding membrane tanks and fillet welds). Ships intended for operation in low-temperature areas (such as icebreakers and polar research ships): full penetration butt welds of primary members of the main hull (thickness ≥ 35 mm). Other ships of 150 m and over in length: butt welds of strength deck, top strake, bilge strake, bottom shell, flat plate keel, inner bottom and longitudinal bulkhead topside tank plating as well as primary members supporting these platings within 0.4L amidships (thickness ≥35 mm), butt welds of trunk decks and continuous hatch coamings that can be included in the calculation of hull girder section modulus as well as primary members supporting these platings(thickness ≥35 mm)	
PAUT-Butt(B**+J**)	Butt welds tested by Phased array ultrasonic testing (PAUT)	When the following welds are tested by PAUT, if the testing percentage complies with the following requirements, the corresponding notations may be assigned upon application by the ship owner. PAUT-Butt(B**+J**): B** is the percentage of section butt welds tested by PAUT; J** is the percentage of plate butt welds tested by PAUT. The percentage ranges from 20% to 100%, with 10% as the interval, e.g. TOFD(B40%+J20%), PAUT-BUTT (B40%+J20%)……. Survey extent of container ships: butt welds of longitudinal members of torsion box and hatch coaming (thickness ≥ 35 mm). Survey extent of ore carriers: butt welds of the main deck in the cargo area (thickness ≥ 35 mm). Survey extent of LNG and LPG carriers: full penetration welds of integral tanks or independent tanks, excluding membrane tanks and fillet welds). Ships intended for operation in low-temperature areas (such as icebreakers and polar research ships): full penetration butt welds of primary members of the main hull (thickness ≥ 35 mm). Other ships of 150 m and over in length: butt welds of strength deck, top strake, bilge strake, bottom shell, flat plate keel, inner bottom and longitudinal bulkhead topside tank plating as well as primary members supporting these platings within 0.4L amidships (thickness ≥35 mm), butt welds of trunk decks and continuous hatch coamings that can be included in the calculation of hull girder section modulus as well as primary members supporting these platings(thickness ≥35 mm)	Guidelines for the Application of Time-of-Flight Diffraction (TOFD) and Phased Array Ultrasonic Testing (PAUT) Techniques
PAUT-Fillet (**)	Fillet welds tested by Phased array ultrasonic testing (PAUT)	For bulk carriers (ore carriers), if the length percentage of the following fillet welds tested by PAUT complies with the requirements, the corresponding notations may be assigned upon application by the ship owner. PAUT-Fillet (**)：** is the percentage of full penetration fillet welds ranging from 20% to 100%, with 10% as the interval, e.g. PAUT-Fillet (20%), PAUT-Fillet (30%)……. Survey extent: full penetration welds between the	Guidelines for the Application of Time-of-Flight Diffraction (TOFD) and Phased Array Ultrasonic Testing (PAUT) Techniques

Class notation	Description		Technical requirements
		hopper tank plating of bulk carriers/longitudinal bulkhead of ore carriers and inner bottom plating; full penetration weld connections between lower stool and the inner bottom plating; full penetration weld connections between the lower stool slope plate and lower stool shelf plate; full penetration weld connections between the lower stool shelf plate and transverse bulkhead	
DDV	Ship Digital Survey	This notation may be assigned if the ship has the conditions to carry out inspection by means of digital survey	Guidelines for Application of Ship Digital Survey

Class Notations for Green Eco-Ships ① **Table I-1**

Class notation	Description		Technical requirements
G-EP	Environmental protection	The "G-EP" class notation may be assigned to sea-going ships engaged on international voyages in compliance with applicable international conventions and codes only	Rules for Green-Eco Ships
G-EP (X)		Where it is necessary to indicate further the level of environmental protection, " X" is used to represent the sub-elements as follows: OILx-- control of discharge of oil pollutants, where x is 1 or 2; EAL-- environmental acceptable lubricants; IBTS-- integrated bilge water treatment system; NLSx-- control of discharge of noxious liquid substances, where x is 1 or 2; SC-- control of discharge of sewage; GWC-- control of discharge of grey water; RC-- control of discharge of garbage; NECx-- control of NOx emission, where x is 1 or 2; SEC-- control of SOx emission; VCS/VCS-T-- VOC emission control; RSCx-- control of refrigeration system; INC-- emission control of incineration operation on board; BC20, BC70-- emission control of black carbon; AFS/AFS +-- anti-fouling systems; GPR/GPR+-- green passport; GPR（EU）/GPR（EU）+ -- green passport (EU)	
G-ECO	Ecological protection	The "G-ECO" class notation may be assigned to sea-going ships engaged on international voyages in compliance with applicable international conventions and codes only	Rules for Green-Eco Ships
G-ECO (X)		Where it is necessary to indicate further the level of ecological protection, " X" is used to represent the sub-elements as follows: CDx-- CO_2 emission design index for newbuildings, where "x" represents the percentage ratio of the ship's Attained EEDI value lower than the reference line value for that ship; CDEx-- CO_2 emission design index for ships in service, where "x" represents the percentage ratio of the ship's Attained EEDI value lower than the reference line value for that ship; COM-- CO_2 emission operation management; BWM（T）-- ballast water treatment; BWM（Es）-- ballast water sequential method; BWM（Ef）-- ballast water flow-through method; BWM（Ed）-- ballast water dilution method;	

① Sea-going ships engaged on international voyages.

Class notation	Description		Technical requirements
		BWM（O）-- other management method of ballast water; BIO-- biofouling management; VIBx-- comfort onboard (vibration), where x is 1 or 2 or 3, and 3 means the highest grade; NOIx-- comfort onboard (compartment noise), where x is 1 or 2 or 3, and 3 means the highest grade; CLx-- comfort onboard (indoor climate), where x is 1 or 2 or 3, and 3 means the highest grade; UW-- underwater noise; RN-- ambient noise.	

Class Notations for Green Eco-Ships [①] **Table I-2**

Class notation	Description		Technical requirements
Gd-EP	Environmental protection	The “Gd-EP” class notation may be assigned to sea-going ships engaged on domestic voyages in compliance with the applicable requirements of the Technical Regulations for Statutory Surveys of Sea-going Ships Engaged on Domestic Voyages of the Maritime Safety Administration of the People's Republic of China only	Rules for Green-Eco Ships
Gd-EP (X)		Where it is necessary to indicate further the level of environmental protection, “X” is used to represent the sub-elements as follows: OILx-- control of discharge of oil pollutants, where x is 1 or 2; EAL-- environmental acceptable lubricants; IBTS-- integrated bilge water treatment system; NLSx-- control of discharge of noxious liquid substances, where x is 1 or 2; SC-- control of discharge of sewage; GWC-- control of discharge of grey water; RC-- control of discharge of garbage; NECx-- control of NOx emission, where x is 1 or 2; SEC-- control of SOx emission; VCS/VCS-T-- VOC emission control; RSCx-- control of refrigeration system; INC-- emission control of incineration operation on board; GBEC-- emission control of diesel engine exhaust pollutant; AFS/AFS +-- anti-fouling systems; GPR-- green passport	
Gd-ECO (X)	Ecological protection	The “Gd-ECO(X)” class notation may be assigned to sea-going ships engaged on domestic voyages in compliance with applicable requirements of the Rules for Green Eco-Ships, where “X” represents the sub-elements as follows: CDx-- CO_2 emission design index, where “x” represents the percentage ratio of the ship’s Attained EEDI value lower than the reference line value (RLV) for that ship; COM-- O_2 emission operation management; VIBx-- comfort onboard (vibration), where x is 1 or 2 or 3, and 3 means the highest grade; NOIx-- comfort onboard (compartment noise), where x is 1 or 2 or 3, and 3 means the highest grade; CLx-- comfort onboard (indoor climate), where x is 1 or 2 or 3, and 3 means the highest grade; UW-- underwater noise; RN-- ambient noise.	Rules for Green-Eco Ships

① Sea-going ships engaged on domestic voyages.

Refrigerated Cargo Installation Notations **Table J**

Class notation	Description		Technical requirements
CRS (×× Hold ××℃, ××℃ Max. Sea Water)	Refrigerated cargo	For ships fitted with refrigerated cargo installations, this notation is to be added after type notation, and minimum temperature(s) to be maintained by the installation at maximum sea water temperature stated and cargo area covered by the minimum temperature(s) are to be stated	Ch. 1 to Ch. 3, Pt. 5 of the Rules
CF	Preservation of fruit	For refrigerated installations for cargo fruits, this notation is to be added	Ch. 1 to Ch. 3, Pt. 5 of the Rules
CRC (×× Holds), AC f/WC	Carriage of refrigerated containers in holds	For container ships capable of carrying refrigerated containers in holds, this notation may be added, where: AC — Air-cooled refrigerated containers; f — Simultaneity factor for refrigerating plant; WC — Water-cooled refrigerated containers	Ch. 4, Pt. 5 of the Rules

Other Notations **Table K**

Class notation	Description		Technical requirements
EOM	Ship's energy efficiency real-time on-line monitoring	Capable of monitoring ship's operation in real time and supporting decision on operational energy efficiency management and optimization by collecting operational parameters of ship's energy-consuming equipment and navigational equipment and synchronizing with shore-based equipment	Sec. 7, Ch. 6 of this PART
HIMS	Hull inspection and maintenance scheme	Periodical inspection and maintenance scheme for hull structure and deck equipment. By implementation of scheme, which is implemented by means of computerized management system, improving the management level of crew and superintendent in terms of inspection and maintenance of hull structure and deck equipment, avoiding any impact on the normal operation of ships due to unplanned repair, improving the hull structural safety management level and achieving scientific management of ships	Guidelines for Hull Inspection and Maintenance Scheme
Crew Accommodation (MLC)	Accommodation of crew members	This notation may be assigned to ships meeting the plan approval and construction requirements for accommodation of crew members on board sea-going ships in CCS Guidelines, in addition to statutory requirements for accommodation of crew members	Guidelines for Implementation of Inspections of Maritime Labour Conditions

APPENDIX 2 DIAGRAMS OF MANDATORY SHIP TYPES FOR SHIPS HAVING ESP NOTATION

1 Preamble

1.1 The regime of enhanced surveys as specified in Sections 6, 7 and 8, Chapter 5 of this PART is applicable to a number of ship types falling within the broad definitions of oil tankers, chemical tankers and bulk carriers.

1.2 To clearly indicate to shipowners and the users of CCS Register of Ships those ships which are subject to an enhanced survey programme, the notation ESP is to be added after the type notation assigned to all such ships, built and/or maintained in accordance with the Rules.

1.3 Survey requirements can be found in:

(1) Section 6, Chapter 5 of this PART for oil tankers;

(2) Section 7, Chapter 5 of this PART for single side skin bulk carriers①;

(3) Section 8, Chapter 5 of this PART for chemical tankers;

(4) Section 7, Chapter 5 of this PART for ore carriers, depending on the structural configuration;

(5) Sections 6 and 7, Chapter 5 of this PART for combination carriers (ore/oil and oil/bulk/ore), depending on the structural configuration.

(6) Section 7, Chapter 5 of this PART for self-unloaders, depending on the structural configuration.

2 Ship Type and Enhanced Survey Programme (ESP) Notations

2.1 Oil tanker

The ship type notation "Oil Tanker", or equivalent, and the notation "ESP" are to be assigned to sea-going self-propelled ships② which are constructed with integral cargo tanks and intended primarily to carry oil in bulk. This type notation is to be assigned to tankers of both single and double hull construction, as well as tankers with alternative structural arrangements, e.g. mid-deck designs. Typical midship sections are given in Figure 2.1.

Note: Oil tankers that do not comply with MARPOL I/19 may be subject to International and/or National Regulations requiring phaseout under MARPOL I/20 and/or MARPOL I/21.

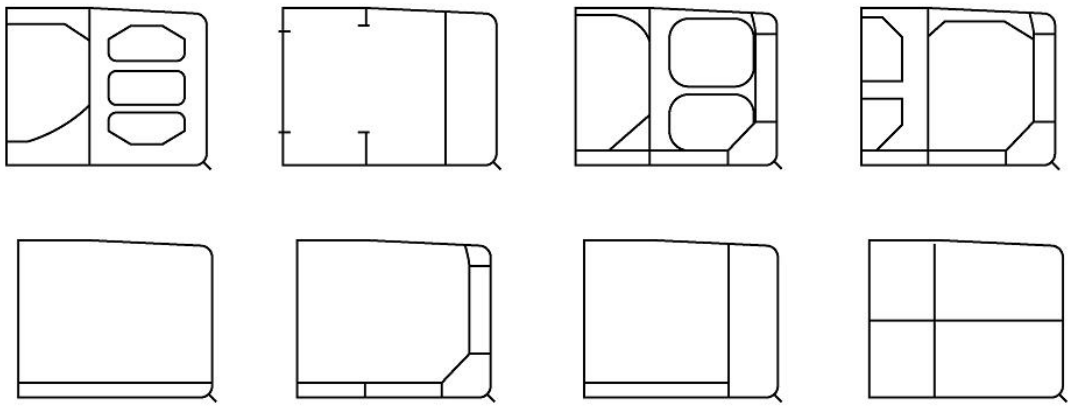


Figure 2.1

2.2 Bulk carrier

The ship type notation "Bulk Carrier", or equivalent, and the notation "ESP" are to be assigned to sea-going self-propelled ships[2] which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in cargo length area and intended primarily to carry dry cargoes in bulk. Typical midship sections are given in Figure 2.2.

---

① For bulk carriers with hybrid cargo hold arrangements, i.e. with some cargo holds of single side skin and others of double side skin, the requirements of Section 7, Chapter 5 of this PART are to apply to cargo holds of single side skin.

② Self-propelled ships are ships with mechanical means of propulsion not requiring assistance from another ship during normal operation.

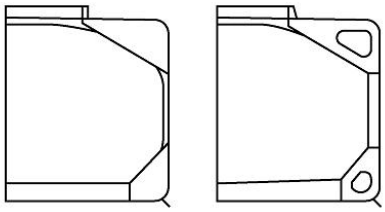

Figure 2.2

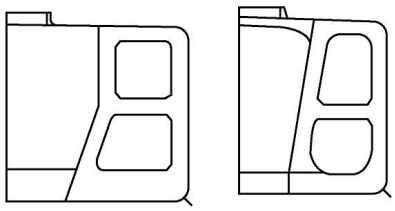

Figure 2.3

2.3 Ore carrier

The ship type notation “Ore Carrier”, or equivalent, and the notation “ESP” are to be assigned to sea-going self-propelled ships① which are constructed generally with single deck, two longitudinal bulkheads and a double bottom throughout the cargo length area and intended primarily to carry ore cargoes in the holds only. Typical midship sections are given in Figure 2.3.

2.4 Combination carrier

(1) “Combination carrier” is a general term applied to ships intended for the carriage of both oil and solid cargoes in bulk; these cargoes are not carried simultaneously, with the exception of oily mixture retained in slop tanks. The ship types defined in (2) and (3) below are to be considered to be combination carriers.

(2) The ship type notation “Ore/Oil Carrier”, or equivalent, and the notation “ESP” are to be assigned to sea-going self-propelled sea-going ships which are constructed generally with single deck, two longitudinal bulkheads and a double bottom throughout the cargo length area and intended primarily to carry ore cargoes in the centre holds or of oil cargoes in centre holds and wing tanks. Typical midship sections are given in Figure 2.4.

Note: Ore/Oil carriers that do not comply with MARPOL I/19 may be subject to International and/or National Regulations requiring phaseout.

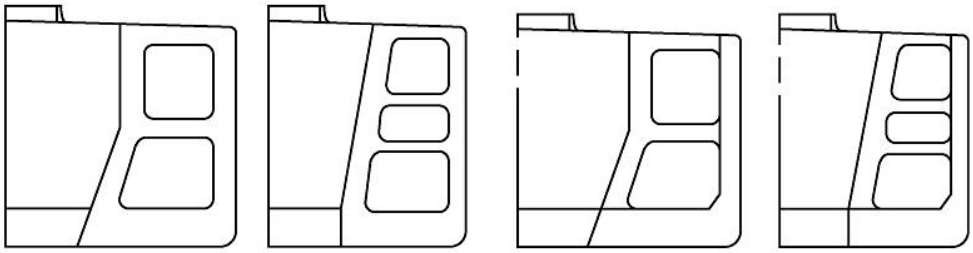

Figure 2.4

(3) The ship type notation “Oil/Bulk/Ore (OBO) carrier”, or equivalent, and the notation “ESP” are to be assigned to sea-going self-propelled ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks, and with single or double side skin construction in the cargo length area, and intended primarily to carry oil or dry cargoes, including ore, in bulk. Typical midship sections are given in Figure 2.5.

Note: Oil/Bulk/Ore carriers that do not comply with MARPOL I/19 may be subject to International and/or National Regulations requiring phaseout.

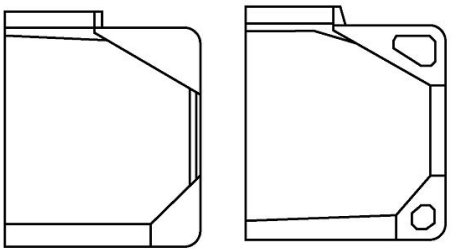

Figure 2.5

2.5 Self-unloaders

The ship type notation “Self-Unloaders", or equivalent, and the notation "ESP" are to be assigned to

① Self-propelled ships are ships with mechanical means of propulsion not requiring assistance from another ship during normal operation.

sea-going self-propelled ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in cargo length area and intended to carry and self-unload dry cargoes in bulk. Typical midship sections are given in Figure 2.6.

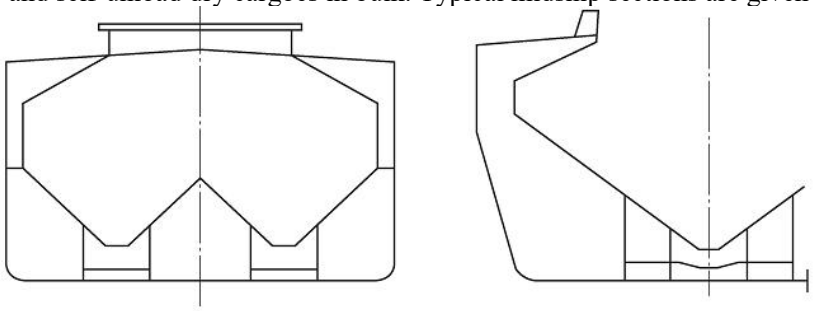

Figure 2.6

2.6 Chemical Tanker

The ship type notation “Chemical Tanker”, or equivalent, and the notation “ESP” are to be assigned to sea-going self-propelled ships which are constructed generally with integral tanks and intended primarily to carry chemicals in bulk. This type notation is to be assigned to tankers of both single or double hull construction, as well as tankers with alternative structural arrangements. Typical midship sections are given in Figure 2.7.

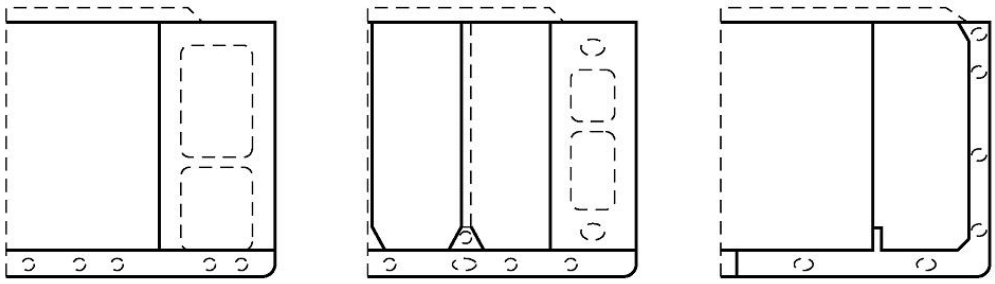

Figure 2.7

CHAPTER 3 INSPECTIONS OF PRODUCTS

Section 1 GENERAL PROVISIONS

3.1.1 General requirements

3.1.1.1 Inspections of products are part of the ship survey, including inspections of products to be classed, delegated inspections of statutory products and entrusted inspections of other products. These inspections are to confirm that the products meet the requirements of the rules for classification or statutory requirements or the requirements of the entrusting party.

3.1.1.2 The products intended for classed ships are to be inspected in accordance with this Chapter and in addition, with relevant Chapters of the Rules and CCS Rules for Materials and Welding.

3.1.1.3 For the products intended for other ships, reference is to be made to provisions of this Chapter.

3.1.1.4 For the products required by the rules, appropriate standards may be accepted as alternative requirements. In any case, however, the equipment, components and systems are to be subject to drawing and document examination, prototype/type test and inspections during manufacturing, testing and functional tests for confirming that they are not less effective than as required by the rules.

3.1.1.5 Where no technical requirements are specified for any products covered by the Rules, they may be designed, manufactured and tested according to applicable standards at the discretion of the manufacturer. The confirmation of technical requirements for such products are in general to include:

(1) drawings and information;

(2) conditions for use on board;

(3) requirements for materials and welding;

(4) test items relating to safety and performance.

3.1.1.6 The manufacturer is to be responsible for compliance with relevant law, regulations, compulsory standards or customers' requirements by the products.

3.1.1.7 Class notations of the product are to be applied by the applicant and assigned by CCS after compliance with CCS relevant provisions is verified by CCS plan approval, approval test and on-site audit.

3.1.2 Definitions

3.1.2.1 For the purpose of products inspections required by the Rules:

(1) **Products inspection** means the process of evaluating the compliance of the products with applicable requirements through drawing examination, prototype/type test, document examination and testing of the final products and/or during their manufacturing, including unit/batch inspection, design approval, type approval and works approval.

(2) **Unit/batch inspection** means the unit-by-unit or batch-by-batch inspection of products by CCS Surveyor for the purpose of issuing a products certificate/equivalent document.

(3) **Design approval (DA)** means the evaluation process whereby CCS confirms that product design meets requirements of CCS rules and/or other acceptable standards through drawing examination and prototype test.

Note: Design approval specified in Chapter 9, PART THREE of the Rules refers to the process of evaluating all drawings, data and calculations related to the diesel engine design. For details, see Chapter 9, PART THREE of the Rules.

(4) **Type approval (TA)** means the evaluation process whereby the manufacturer's ability and condition to produce consistent products in compliance with CCS rules and/or other acceptable standards is confirmed by CCS through drawing examination, type test and on-site audit. Depending on the ability and level of quality assurance of the manufacturer, the type approval is divided into modes A and B.

(5) **Works approval (WA)** means the evaluation process whereby the manufacturer's ability and condition of continuously producing products meeting requirements of CCS rules and/or other acceptable standards are confirmed by CCS through documentation review or drawing examination, type test and on-site audit.

(6) **Type test** means testing of the sample as defined in (9) below including its materials and components by a specified method for confirming compliance with all requirements of technical specifications or designated standard(s).

(7) **Prototype test** means testing of the prototype as defined in (8) below including its materials and components for evaluating the product design.

(8) **Prototype** means a model product manufactured to the design which is to be evaluated for compliance with applicable requirements.

(9) **Sample** means a representative product used for test/inspection. The selected sample is to be, in respect to performance, characteristics and manufacturing quality, capable of representing or covering the products or product series to be inspected.

(10) **Inspection** means the document review, examination and test carried out by the Surveyor for products' compliance with relevant requirements of rules, statutory regulations and standards before commencement and/or during process and/or after completion of production.
(11) **Final inspection** means acceptance inspection and test witnessed by the Surveyor at final stage.
(12) **Applicant** means an organization applying for an inspection of products by CCS. An applicant may be a manufacturer, an agency or a design institute.
(13) **Audit** means a systematic and independent examination to determine whether quality activities and related results comply with planned arrangements and whether these arrangements are implemented effectively and are suitable to achieve the stated objectives.
(14) **Periodical audit** means an audit for confirming continued compliance with the certificate of type approval or the certificate of works approval.
(15) **Additional audit** means an audit carried out by CCS in accordance with the specific requirements. Specific requirements mean situations as deemed necessary by CCS, such as changes to the design, manufacturing process or testing, major production problems or major product delivery problems and reinstatement of the suspended approval certificate.
(16) **Components** mean parts/members forming a piece of equipment and/or a system.
(17) **Design** means all relevant drawings, documents and calculation reports describing the performance, installation and manufacturing technologies of products.
(18) **Documentation** means all necessary written information regarding design, processes, products or services.
(19) **Manufacturer** means an organization producing and/or assembling final products and fully responsible for such products.
(20) **Document** means a formal document showing compliance of a design, product, service or process with specified requirements.
(21) **Manufacturer's document** means statements or certificates issued by the manufacturer as the result of exercising his inspection duty, showing that the products meet relevant requirements.
(22) **Test report** means a document issued by manufacturer, showing that the completed inspection and test of the samples from the existing products has met the requirements for the products.
(23) **Equivalent document** means certificates, reports, etc. issued not in the name of CCS, but stamped by CCS and endorsed by CCS Surveyor, showing that the products have been satisfactorily inspected according to CCS requirements.
(24) **Class notations** indicate different features of a product in sequence, and will be appended on approval and/or product certificates, which are optional.
(25) **Approval of class notations** means that the manufacturer's ability of continuously producing products meeting requirements of CCS additional requirements are confirmed by CCS through documentation review, approval test and on-site audit, which is optional.
(26) **Alternative Certification Scheme (ACS)** means a certification scheme through which classification society will evaluate manufacturer's quality assurance and quality control arrangement and authorize the manufacturer to replace classification society's surveyor in undertaking and witnessing tests after confirming the compliance of the arrangement with the Rules.
(27) **Principle approval** means the evaluation process of confirming the feasibility of the product and/or technology through the review of the technical plan and technical principle of the product design in advance and the necessary verification test. Principle approval is the approval in principle given at the product development stage, and it is a technical certification service that clients voluntarily request CCS to provide during the development of new products and new technologies.

3.1.3 Requirements for manufacturers

3.1.3.1 Manufacturers of classed products used for construction or repair of the ships classed or intended to be classed with CCS are to apply for inspection of such products by CCS.
3.1.3.2 Unless otherwise provided by the Administration of the flag State, manufacturers of statutory products used for construction or repair of the ships, of which CCS is authorized to carry out statutory surveys, are to apply for inspection of such products by CCS.
3.1.3.3 In addition to 3.1.3.1 and 3.1.3.2, CCS may carry out inspections of products for compliance with the standards provided by the applicant (e.g. rules, or SOLAS Convention, or relevant codes of IMO, or provisions of the Administration or standards provided by the applicant).
3.1.3.4 Manufacturers, who apply for approval and inspection by CCS, are to meet appropriate conditions for production, testing, resources and quality management system in accordance with the relevant requirements of this Chapter.
3.1.3.5 Manufacturers are to exercise an effective control over the quality of raw materials, components

and parts of their products, submit to CCS for information lists of suppliers of raw materials, components and parts having direct influence on the quality of their products, and assist CCS in getting necessary information of suppliers. Where CCS rules and guidelines require that raw materials, components and parts should be certified, the related suppliers and their products are to be approved and/or inspected by CCS.

3.1.3.6 Manufacturers are to carry out product manufacturing according to the requirements of CCS Rules and/or approved drawings or technical documents, carry out inspection/test unit-by-unit or by sampling and apply for CCS inspection based on satisfactory judgment.

3.1.3.7 The manufacturer is to notify CCS promptly when any serious quality problems of production or products are found.

3.1.4 Basic requirements for products inspections

3.1.4.1 The products required by CCS rules are, prior to their use or installation on ships classed with CCS or during their manufacturing, to be inspected according to relevant requirements to confirm compliance with CCS rules, and an appropriate certificate as specified in 3.1.5.2 is to be issued.

3.1.4.2 CCS implements the following 3 modes of products approval (approval process as shown in Figure 3.1.4.2):

(1) design approval;

(2) type approval, as type approval A and type approval B;

(3) works approval.

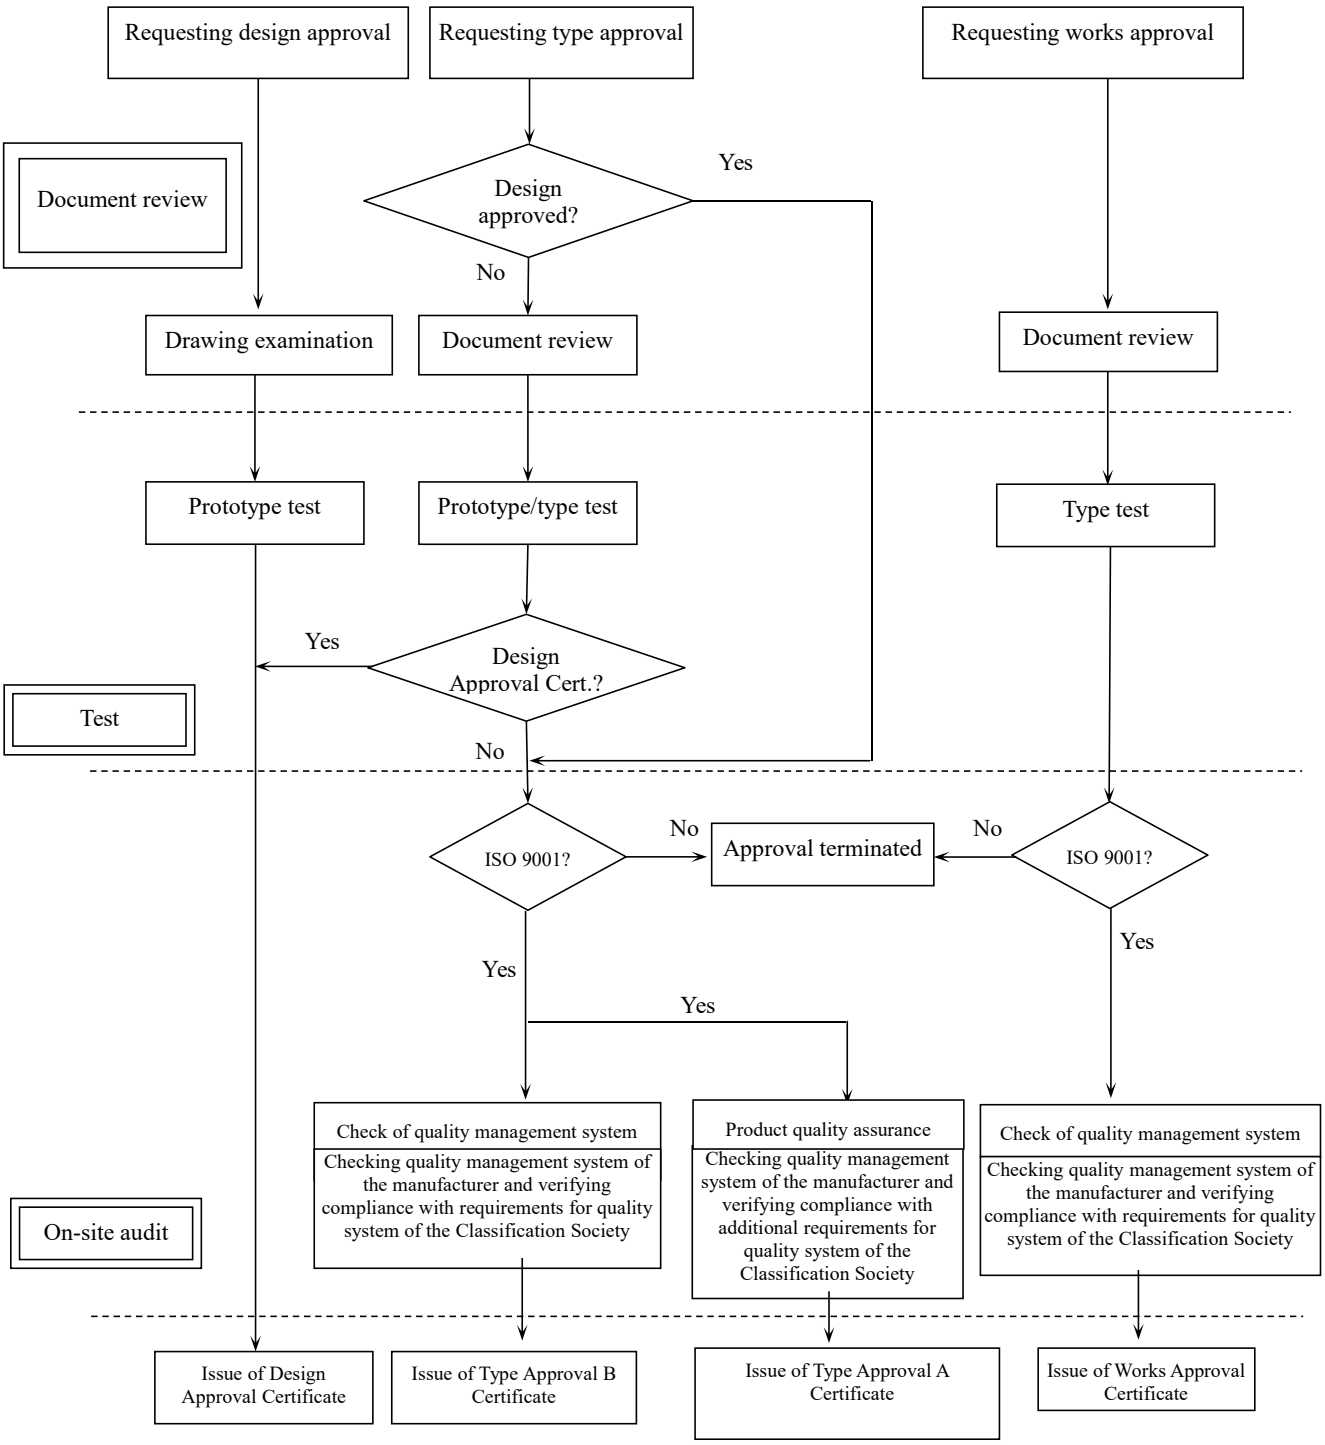

Figure 3.1.4.2

3.1.4.3 The products' manufacturing characteristics and representativeness of inspection samples are basis for distinguishing type approval and works approval. Applicable approval modes are shown in Appendix of this Chapter.

3.1.4.4 In addition to the products to be approved as specified in CCS rules and/or statutory requirements, the manufacturer may apply for approval of one or more types of products for one or more of the following purposes:

(1) providing products of which the type approval is required by CCS rules;

(2) avoiding repeated drawing examination and prototype/type test for the same products;

(3) replacing the Surveyor by the manufacturer in carrying out a part of or complete on-site inspections;

(4) desiring that his products be entered into CCS Lists of Approved Marine Products.

3.1.4.5 Where the products have been approved in one or more modes, the specified unit/batch inspection requirements may be replaced with the following:

(1) reducing the inspection items requiring attendance by the Surveyor;

(2) replacing the Surveyor by the manufacturer in carrying out a part of or complete on-site inspections; verifying by the Surveyor of production and quality control information provided by the manufacturer.

3.1.4.6 The manufacturer is to make preparations for inspection and provide sufficient and safe conditions for inspection so as to ensure that the Surveyor is capable of:

(1) having access to products for carrying out the specified inspection;

(2) witnessing specified tests of products on site;

(3) obtaining documents, records and information necessary for the inspection, including information of suppliers of raw materials, components and parts.

3.1.4.7 Where required by CCS rules and guidelines, the raw materials, components and parts used for products are also to be certified accordingly and/or their manufacturers are to be approved by CCS.

3.1.4.8 The products, for which type approval or works approval is granted, are to be produced at the manufacturer's production facilities stated in the approval certificate, and CCS does not accept any inspection of those approved products which are subcontracted.

3.1.4.9 With approval by CCS, relevant parties carrying out production by OEM or ODM may apply for approval by CCS, sign written agreement relating to product design, manufacture and quality control and submit it to CCS.

3.1.4.10 Where any harmful defect or damage is caused by raw materials or main components and parts to approved products, the manufacturer is to promptly inform CCS of this and take one or more of the following measures:

(1) suspension of the manufacturing of such products, investigation and analysis of the quality and the safety effects of such products installed onboard;

(2) termination of their use for approved products;

(3) re-evaluation of supplier(s);

(4) disqualification of supplier(s).

Where the measure stated in (1) above is considered necessary by CCS, the approval will be suspended.

3.1.4.11 The nameplate, usage identification, usage/operation instructions and quality certificate (including standards used as basis, product performance, quality assurance, liability, etc.) of the products inspected by CCS are to be in a language specified by the ordering party, with at least an English translation for ships engaged on international voyages.

3.1.5 Documents

3.1.5.1 Approval certificates

(1) An appropriate approval of the product by CCS is to be certified as follows:

① Design Approval Certificate (DAC) issued by CCS, showing compliance of the design with CCS rules;

② Type Approval Certificate (TA-BC and TA-AC) issued by CCS, showing that the design complies with CCS rules and that the manufacturer has the ability to continuously produce in batches the products in compliance with rules and/or recognized standards;

③ Works Approval Certificate (WAC) issued by CCS, showing that the manufacturer has the ability to produce the products required by CCS rules;

④ Class Notation Approval Certificate (AAC) issued by CCS, showing that the products meet additional requirements of CCS rules/guidelines.

(2) The Design Approval Certificate, Type Approval Certificate, Works Approval Certificate and Marine Products Certificate are documents of compliance for products at different stage aiming at different requirements, and they cannot replace each other.

3.1.5.2 Products documents

(1) A unit/batch inspection of classed or statutory products is to be documented as follows:

① Marine Products Certificate:

A document issued by the Surveyor to show that:

a. the product complies with rules;

b. required inspection and test have been carried out;

c. the sample is taken from the product to be inspected;

d. the product has been tested in the presence of the Surveyor, or a recognized independent third-party service firm of inspection and testing accepted by CCS, or in a specially agreed

condition.

② Equivalent document[①]:

A document issued by the manufacturer, stamped by CCS and endorsed by the Surveyor to show that:

a. the product complies with rules;
b. required inspection and test have been carried out;
c. the sample is taken from the product to be inspected;
d. the product has been tested in the presence of the Surveyor, or a recognized independent third-party service firm of inspection and testing accepted by CCS, or in a specially agreed condition.

(2) The classed and statutory products of which the type approval and/or works approval is required but the products certificate is not required, are to provide type approval and/or works approval certificates and may be certified as follows:

① Manufacturer's document (W) is issued by the manufacturer to show that:

a. the product is type approved or works approved by CCS;
b. the product complies with rules;
c. required inspection and test have been carried out;
d. the sample is taken from the product to be inspected;
e. the product has been tested and endorsed in the presence of the department's representative authorized by the manufacturer.

(3) An inspection of products other than those specified in rules or statutory requirements is to be documented as follows:

① Inspection certificate of marine products:

A document issued by the Surveyor to show that:

a. the product standards as determined by the applicant have been complied with;
b. the inspection and test has been witnessed by the Surveyor and/or the test report has been reviewed by him;
c. the test sample is taken from the product to be inspected.

② Test certificate of marine products:

A document issued by the Surveyor to show that:

a. the product has been tested in the presence of the Surveyor;
b. the test sample is taken from the product to be inspected.

3.1.5.3 The requirements for certificates of classed and statutory products and lifting appliances are given respectively in Appendices of this Chapter. These appendices are to be used in accordance with 4.2.1.2 of Chapter 4. Products with approval and/or inspection requirements by appendices of this Chapter are not to be issued with inspection certificate and inspection certificate.

3.1.5.4 If deemed necessary, the Surveyor may require to attend the test of the products which may hold a manufacturer's document (W), or examine the control of their manufacturing quality.

3.1.6 Conditions for use of inspection marks

3.1.6.1 The marine products inspected by CCS are to be stamped with an inspection mark on the body of the products and/or at their nameplates. According to the way in which an inspection is carried out, one of the following inspection marks is to be stamped:

Mark A

Mark B

(1) Mark A indicates that the product has been satisfactorily inspected and tested in the presence of the Surveyor;

(2) Mark B indicates that the product has been inspected by the manufacturer according to CCS

---

① The contents of an equivalent document are to comply with the following requirements:

a) the units of measurement are to be consistent with those in rules or international units (i.e. SI units) are to be used;
b) symbols used for properties and characteristics (e.g. tensile strength and impact property of materials) of products are to be consistent with those in CCS rules and if any other symbol is adopted, a definition is to be given;
c) the basis for inspection is to be identified;
d) the identification of products (e.g. cast/batch no.) and that of inspection are to be identified;
e) a manufacturer's statement is to be contained to the effect that "testing has been satisfactorily completed in accordance with CCS rules, or technical specifications for acceptance or relevant standards approved or accepted by CCS".

requirements not in the presence of the Surveyor and that the inspection results have been confirmed by CCS as satisfactory; or that the product has been inspected and tested in the presence of the Surveyor, but such marks are affixed by the authorized manufacturer to satisfactorily inspected products.

3.1.6.2 Mark A is only for use by the Surveyor. The use of mark B is delegated to inspection personnel of the manufacturer according to an approved inspection scheme.

3.1.6.3 The inspection marks are to be affixed by a steel stamp so far as is practicable, generally on a readily accessible non-working face and/or nameplate of the product. If this is impracticable, fake-proof CCS inspection poster or other marking means agreed by CCS may be used. The distribution of the steel stamps or other marks is to be controlled.

3.1.6.4 The style and size of an inspection mark to be used by the manufacturer as delegated by CCS are to be confirmed by CCS for information prior to use.

3.1.6.5 The style of the inspection mark stamped on products is to be reflected conformably on the Marine Products Certificate or equivalent document.

3.1.6.6 Where any product, which has been stamped with an inspection mark, is found unsatisfactory in the subsequent inspection, measures are to be taken to remove the mark.

3.1.7 Conditions for use of approved product logos

3.1.7.1 When a product is eligible for approval in accordance with the relevant requirements of this Chapter, the manufacturer may use CCS logo as an approved product logo, provided that following requirements are complied with:

(1) The logo may only be used on advertising and promotional material and must not be used except in connection with those products or services described in the approval certificate.

(2) Where the logo is used directly on or closely linked to products, it does not imply that such products themselves are found satisfactory by CCS in any unit/batch inspection.

(3) If used with other logos, any misunderstanding must be avoided. CCS may ask that the manufacturer discontinue any use of other logos that are unacceptable to CCS.

(4) Upon the invalidation of CCS approval certificate, the manufacturer must immediately discontinue all use of the logo and to dispose all stocks of material on which the logo appears.

(5) The logo may be scaled uniformly to any size necessary. The manufacturer is not to make any unauthorized change to the letters or graphics of the logo or their combination.

(6) Without authorization by CCS, the manufacturer is not to allow any third party to use the logo in whatever form and for whatever reason.

(7) If CCS has clear evidence for believing that the manufacturer is in contravention of the provisions for using the logo, it will cancel the approval certificate and terminate the approval of other products of the manufacturer.

(8) CCS shall not be responsible and liable for any economic and legal consequences arising from the use by the manufacturer of the logo.

3.1.7.2 The approved product logos① are shown below:

3.1.8 Invalidation, suspension, cancellation and reinstatement of approval certificate

3.1.8.1 The approval certificate will be automatically invalid in one of the following conditions:

(1) any unauthorized alteration has been made to the certificate by its holder;

(2) any convention, law, rule or standard applicable to the existing approved products has been abolished;

(3) any major change has been made to the design (see 3.1.2.1(17)) or documentation (see 3.1.2.1(18)) of products without approval by CCS;

(4) any change has been made to the mode of production without approval by CCS; or

(5) a periodical audit by CCS has not been accepted as required.

3.1.8.2 CCS will suspend the certificate within the period of its validity when CCS identifies that one of the following conditions exists at the manufacturer:

(1) a periodical audit by CCS has not been accepted as required;

(2) any serious nonconformity of the approved products is found during a periodical audit;

---

① Where the use of any logo is permitted by CCS, a sample of such logo will be provided to the manufacturer.

(3) any nonconformity found during a periodical audit has not been rectified as required;
(4) any major change has been made to the quality management system of the manufacturer without notification to CCS;
(5) quality problems of products are caused by ineffective operation of the quality management system of the manufacturer;
(6) any change affecting product performance and safety has been made to approved major raw materials and/or components and parts without approval by CCS;
(7) no remedial action has been promptly taken against quality problems of products or no assistance given to investigation by CCS;
(8) the approved product logos of CCS are not used according to relevant provisions;
(9) relevant fees have not been paid on time;
(10) any other condition identified by CCS for which suspension of the certificate is necessary.

3.1.8.3 CCS will cancel the certificate within the period of its validity when CCS identifies that one of the following conditions exists at the manufacturer:
(1) the condition leading to suspension of the certificate has not been rectified within the specified period, or suspension of the certificate has continued for 6 months;
(2) the products installed or used on board a ship classed with CCS have been produced at the facilities not stated in the certificate (including the approved products being subcontracted or the approved products being produced by another manufacturer under the same brand) without approval by CCS;
(3) the approval certificate and/or the marine products certificate is used not according to CCS requirements, and the ordering party has been intentionally misled to install or use products, which have actually not been inspected by CCS as required, on board a ship classed with CCS;
(4) CCS inspection marks are not used according to CCS requirements;
(5) any CCS marine products certificate or inspection mark has been counterfeited;
(6) there was any fraud, falsification, deliberate concealment of facts or any other illegal conduct on the part of the manufacturer in the process of design, manufacture or survey of marine products;
(7) any serious nonconformity of the approved products is found during a periodical audit and has not been corrected within specified period;
(8) any other condition identified by CCS for which cancellation of the certificate is necessary.

3.1.8.4 Reinstatement of approval certificate
(1) Reinstatement of approval certificate is not allowed after it is invalidated or canceled.
(2) If the approval certificate is suspended, the customer may apply for reinstatement of the certificate if the conditions for reinstatement are satisfied. If the certificate is still within its validity period and it is confirmed by CCS that the reinstatement conditions are satisfied by the customer, the approval qualification can be reinstated, and the certificate will remain valid with its validity period subject to confirmation by CCS. If the customer fails to satisfy the reinstatement conditions within 3 months, the certificate will become invalid, and the customer is to go through formalities for cancellation of approval certificate. If the approval certificate expires during the suspension period, the certificate will automatically become invalid.

3.1.9 Cancellation of marine product certificate/equivalent document

3.1.9.1 Marine product certificate/equivalent document will be automatically cancelled in one of the following conditions:
(1) any unauthorized alteration has been made to the certificate by its holder;
(2) CCS is not informed in a timely manner as required or no remedial action has been taken to quality problems of products or no assistance given to investigation by CCS;
(3) any fraud, falsification, intentional concealing of facts or any other illegal conduct on the part of the manufacturer in obtaining certificate;
(4) relevant fees have not been paid on time;
(5) any other condition identified by CCS for which cancellation of the certificate is necessary;
(6) after the product is furnished with a certificate, any change which is inconsistent with the product design and documents approved by CCS has been made to the product, or the product has been adjusted in accordance with procedures not approved by CCS.

3.1.10 Intellectual property rights and confidential principles

3.1.10.1 The applicant shall promise legal possession of submitted drawings and documents and be responsible for the truthfulness and completeness of application and submitted drawings and documents. CCS will not be liable for any loss, damage or legal responsibilities arising from truthfulness and completeness of submitted documents and property of drawings and documents.

3.1.10.2 CCS is responsible for keeping confidentiality of drawings and technical documents submitted by the applicant. Except for legal litigation, without written authorization of the applicant, disclosure shall not be made to any other person or entity irrelevant to product design, manufacturer and maintenance. The application conditions of information disclosure are shown in 2.12.2 of this PART.

Section 2 UNIT/BATCH INSPECTIONS

3.2.1 Application

3.2.1.1 Unless otherwise provided, the unit/batch inspection procedure of this Section applies to the products with CCS marine product certificate/equivalent document.

3.2.1.2 Appendix 1A of this Chapter is the List of Certification Requirements for Classed Marine Products, as required for the ships classed with CCS.

3.2.1.3 Appendix 1B of this Chapter is the List of Certification Requirements for Statutory Marine Products, as required for the statutory services delegated to CCS.

3.2.1.4 Appendix 1C of this Chapter is the List of Certification Requirements for Lifting Appliances, as required for the issue of certificates relevant to lifting appliances by CCS.

3.2.1.5 Appendix 1D of this Chapter is the List of Certification Requirements for Liquefied Natural Gas Specialized Products, as required for the issue of certificates relevant to liquefied natural gas carriers and ships powered by natural gas as fuel by CCS.

3.2.1.6 Appendix 1E of this Chapter is the List of Certification Requirements for Methanol Fuel System Specialized Products, as required for the issue of certificates relevant to ships powered by methanol as fuel by CCS.

3.2.1.7 Appendix 1F of this Chapter is the List of Certification Requirements for Ammonia Transport and Ammonia Fuel Specialized Products, as required for the issue of certificates related to liquid ammonia carriers and ships powered by ammonia as fuel by CCS.

3.2.1.8 Appendices 2A, 2B and 2C of this Chapter are list of certification requirements for material and components of products of Appendices 1A, 1B and 1C respectively. Except for diesel engines, boilers, pressure vessels and lifting appliances, certification requirements for raw material of general machinery and electrical installations are not shown in Appendices 2A, 2B and 2C.

3.2.2 General requirements

3.2.2.1 Unless specially considered by CCS, the statutory products, classed materials, and essential machinery and electrical equipment as specified in Appendices of this Chapter are to be subject to unit/batch inspection after approval of such products (specific products are given in Appendices of this Chapter). For the products of which the approval is not required in Appendices of this Chapter, CCS will make an appropriate assessment of the production capability and conditions of the manufacturer, when receiving his initial application for unit/batch inspection, to determine whether or not to accept the application.

3.2.2.2 In general, the procedure of unit/batch inspection consists of the following process (see Figure 3.2.2.2):

(1) examination of drawings and technical documents (hereinafter referred to as “drawing approval”), or prototype/type test or measurement, for confirming compliance with CCS rules or other recognized standards;

(2) inspection and test during manufacturing and/or of final products for confirming compliance with CCS rules and/or approved design drawings;

(3) the Marine Products Certificate or an equivalent document is issued to the products complying with relevant requirements.

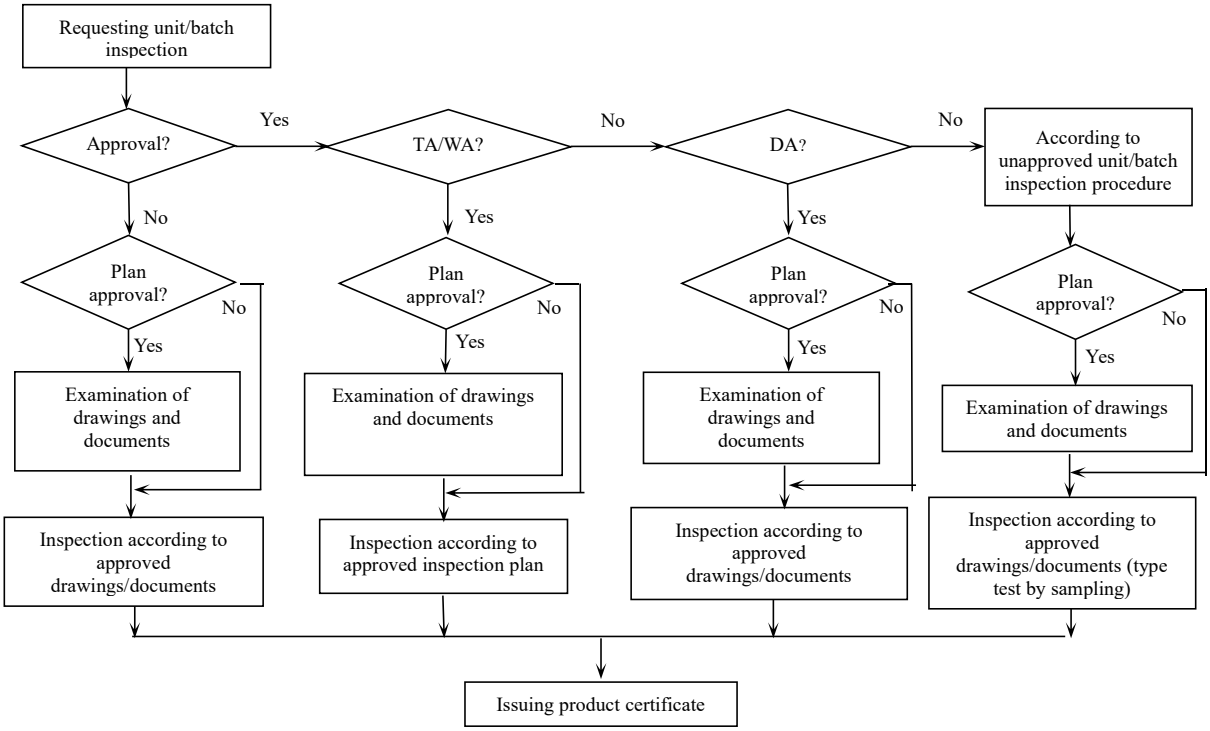

Figure 3.2.2.2

3.2.2.3 For one or more products which have been approved by CCS, the unit/batch inspection attended by the Surveyor may be dealt with according to the approved inspection scheme , and the preparation of product inspection scheme is to comply with following principles:
(1) no repeated type test is needed after design approval, and the Surveyor is to carry out site inspection unit by unit;
(2) no repeated type test is needed after type approval B, test items witnessed by the Surveyor and/or witnessed sampling proportion may be reduced according to the result of on-site audit to the manufacturer;
(3) no repeated type test is needed after type approval A, inspection witnessed by the attending Surveyor may be replaced in full according to the result of on-site audit to the manufacturer, and unit/batch inspection may issue certificate for auditing works documents;
(4) no repeated type test is needed after works approval, test items and/or frequency witnessed by the Surveyor may be reduced according to the result of on-site audit to the manufacturer.
3.2.2.4 For products requiring unit/batch inspection after approval in Appendices of this Chapter, if the applicant has no will for approval, application for unit/batch inspection may be accepted with approval by CCS, requiring that products are to carry out plan approval and inspection according to the requirements of 3.2.2.2.
3.2.2.5 Unit/batch inspections to products which are unnecessary to be approved are to be carried out unit by unit or batch by batch according to drawings and technical documents approved by CCS.
3.2.2.6 Where type approval or equivalent information is available for the products to be inspected, CCS will assess the relevant information provided by the applicant to determine whether a partial or full type test is needed.

3.2.3 Drawing approval

3.2.3.1 For each application for unit/batch inspection, the applicant is to prepare design drawings and/or technical documents and submit them to CCS for examination. For details, see Section 6.

3.2.4 Type test

3.2.4.1 The products, of which type test is required by relevant chapters of CCS rules and/or Appendices of this Chapter, are subject to type test when unit/batch inspection of such products is requested.
3.2.4.2 The type test is to be carried out according to a test programme approved by CCS.
3.2.4.3 The type test sample is to be manufactured according to approved drawings and/or production technology and be the prototype or a product of the same specification and manufacture taken at random from the production line. In the latter case, the sample is to be taken and specifically identified and if

necessary, sealed up in the presence of the Surveyor.
Where preparation of samples is necessary, they are to be prepared, identified and their marks transferred in the presence of the Surveyor. The way of sampling are taken, the technology of preparation and the number of samples are to comply with CCS rules. Prior to the test, the Surveyor is to check the compliance of samples and verify the identification of the samples.
3.2.4.4 The items related to product performance, environment, etc., as specified in CCS rules, the standards applied by or the technical requirements of the manufacturer, are in general to be tested in the presence of the Surveyor.
Type tests are to be arranged in priority in laboratory approved by CCS according to 3.7.5.2 of this Chapter. Where the manufacturer arranges required tests at a laboratory approved by China National Accreditation Board for Laboratories or another foreign laboratory acceptable to CCS, if the laboratory is found by CCS, upon an assessment, to comply with the requirements for testing of marine products, consideration may be given to accepting the results of such tests and if necessary, CCS may require a retest.
3.2.4.5 Some or all of type test items may be tested under test conditions provided by the manufacturer. However, the appropriate test ability under such test conditions are to be confirmed CCS.
3.2.4.6 After completion of the type test, the test organization is to prepare a test report, covering at least the following:
(1) type, specification and identification of the product;
(2) test basis: test method and acceptance condition;
(3) environmental conditions of each test item, if applicable;
(4) date and place of test;
(5) test results.
3.2.4.7 The test report is to be signed by person(s) in charge from the test organization and the Surveyor. Where the Surveyor is not present at the test, he is to confirm the test report.

3.2.5 Material test

3.2.5.1 Materials are to be tested according to CCS rules. In general, the Surveyor is to confirm the document of material test and where required by CCS rules, the Surveyor is to be present at the test.
3.2.5.2 The test and measurement equipment is to be properly calibrated and maintained in a good condition. The calibration records are to be kept and made available to the Surveyor when he needs them.
3.2.5.3 The chemical composition of materials is to be determined and this composition is to be proved by the material supplier through the specified ladle analysis. The laboratory undertaking the analysis is to be provided with adequate test equipment and instrumentation, and the analysis is to be performed by qualified personnel.
3.2.5.4 The chemical analysis by the manufacturer is in general acceptable. However, the Surveyor may require a random check.

3.2.6 Inspections

3.2.6.1 During manufacturing, the manufacturer is to assist the Surveyor in getting access to all locations related to the inspection for confirming:
(1) effective implementation of the production technology;
(2) compliance of manufacturing with the approved drawings and technical requirements;
(3) correct application of materials and welding consumables;
(4) correct sampling and testing.
3.2.6.2 The final inspection and test of the products are to be carried out in the presence of CCS Surveyor and according to the approved design documents actually used and the applicable requirements specified in CCS rules. CCS is responsible only for those inspection and test items requiring attendance by its Surveyors.

3.2.7 Issue of marine product certificate /equivalent document

3.2.7.1 The certification requirements for various products (including components and raw material) are given in Appendices of this Chapter, except as required by the applicant otherwise. An appropriate marine product certificate/equivalent document is to be issued after completion of the unit/batch inspection.
3.2.7.2 Unless otherwise specified, a separate marine product certificate/equivalent document may not be required for the marine products manufactured by the shipyard and covered by the ship survey according to product inspection requirements.
3.2.7.3 For components with type approval requirements in Appendices 2A, 2B and 2C which are manufactured by the manufacturer and only for the products of the manufacturer, if the components are covered by product approval, a separate approval certificate is not to be issued.

3.2.7.4 For components with product certificate requirements in Appendices 2A, 2B and 2C which are manufactured by the manufacturer and only for the products of the manufacturer, inspection is to be carried out according to CCS requirements, and a separate product certificate may not be issued.

Section 3 DESIGN APPROVAL

3.3.1 General requirements

3.3.1.1 The design approval applies in general to the approval of design of marine products in the category of equipment and systems. Specific products to which such approval is applicable are listed in Appendices of this Chapter. For products listed in the Appendices and not applicable to design approval, if they are used for design transfer, CCS may accept applicant's application for design approval. But for use in real ship, the products are to obtain relevant approval certificates according to certification requirements in Appendices of this Chapter.

3.3.1.2 The applicant for design approval is to submit to CCS Application for Design Approval of Products and clearly state the purpose, type, model and main characteristic parameters of the products together with the latest versions of all standards used.

3.3.1.3 The design approval consists of drawing examination and prototype test.

3.3.2 Drawing examination

3.3.2.1 Design approval applicants are to prepare product design drawings and/or technical documents according to relevant requirements of Chapters and PARTS of the rules for CCS examination or for information. For details, see Section 6 of this Chapter.

3.3.3 Prototype test and/or inspection

3.3.3.1 The prototype product, for which design approval is sought, is to be inspected and identified by the Surveyor to confirm that it is manufactured according to approved drawings and that it complies with CCS rules and guidelines, applicable standards or the manufacturer's technical requirements and is fit for its intended purpose on board.

3.3.3.2 If applicable and considered as a necessary process for design approval, the prototype test is to be conducted by the manufacturer in the presence of the Surveyor. The prototype test is to cover product performance tests, environmental tests or other tests, as specified in CCS rules and guidelines, applicable standards or the manufacturer's technical requirements, and the test programme is to be submitted to CCS for approval.

3.3.3.3 The requirements for the prototype test report are to be in accordance with 3.2.4 of this Chapter.

3.3.3.4 If the required tests have been completed or are underway at an independent testing organization accepted by CCS, special consideration will be given to the acceptability of any test results obtained not in the presence of CCS Surveyor. For details, see also 3.2.4.4.

3.3.4 Issue and validity of Design Approval Certificate

3.3.4.1 Where the products have been assessed according to 3.3.2 and 3.3.3 of this Section and found to comply with CCS rules, guidelines and/or applicable standards and/or the manufacturer's technical requirements, a Design Approval Certificate valid for not more than 5 years will be issued by CCS.

3.3.4.2 The renewal of the approval certificate is to be completed within 3 months before the expiry date of the existing certificate, and the new approval certificate is to be valid to a date not exceeding five years from the date of expiry of the existing certificate.

3.3.4.3 The products, of which the design has been approved, and their designer will be entered into CCS Lists of Approved Marine Products.

3.3.5 Renewal audit

3.3.5.1 The renewal audit for the Design Approval Certificate is to be carried out within 3 months before the expiry date of the certificate. The manufacturer is to send a written application to CCS and inform CCS of any change to the product design. CCS is to:

(1) verify the drawings to check any change to the design or specifications of the products to the applicable rules or standards;

(2) re-approve the test programme in case of any change.

3.3.5.2 Where there is no change to the design, the prototype/type test may in general be dispensed with and if necessary, CCS may require a random inspection of all/partial items for retest.

3.3.5.3 Where the applicant is found to remain in compliance with the conditions for design approval

upon check, a new Design Approval Certificate will be issued by CCS.

3.3.6 Change of approved products

3.3.6.1 For products subject to CCS design approval, the original applicant of design approval is to inform CCS of any change to design or applicable standards and receive CCS assessment thereof. CCS is to determine whether a new design approval is needed according to character and degree of design change.

Section 4 TYPE APPROVAL

3.4.1 General requirements

3.4.1.1 This Section specifies general principles and procedures for CCS type approval of products in confirming the manufacturer's ability to produce consistent products in compliance with CCS rules.

3.4.1.2 Upon application by the manufacturer, the products not required by CCS rules may be approved according to the standards/technical requirements agreed between CCS and the manufacturer.

3.4.1.3 The manufacturer is to have a quality management system certificate based upon ISO 9001 or the equivalent standards and issued by an accredited certification body, the certificate is to be kept valid.

3.4.1.4 The manufacturer is to have a quality control system, drawings, rules and standards that cover the product to be certified.

3.4.1.5 The manufacturer applying for type approval of mode A is to have the quality management system or the additional alternative quality control plan which covers all required inspection, testing and certification in compliance with CCS rules. Where associated sub-suppliers or sub-contractors are needed, the quality management system of the sub-supplier or sub-contractor is to be included in the control requirements of the manufacturer, or the sub-supplier or sub-contractor applies separately for type approval of mode A.

3.4.1.6 For manufacturers applying for type approval of mode A, the required inspection and testing are permitted in two versions with regard to traceability:

(1) The manufacture describes the relevant inspection, testing and certification additional to the manufacturer's standard quality control in order to meet the Rules. The components are to be stamped with a special stamp supplied by CCS or identified as required by CCS.

(2) The manufacturer has a standard quality control system which covers all required inspection, testing and certification in compliance with the Rules. The traceability and the required type of product document for components or products are defined in the system.

3.4.1.7 For manufacturers applying for type approval of mode B for Alternative Certification Scheme, the relevant requirements of Section 10 of this Chapter are to be complied with.

3.4.2 Process of type approval

3.4.2.1 The type approval of products consists of following processes:

(1) Document examination, including:

① drawing examination;

② document examination.

(2) prototype/type test;

(3) on-site audit, including:

① check of quality management system;

② audit of the manufacturing process.

3.4.2.2 The applicant for type approval is to submit an application to CCS, stating the requested type approval and providing information on the manufacturer and his production location as well as all other information necessary for the products to be approved.

3.4.2.3 While the process of type approval covers design approval (see Section 3 of this Chapter), a separate application for design approval need not be made in respect to the products for which type approval is sought, unless the manufacturer requests both type approval and issue of the Design Approval Certificate.

3.4.2.4 If the applicant is not the patent party having design approval, it is to identify in writing that authorization from patent party has been obtained with legal source.

3.4.3 Document examination

3.4.3.1 The drawing examination is to be in accordance with Section 6 of this Chapter.

3.4.3.2 The document examination is to be in accordance with 3.5.2, Section 5 of this Chapter.

3.4.3.3 In addition, for manufacturers applying for type approval of mode A, the following documents are to be submitted for examination:
(1) the extent of the required inspection and testing under which conditions the manufacturer may perform all or parts of the required inspection and testing without the presence of a Surveyor, including that of the sub-contracted components;
(2) the additional alternative quality control plan which covers all required inspection, testing and certification in compliance with the Rules, including the procedure of the components to be stamped with a special stamp supplied by CCS or identified as required by CCS;
(3) the standard quality control system which covers all required inspection, testing and certification in compliance with the Rules, including the procedure of the traceability and the required type of product document for components or products;
(4) the existing class approvals of the manufacturer's products as far as required;
(5) quality control plans relevant to the products and relevant components. Such plans are to detail the inspections and tests required by the Rules with an indication that the inspections and tests have been delegated to the manufacturer;
(6) list of nominated personnel for:
① marking/stamping of products;
② tests and inspection (responsible);
③ provision of data and information (e.g. declaration of conformity, test reports etc.);
(7) any other additional documents that CCS may require in order to evaluate the manufacturing processes and the product quality control.

3.4.4 Type test
3.4.4.1 The type test is to be in accordance with 3.2.4, Section 2 of this Chapter.
3.4.4.2 Where the products, for which type approval is requested, have been design approved by CCS,
(1) if samples for prototype test of design approval is manufactured by the applicant, the confirmation of the Design Approval Certificate will suffice, and the requirements of above 3.4.3.1 and 3.4.4.1 need not be followed. However, a final inspection of product samples is to be performed with attendance by CCS Surveyor;
(2) if samples for prototype test of design approval is not manufactured by the applicant, considering the difference of raw material, production equipment and production technology, the applicant is to carry out a new type test unless otherwise agreed by CCS.

3.4.5 On-Site audit
3.4.5.1 Check of quality management system in production location of the manufacturer by the Surveyor is to meet the requirements of Section 9 of this Chapter.
(1) For manufacturers applying for type approval of mode B, check of quality management system is to meet the requirements of 3.9.2.1, Section 9 of this Chapter.
(2) For manufacturers applying for type approval of mode A, check of quality management system is to meet the requirements of 3.9.2.1 and 3.9.2.2, Section 9 of this Chapter.
3.4.5.2 Audit of the manufacturing process
(1) The Surveyor is to carry out audit in such locations as relevant departments, workshops, storage locations and laboratories according to the scope of application for approval, so as to confirm that production equipment, manufacturing technology and test ability meet relevant requirements of CCS.
(2) Representative pieces of the products within the approval scope are to be provided by the manufacturer to the Surveyor for verifying that they are manufactured according to the design documents. The Surveyor is to audit manufacturer's production and inspection records consistency of approved drawings/technology documents.
(3) A quality control plan for the products within the approval scope is to be established by the manufacturer applying for type approval of mode A and submitted to CCS for approval. This quality control plan is to describe the quality assurance and control methods used in the manufacturing process according to the technical requirements or standards of the products, reflecting in particular the inspection and test requirements of CCS rules, guidelines and/or conventions.
3.4.5.3 For purchased materials and components, CCS may, depending on their importance level, require:
(1) an inspection at workshops of the suppliers;
(2) appropriate tests.
3.4.5.4 Any nonconformity found during the audit is to be notified to the manufacturer for remedial actions. Any remedial action for any nonconformity is to be followed up for verification.

3.4.6 Issue and validity of Type Approval Certificate

3.4.6.1 CCS will issue a Type Approval B Certificate valid for not more than 5 years to a manufacturer for whom the drawing examination, type test and on-site audit have been completed according to 3.4.3, 3.4.4 and 3.4.5 respectively and who is found to meet following conditions:

(1) the product design complies with conventions, applicable requirements of CCS rules and/or other applicable standards;

(2) an effective specialized quality management system for marine products is in place for ensuring the quality control level required by the manufacturer.

3.4.6.2 The renewal of the approval certificate is to be completed within 3 months before the expiry date of the existing certificate, and the new approval certificate is to be valid to a date not exceeding five years from the date of expiry of the existing certificate.

3.4.6.3 CCS will issue the Type Approval A Certificate for a period not exceeding 5 years to a manufacturer at his request for whom the drawing examination, type test and on-site audit have been completed according to 3.4.3, 3.4.4 and 3.4.5 respectively and who is found to comply with the following requirements:

(1) the requirements for type approval B are met, product quality assurance meeting requirements of ISO 9001, having an additional CCS-approved procedure for ensuring that inspections and tests will be in accordance with CCS rules and guidelines;

(2) product quality is found upon CCS inspection experience and quality system check to be continually kept stable during the period of holding the Type Approval B Certificate;

(3) the operation of the quality management system for marine product is capable of achieving at least the results of the inspections and tests attended by CCS Surveyor.

3.4.6.4 The products having a Type Approval Certificate and their manufacturers will be entered into CCS Lists of Approved Marine Products.

3.4.7 Periodical audit

3.4.7.1 Within the period of validity of the approval certificate, a manufacturer complying with the following three conditions is to apply for a periodical verification annually to ensure maintenance of the validity of the certificate. The periodical verification is to be carried out within 3 months before or after the anniversary date of the certificate which corresponds to the expiry date:

(1) the product has type approval mode A certificate;

(2) the product has type approval mode B certificate, and marine product certificate/equivalent document is not necessary;

(3) the product has type approval mode B certificate, and the use of the Alternative Certification Scheme as specified in Section 10 of this Chapter is applied for.

3.4.7.2 The periodical audit includes:

(1) check of quality management system is to meet the requirements of 3.9.2.3, Section 9 of this Chapter;

(2) if deemed necessary by CCS, random inspection/test for the approved products may be carried out. The samples for inspections/ tests are to be selected in the presence of the Surveyor, with the type and number of samples being determined by the Surveyor depending on the complexity, production scale and type of the products;

(3) for manufacturers using the Alternative Certification Scheme specified in Section 10 of this Chapter, the process of their product manufacturing, inspection and testing is to be audited to verify it is properly controlled, and the consistency and validity of the approved quality control plan.

3.4.7.3 Where the manufacturer is found to comply with the conditions for maintaining the certificate at the periodical audit, a periodical audit certificate will be issued by CCS.

3.4.8 Renewal audit

3.4.8.1 The renewal audit for the Type Approval Certificate is to be carried out within 3 months before the expiry date of the certificate. The manufacture is to send a written application to CCS and inform CCS of any change to the product design and quality system. CCS is to:

(1) confirm the drawings to check any change to the rules or standards applicable to the design or specifications of the products;

(2) re-approve the type test programme in case of any change;

(3) carry out on-site audit according to 3.4.5;

(4) for manufacturers using the Alternative Certification Scheme specified in Section 10 of this Chapter, audit and verify that the process of their product manufacturing, inspection and testing is to be properly controlled, complying with the conditions for maintaining the Alternative Certification Scheme, and the consistency and validity of the approved quality control plan.

3.4.8.2 Where there is no change to the technical requirements for product approval and design, part or all of the type approval test items may be dispensed with; if necessary, CCS may require all test items.
3.4.8.3 Where the manufacturer is found to remain in compliance with the conditions for type approval upon check, a new Type Approval Certificate will be issued.

3.4.9 Change of approved products

3.4.9.1 The manufacturer is to supervise any change to the products or their manufacturing process, inform CCS of any major change and receive CCS assessment thereof.
3.4.9.2 Where any change is made to the design of the approved products and their components and parts, materials used or manufacturing method and this affects the main characteristics and features of the products or leads to any change of any performance criterion of the products, a new type approval is to be carried out.

3.4.10 Additional audit

3.4.10.1 Additional audits may be required to the manufacturer and/or sub-supplier, sub-contractor at the discretion of CCS.

Section 5 WORKS APPROVAL

3.5.1 General requirements

3.5.1.1 The works approval applies to the products of which the quality assurance is achieved by means of batch production in a continuous process or completely based on production technology and process. The products for which the works approval is required by CCS are indicated in Appendix of this Chapter.
3.5.1.2 The procedure of works approval consists of the following three parts:
(1) document review;
(2) type test;
(3) on-site audit, including:
① quality system check;
② audit of the manufacturing process.
3.5.1.3 The manufacture is to have obtained the quality management system certificate issued on the basis of ISO 9001 or equivalent standard and maintained valid.

3.5.2 Document review

3.5.2.1 The applicant is to submit a signed application for works approval, stating the products and production locations covered by the works approval, together with the following documents and information for examination:
(1) technical characteristics of the products, at least including the purpose, type, model and main characteristic parameters of the products together with the latest versions of all standards used;
(2) drawings and relevant technical documents of products and manufacturing technologies, including technological processes;
(3) type test programme;
(4) lists of suppliers of raw materials, main components and parts, with an indication of their class approval (as far as required by the Rules) and the type of material certification in each case;
(5) quality assurance system documents, including quality manual, and the procedures relevant to the quality control and inspections, their methods, frequency and certification, information on main production, inspection and test equipment;
(6) other valid documents, reports and certificates showing the applicant's ability to manufacture the products and control their quality within the scope of approval.
3.5.2.2 CCS examines the documents and information submitted by the applicant, approves drawings and relevant technical documents of products and manufacturing technologies as well as type test programme and returns them to the applicant.

3.5.3 On-site audit

3.5.3.1 An audit of the quality management system at the manufacturer's production locations by the Surveyor is to meet the requirements of Section 9 of this Chapter.
3.5.3.2 Audit of the manufacturing process
(1) The Surveyor is to carry out audit in such locations as relevant departments, workshops, storage locations and laboratories according to the scope of application for approval, so as to confirm that

production equipment, manufacturing technology and test ability meet relevant requirements of CCS.
(2) Representative products within the approval scope are to be provided by the manufacturer to the Surveyor for verifying that they are manufactured according to the design documents. The Surveyor is to follow up and witness the manufacturing process of representative products (i.e. products for type test or test samples), including witnessing sampling and test to process monitoring and quality verification.
3.5.3.3 For purchased materials and components, CCS may, depending on their importance level, require:
(1) an inspection at workshops of the suppliers;
(2) appropriate tests.
3.5.3.4 Any nonconformity found during the audit is to be notified to the manufacturer for remedial actions. Any remedial action for any nonconformity is to be followed up for verification.

3.5.4 Type test
3.5.4.1 A type test is to be carried out according to 3.2.4, Section 2 of this Chapter.

3.5.5 Issue and validity of Works Approval Certificate
3.5.5.1 CCS will issue a Works Approval Certificate valid for not more than 5 years to a manufacturer for whom the drawing examination, type test and on-site audit have been completed according to 3.5.2 to 3.5.4 respectively.
3.5.5.2 The renewal of the approval certificate is to be completed within 3 months before the expiry date of the existing certificate, and the new approval certificate is to be valid to a date not exceeding five years from the date of expiry of the existing certificate.
3.5.5.3 The products having Works Approval Certificate and their manufacturers will be entered into CCS Lists of Approved Marine Products.

3.5.6 Periodical audit
3.5.6.1 Within the period of validity of the approval certificate, a manufacturer having works approval is to apply for a periodical verification annually to ensure maintenance of the validity of the certificate. The periodical verification is to be carried out within 3 months before or after each anniversary date of the works approval certificate.
The periodical audit includes:
(1) quality system check is to meet the requirements of 3.9.2.3, Section 9 of this Chapter;
(2) if deemed necessary by CCS, random inspection/test for the approved products may be carried out. The samples for inspections/ tests are to be selected in the presence of the Surveyor, with the type and number of samples being determined by the Surveyor depending on the complexity, production scale and type of the products;
(3) for manufacturers using the Alternative Certification Scheme specified in Section 10 of this Chapter, the process of their product manufacturing, inspection and testing is to be audited to verify it is properly controlled, and the consistency and validity of the approved quality control plan.
3.5.6.2 Where the manufacturer is found to comply with the conditions for maintaining the Works Approval Certificate upon the periodical verification, a periodical verification certificate will be issued by CCS.

3.5.7 Renewal audit
3.5.7.1 Where renewal of the Works Approval Certificate is necessary at its expiry, the manufacturer is to send a written application to CCS and inform CCS of any change to the product design and the quality management system within 3 months before the expiry date of the certificate.
3.5.7.2 The document review, on-site audit, approval test and issue of the Works Approval Certificate are to be in accordance with 3.5.2, 3.5.3, 3.5.4 and 3.5.5. For manufacturers using the Alternative Certification Scheme specified in Section 10 of this Chapter, the process of their product manufacturing, inspection and testing is to be audited to verify it is properly controlled, complying with the conditions for maintaining the Alternative Certification Scheme, and the consistency and validity of the approved quality control plan.
3.5.7.3 If there is no change to the technical requirements for product approval and product design, part or all of the test items may be exempted; if necessary, CCS may require all test items.
3.5.7.4 Where the manufacturer is found to remain in compliance with the conditions for works approval upon check, a new Works Approval Certificate will be issued.

3.5.8 Changes to approved products
3.5.8.1 The manufacturer is to supervise any change to the products or their manufacturing process, inform CCS of any major change and receive CCS assessment thereof.

3.5.8.2 After the works approval, the manufacturer is to inform CCS of any significant change to product drawings, technical documents, technological specifications or quality management system. In case of any change affecting product design, main manufacturing materials, key technologies or characteristics and features of products, the associated drawings and technical documents which have been previously approved are to be submitted to CCS for re-approval and if necessary, the items involved in the scope of the changes are to be inspected and tested in the presence of the Surveyor.

3.5.9 Additional audit

3.5.9.1 Additional audits may be required to the manufacturer and/or sub-supplier, sub-contractor at the discretion of CCS.

Section 6 PRODUCT DRAWING EXAMINATION

3.6.1 General requirements

3.6.1.1 Product drawing examination means an examination of design drawings and technical documents for ship associated products.

3.6.1.2 This Section is applicable to examination of drawings for classed ship associated products. In addition, at the request of applicant and with the consent of CCS, CCS may carry out examination to design of relevant products based on information provided by the applicant and according to applicable classification or statutory requirements. Examination is only limited to the scope agreed by CCS and applicant, generally not including requirements for ship system.

3.6.1.3 Product drawing examination is carried out for the purpose of:

(1) confirming product design meets applicable CCS rules and relevant statutory requirements; or

(2) agreeing with applicant on products as basis for verification of compliance of manufactured products with examined drawings.

3.6.1.4 Marine products applying for design approval, type approval, works approval and unit/batch inspection are to be subject to product drawing examination according to the requirements of Appendix of this Chapter.

3.6.1.5 Basis for marine product examination includes CCS rules, international conventions and statutory regulations of flag State government applicable to the product as well as product standards accepted by CCS. For the products clearly specified by the rules, at the request of the applicant, appropriate standards may be accepted as alternative requirements. In any case, alternative standards are not to be inferior to requirements specified by the rules. The drawing examination is primarily to confirm compliance of the design of products with applicable rules and guidelines, or their alternative standards as permitted. Where there are no specially required technical standards in CCS rules, the examination may be based on applicable industrial standards, or in the absence of applicable rules or industrial standards, the manufacturer's standards or product technical requirements or engineering calculation and analysis may also be accepted as the basis for examination. The basis for examination of product drawings will be clearly stated in the product Plan Approval Comments.

3.6.1.6 Examination of product design drawings and technical documents by CCS only includes part of examination basis applicable to the product.

3.6.1.7 The applicant is to submit a formal written application for drawing examination together with the complete drawings and documents, which may be submitted in paper or electronic form (PDF). The applicant is, in the case of paper drawings, generally to submit the application form (to be downloaded on website: http://www.ccs.org.cn) and drawings in triplicate to the plan approval units designated by CCS for examination. Where the drawing examination and inspection are carried out by a same unit, only two copies of drawings need to be submitted. Where the applicant requires more than one copy of drawings to be returned, copies of drawings to be submitted are to be increased accordingly. The application and drawings may be submitted, in the case of electronic form, through registration on website: https://www.ccs-service.net.

3.6.2 Drawing examination

3.6.2.1 Unless otherwise specified by CCS rules, international conventions and statutory regulations of flag State government, following drawings and technical documents related to product design are to be submitted for examination:

(1) design drawings, including general arrangement, drawing of essential parts, main parts or materials list;

(2) documents stating specifications;

(3) documents stating performance and purpose;
(4) necessary engineering calculation and analysis reports;
(5) when necessary, other documents required by CCS.

3.6.2.2 Product drawings and technical documents submitted by the applicant are to comply with following requirements:

(1) Drawings and technical documents are to be submitted in Chinese or English, clearly stating product design, construction, material, dimensions as well as function and performance parameters. If necessary, limitations or provisions for use are to be included.

3.6.2.3 When examination of drawings and technical documents is completed and designed is deemed to comply with the requirements of examination basis, CCS will issue the Plan Approval Comments to applicant.

3.6.2.4 Unless otherwise provided by CCS rules, approval generally means that drawings or documents have been examined and satisfy applicable examination basis requirements. Other drawings or technical documents include but not limited to relevant information for support or assisting examination, which will be kept by CCS for information. Approved conditions and limitation comments may be written on the drawings or stated in the Plan Approval Comments. State of "approval" or "for information" is to be clearly stated in the Plan Approval Comments.

3.6.2.5 One copy of the Plan Approval Comments together with stamped drawings and technical documents is to be kept by the plan approval unit, one copy is to be submitted to the unit carrying out inspection and one copy is to be returned to the applicant. For items applying in the form of electronic document, return is to be in electronic form.

3.6.3 Validity of approval

3.6.3.1 Approved drawings and technical documents are only valid within the scope of manufacturer, construction engineering No. and construction number stated in the Plan Approval Comments.

3.6.3.2 If drawings and technical documents are revised after approval, involving or affecting essential structure, strength, material used, characteristics, features or limitations of main system of product, product and main components, they are to be resubmitted to CCS for approval.

3.6.3.3 Where the entry into force of new rules including their amendments affects product design, main manufacturing materials, key technologies or characteristics and features of products, the approved product drawings and technical documents will be invalid automatically.

3.6.3.4 Where the statutory requirements of the flag State or the international conventions, codes accepted by it and the entry into force of the amendments thereto affect the validity of the approved plans mentioned in 3.6.3.2, the approved statutory plans will be invalid automatically.

Section 7 APPROVAL OF SERVICE FIRM OF INSPECTION AND TESTING

3.7.1 General requirements

3.7.1.1 Approval of service firm of inspection and testing means approval of capability and condition of specific inspection and test items of marine and relevant products carried out by CCS to service firm of testing by such audit methods as document examination, site audit and approval test.

3.7.1.2 This Section is not applicable to approval of service suppliers.

3.7.1.3 Upon CCS audit, if it is confirmed that following provisions are complied with, approval will be given to the firm and a Firm Approval Certificate will be issued:

(1) the firm is to be registered legal entity or organization authorized by legal person, with clear legal status and capability of undertaking legal responsibilities;

(2) complying with relevant provisions of CCS rules, CCS Guidelines on Firm Approval and documents relating to firm approval, and fulfilling relevant liabilities;

(3) complying with provisions of relevant legal regulations.

3.7.1.4 Firm approval procedure is composed of following three parts:

(1) document examination;

(2) on-site audit;

(3) approval test.

3.7.2 Document examination

3.7.2.1 The applicant is to submit a signed application for firm approval, indicating scope of firm

approval, and submit following documents for examination:
(1) firm name, address, brief introduction of service and capability, qualification certificate or system certificate issued by other authorities, history of experience on marine product inspection and testing;
(2) notarial announcement, conduct rules, secrecy promise and other activity information which may present a conflict of interest of marine product manufacturer;
(3) list of inspection and test items and list of inspection standards;
(4) list of main inspection and test instruments, equipment and calibration gauge, including name, type, technical index, manufacturer, inspection period, inspection condition and person in charge of inspection and test instruments, etc.;
(5) post and list of personnel carrying out inspection, calibration and maintenance, training and working experience of relevant personnel within application approval scope and compliance with relevant international, national or industrial approval standards;
(6) organization frame and responsibility;
(7) inspection procedures;
(8) guidelines on operation of inspection and testing equipment;
(9) personnel training procedure;
(10) quality manual or system and procedural documents for implementing effective quality control;
(11) record of customer claims and corrective actions;
(12) formal inspection and test report sample;
(13) firm approval test programme;
(14) other documents as deemed necessary by the Surveyor during approval.
3.7.2.2 CCS carries out examination to documents submitted by the applicant, approves firm approval test programme and returns them to the applicant.

3.7.3 On-site audit

3.7.3.1 Upon document examination and approval of firm approval test programme, the Surveyor carries out on-site audit to technical capability and quality management activities within the scope of application of the applicant according to CCS rules, guidelines and firm approval documents. During on-site audit, all other sites for carrying out one or more key activity and covered by application scope of the applicant are to be audited. On-site audit is to at least include following contents:
(1) checking implementation of management system documents, operational procedure and other documents by inspection firm;
(2) checking and confirming personnel training, experience, educational background, quality and other qualifications of inspection firm;
(3) verifying whether inspection firm facilities and environment are helpful to correct implementation of inspection, test and maintenance;
(4) verifying whether inspection firm uses proper method and procedure to carry out inspection, test and maintenance within approval scope safely and effectively and whether inspection, sampling and storage comply with requirements of relevant provisions;
(5) verifying whether inspection firm is provided with necessary inspection and testing equipment, whether calibration gauge and software comply with required accuracy and requirements of inspection and test rules, and whether periodical calibration and check system are provided;
(6) verifying correctness and traceability of inspection and testing results, inspection and testing quality records and reports of inspection firm as well as whether report preparation, endorsement, audit and issuance comply with relevant provisions;
(7) verifying inspection and testing capability of inspection firm, and verifying correctness, safety and effectiveness of inspection and testing carried out by operator, if necessary, the Surveyor may witness main test items for application.
3.7.3.2 If nonconformities are found during audit, the responsible person of applicant is to be informed to take corrective measures. Corrective measures aiming at nonconformities are to be followed up and verified.

3.7.4 Verification test

3.7.4.1 Verification is to be carried out according to approved firm approval test programme.

3.7.5 Firm approval certificate

3.7.5.1 On completion of document examination, on-site audit and approval test mentioned in 3.7.2 to 3.7.4, CCS will issue a Firm Approval Certificate for service firm of inspection and testing which is valid not more than 5 years.

3.7.5.2 If inspection firm with CCS approval need to provide third party inspection service, the Surveyor may directly accept inspection report, and on-site witness is not necessary.
3.7.5.3 Inspection firm with approval is to collect and summarize relevant testing information required by CCS at regular interval and submit them to CCS.
3.7.5.4 Test data, test reports and other relevant test information are to be submitted to CCS through CCS Product Inspection and Testing Organization Data Acquisition System.
3.7.5.5 The firm with approval certificate for service firm of inspection and testing will be published in CCS website.

3.7.6 Periodical audit

3.7.6.1 Within the period of validity of approval certificate for service firm of inspection and testing, a periodical audit is to be carried out. The scope of periodical audit may be all or partial contents of approval field and approval requirements. The type of periodical audit includes on-site supervision review and information audit, and inspection firm is to provide relevant documents and records (e.g. inspection record, internal quality control result and complaint record). For service firm of inspection and testing in several locations, periodical audit is to cover all locations.
3.7.6.2 Periodical audit is to be completed within 3 months before or after the second anniversary of expiry date of certificate. If service firm of inspection and testing does not submit application for periodical audit to CCS within 3 months after expiry date of periodical audit, CCS will suspend approval certificate according to the provisions of 3.1.8.2. If service firm of inspection and testing does not submit application for periodical audit to CCS within 3 months after suspension of approval certificate, CCS will cancel approval certificate according to the provisions of 3.1.8.3.

3.7.7 Renewal audit

3.7.7.1 Where renewal of the Firm Approval Certificate is necessary at its expiry, the service firm of inspection and testing is to send a written application to CCS within 3 months before the expiry date of the certificate and inform CCS of any change to the approval certificate and the quality system.
3.7.7.2 The document review, on-site audit, approval test and issue of the Firm Approval Certificate are to be in accordance with 3.7.2 to 3.7.5.

3.7.8 Changes to approval certificate

3.7.8.1 Within period of validity of approval certificate for service firm of inspection and testing, if firm name and address are changed or inspection item and scope are added, changes to approval certificate may be applied according to CCS relevant requirements.

3.7.9 Additional audit

3.7.9.1 Additional audits may be required to the service firm of inspection and testing at the discretion of CCS.

Section 8 CLASS NOTATIONS FOR PRODUCTS

3.8.1 General requirements

3.8.1.1 Class notations are certificate identification that CCS confirms that marine products meet additional requirements of CCS by such means as document examination, on-site audit and type test.
3.8.1.2 Audit and test requirements for product class notations are to meet guidelines relating to CCS class notations.
3.8.1.3 For marine products with CCS approval and inspection requirements, the applicant is to complete relevant approval and inspection at first (for requirements, see Appendix of this Chapter).
3.8.1.4 Class notations applicable to marine products include but not limited to in Table 3.8.1.4.

Class Notations for Marine Products **Table 3.8.1.4**

Class notation	Applicable products	Description	Technical requirements to be complied with
Asbestos-free	All marine products	Asbestos-free	Resolution MSC.282(86) − Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended
Hong Kong Convention	All marine products	To meet requirements of Hongkong Convention on control of harmful	Appendixes 1 and 2 of the Hong Kong International Convention for the Safe and Environmentally Sound Recycling of Ships,

Class notation	Applicable products	Description	Technical requirements to be complied with
		substances	2009, and resolution MEPC.269(68) − 2015 Guidelines for the Development of the Inventory of Hazardous Materials
EU Ship Recycling Regulation	All marine products	To meet requirements of EU Regulation on ship control of harmful substances	EU 1257/2013 Regulation on ship recycling
E-Noise	Machinery	Noise resource products are subject to vibration and noise inspection according to the requirements of CCS guidelines	Resolution MSC.337(91) − Code on Noise Levels on Board Ships and CCS Guidelines for Control and Measurement of Noises for Ships and Marine Products
SLC1, SLC2, SLC3	Marine computer system (including programmable electronic system)	Safe and reliable assessment of the marine software	CCS Guidelines for Safe and Reliable Assessment of the Marine Software

3.8.2 Document examination

3.8.2.1 The applicant is to submit a signed application for works/type approval/product inspection or application for class notation approval, indicating product scope involved by approval, and submit following documents for examination:

(1) approval certificate and/or marine product certificate (if applicable);

(2) drawings and documents indicating requirements for product structure type, production technology, raw material, components and parts (or documents required by CCS for approval and inspection);

(3) approval test programme (if applicable);

(4) other documents required by CCS class notations.

3.8.2.2 CCS examines documents submitted by the applicant, approves approval test programme and returns them to the applicant.

3.8.3 On-site audit

3.8.3.1 On-site audit includes product confirmation and quality system check.

3.8.3.2 Product confirmation is compliance verification whether product structure type, production technology, raw material, components and parts meet documents submitted by the applicant. For products with CCS approval and inspection requirements, it is to confirm whether above contents are consistent with conditions for approval and inspection.

3.8.3.3 Quality system audit is audit verification whether manufacturer's quality system meets ISO 9001 standard according to relevant guidelines on CCS class notations.

3.8.4 Approval test

3.8.4.1 It is carried out according to approved test programme.

3.8.4.2 Test is generally carried out by service firm of inspection and testing approved by CCS.

3.8.5 Class notations and class notation approval certificate

3.8.5.1 After completion of document examination, on-site audit and approval test according to the requirements of 3.8.2 to 3.8.4, CCS will issue the following certificates with class notations:

(1) for marine products with CCS approval and inspection requirements, the obtained class notations will be reflected in column of class notations for approval and/or marine product certificate;

(2) for marine products without CCS approval and inspection requirements, CCS will issue approval certificate for class notations of marine products valid for not more than 5 years.

3.8.6 Class notation approval renewal audit

3.8.6.1 Class notation approval renewal audit is to be carried out 3 months before expiry date of certificate. The manufacturer is to submit written application to CCS, and inform CCS of any change to product design. CCS is to:

(1) reexamine product drawings and technology documents and verify changes to product design, production technology, raw material or components and parts;

(2) carry out product on-site audit according to 3.8.3;

(3) if changes affect validity of approval, approval test is to be carried out according to reexamined test programme.

3.8.6.2 If there is no change to product design, production technology, raw material or components and parts, approval test may be exempted; if necessary, CCS may require a new test.
3.8.6.3 Where the manufacturer is found to remain in compliance with the conditions for class notation approval upon check, a new Class Notation Approval Certificate will be issued.

3.8.7 Changes to class notation approved products

3.8.7.1 The manufacturer is to supervise any change to the products or their manufacturing process, inform CCS of any major change and receive CCS assessment thereof.
3.8.7.2 Where any change is made to the design of the approved products and their components and parts, materials used or manufacturer and this affects the characteristics or performance criterion relating to product and class notations, a new approval is to be carried out.

Section 9 REQUIREMENTS FOR QUALITY SYSTEM CHECK

3.9.1 General requirements

3.9.1.1 Quality system check is a compliance evaluation carried out by CCS during type approval, works approval and class notation approval on whether manufacturer meets the requirements of ISO 9001 quality system.
3.9.1.2 Quality system check is usually applicable to following 4 types of work:
(1) initial, change or renewal of works approval;
(2) initial, change or renewal of type approval;
(3) initial, change or renewal of class notation approval;
(4) periodical audit of works approval and type approval.
3.9.1.3 Requirements for quality system check of class notation approval are shown in Section 8 of this Chapter. This Section is mainly applicable to quality system check of works approval, type approval and their periodical audit.

3.9.2 Contents of quality system check

3.9.2.1 General contents of quality system check of works approval and type approval B:
(1) Personnel: the manufacturer is to have sufficient and qualified inspectors and essential processes operators.
(2) Equipment: the manufacturer is to ensure that production equipment, technology equipment, test equipment and instruments used during production have and keep characteristics and conditions necessary for marine products to meet requirements and/or carry out process monitoring. For inspection, measuring and testing equipment (including measuring equipment and test software), effective control, calibration and maintenance systems are to be established and effective calibration and applicable conditions are to be kept.
(3) Environment: the manufacturer is to confirm and manage working condition necessary for products' compliance with requirements.
(4) Document management: the manufacturer's quality system is to establish review and control requirements for documents, purchasing documents, inspection documents and external documents necessary for production process preparation and operation.
(5) Purchasing link: the manufacturer is to establish evaluation criterion and management requirements for raw material and components and parts supplier complying with requirements of conventions and CCS rules, carry out effective quality control according to management requirements, preparation and maintenance of lists of suppliers of raw materials, main components and parts, and submission to CCS for information.
(6) Production link: the manufacturer is to establish appropriate production technology process, technology procedure and quality control point, to control any subcontract process affecting products' compliance with requirements.
(7) Inspection link: the manufacturer is to establish product inspection procedures complying with conventions, CCS rules or applicable standards and make them operate effectively.
(8) Identification: the manufacturer is to establish perfect identification and marking system, selected samples are to be able to be traced back to corresponding products, and finished products are to be able to be traced back to the source of main material and main components and parts for use.
(9) Control of non-conformities: the manufacturer is to establish non-conformity control procedure which is to meet the requirements of 3.1.4.10 of this Chapter.
3.9.2.2 Additional requirements for type approval A and Alternative Certification Scheme quality system check

(1) The manufacturer is to be familiar with CCS test and inspection requirements for approved marine products.
(2) Marine product test and inspection records are to be kept in complete and clear condition.
(3) The manufacturer is to be able to undertake marine product quality responsibilities.
(4) CCS marine product inspection experience, quality system check and customers' feedback show that product quality is continuously kept stable.
(5) The manufacturer has established documented quality assurance system.
(6) The manufacturer agrees to accept periodical audit on completion of CCS approval.
(7) The inspection, testing and certification of products comply with the submitted additional alternative quality control plan or standard quality control system.
3.9.2.3 Requirements for quality system check of periodical audit
(1) The use of product approval and inspection marks is to comply with the requirements of CCS rules.
(2) The purchasing of raw materials, components and parts of products is to comply with the provisions of quality system documents of the manufacturer.
(3) The supplier of important raw materials of products is to comply with the provisions of list of qualified supplier approved during approval.
(4) The inspection control of purchased important raw materials of products is to comply with the provisions of quality system documents of the manufacturer.
(5) The product produced after approval is to be consistent with product technology, raw materials, components and parts during the type testing.
(6) Final products and/or inspection and test items in the manufacturing are to comply with the provisions of the inspection plan approved during approval.
(7) Nameplate, usage identification, usage/operation instructions and quality certificate of products for ships engaged on international voyages are to include English.
(8) Product quality feedback, analysis and treatment are to comply with the relevant provisions.
(9) For the manufacturer to which Alternative Certification Scheme is issued, the consistency of manufacturing, inspection and testing of products with the quality control plan approved during approval is to be checked.

Section 10 ALTERNATIVE CERTIFICATION SCHEME

3.10.1 General requirements

3.10.1.1 During unit/batch inspection, the surveyor may reduce or exempt test items requiring witness by CCS and allow the manufacturer to carry out inspection and testing as its substitution.
3.10.1.2 The manufacturer using the Alternative Certification Scheme is to be approved by CCS in one or more modes.
3.10.1.3 For manufacturers using the Alternative Certification Scheme, the required inspection and testing are permitted in two versions with regard to traceability:
(1) The manufacture describes the relevant inspection, testing and certification additional to the manufacturer's standard quality control in order to meet the Rules. The components are to be stamped with a special stamp supplied by CCS or identified as required by CCS.
(2) The manufacturer has a standard quality control system which covers all required inspection, testing and certification in compliance with CCS rules. The traceability and the required type of product document for components or products are defined in the system.
3.10.1.4 The manufacturer using the Alternative Certification Scheme is to have the quality management system or the additional alternative quality control plan which covers all inspection, testing and certification in compliance with CCS rules. Where associated sub-suppliers or sub-contractors are needed, the quality management system of the sub-supplier or sub-contractor is to be included in the control requirements of the manufacturer, or a separate application may be made by the sub-supplier or sub-contractor.

3.10.2 Conditions

3.10.2.1 The conditions for the manufacturer to be granted the permission to carry out inspection and testing without the presence of a Surveyor are that:
(1) the manufacturer has a quality control system, current drawings, and Rules and standards that cover the product to be certified;
(2) the manufacturers (and designers, if producing under license) commit themselves to involve CCS when changes to the design, manufacturing process or testing are made as well as when any major production

problems or any major product delivery problems have occurred;
(3) the inspection and testing required by the Rules are either standard procedures in the Quality System and recognized by CCS or specified in detail in the quality control plan and other documents;
(4) if work certificates (W) or test reports (TR) are found not to fulfil the agreed standards, the component may not be accepted;
(5) CCS ascertains the manufacturer's compliance with the ACS requirements by verifying the required product by means of document review and field audit. Follow-up audit, renewal audits and additional audit are conducted by CCS on a regular basis to verify that conditions of the ACS are continuously maintained by the manufacturer;
(6) the agreed ACS may be suspended or cancelled where deemed necessary by CCS;
(7) additional audits may be required to the manufacturer and/or sub-supplier and sub-contractor as deemed necessary by CCS.

3.10.3 Drawing examination

3.10.3.1 The applicant is to submit an application, indicating the extent of the required inspection and testing, and the extent under which conditions the manufacturer may perform all or parts of the required inspection and testing without the presence of a Surveyor, including that of the sub-contracted components, and the following documents are to be submitted for examination:
(1) the additional alternative quality control plan which covers all required inspection, testing and certification in compliance with CCS rules, including the procedure of the components to be stamped with a special stamp supplied by CCS or identified as required by CCS; or the standard quality control system which covers all required inspection, testing and certification in compliance with CCS rules, including the procedure of the traceability and the required type of product document for components or products;
(2) the existing CCS class approvals of the manufacturer's products as far as required;
(3) quality control plans relevant to the products and relevant components. Such quality control plans are to describe the quality assurance, control methods and frequency used in the manufacturing process according to the technical requirements or standards of the products, reflecting in particular the inspection and test requirements of CCS rules, guidelines and/or conventions with an indication of which inspections and tests are delegated to the manufacturer and which are to be done in the presence of a CCS representative;
(4) list of nominated personnel for:
① marking/stamping of products;
② tests and inspection (responsible);
③ provision of data and information (e.g. declaration of conformity, test reports etc.);
(5) any other additional documents that CCS may require in order to evaluate the manufacturing processes and the product quality control.

3.10.4 On-site audit

3.10.4.1 For manufacturers applying for the Alternative Certification Scheme, the check of quality management system is to comply with the requirements of Section 9 of this Chapter.

3.10.5 Issuance and validity of Alternative Certification Scheme

3.10.5.1 CCS will issue the product inspection scheme attached with an Alternative Certification Scheme to a manufacturer at his request for whom the drawing examination and on-site audit have been completed according to 3.10.2 and 3.10.3 and who is found to comply with the following requirements:
(1) the requirements for approval of products in one or more modes are met, product quality assurance meeting requirements of ISO 9001, having an additional or standard CCS-approved procedure for ensuring that inspections and tests will be in accordance with CCS rules and guidelines;
(2) product quality is found upon CCS inspection and quality system check to be continually kept stable during the period of holding the approval certificate for one or more types of products;
(3) the operation of the quality management system for marine product is capable of achieving at least the results of the inspections and tests attended by CCS Surveyor.

Section 11 PRINCIPLE APPROVAL

3.11.1 General requirements

3.11.1.1 Principle approval as a technical certification service provided by CCS for new products and new technologies, is usually applied to :

(1) innovatively designed products that do not meet the requirements for type approval;
(2) innovatively designed complex system products;
(3) products of equivalent design which are different from traditional standard design;
(4) innovative technical principles or plans;
(5) evaluation service for scientific research achievements.

3.11.1.2 Unless otherwise expressly specified by the Rules, CCS does not require principle approval mandatorily. Principle approval is a technical certification service that clients voluntarily request CCS to provide during the development of new products and new technologies. The following services can be provided:
(1) providing customized service programs;
(2) ensuring an acceptable level of safety and reduce uncertainty in the later stage;
(3) meeting the needs of early market expansion;
(4) approving general technical plans;
(5) approving alternative design plans;
(6) avoiding the risk of unqualified system performance.

3.11.1.3 Principle approval is used to demonstrate its technical feasibility at an acceptable level of reliability and cost, as well as its basic safety to people and the environment, i.e. the design complies with recognized rules or is proved to be sufficiently safe through risk assessment. For new technologies in the concept design stage, verification of the technical feasibility alone may be carried out.

3.11.1.4 Principle approval is the approval in principle for new products and new technologies. Where there is a clear requirement for approval of the product in the requirements for certification in the Appendix of this Chapter, other corresponding certificates of approval are to be obtained prior to installation onboard.

3.11.1.5 Principle approval only needs initial approval, which is only applicable to the technical status at the time of approval, and the certificate is valid for a long time.

3.11.1.6 Principle approval may be used as technology certification services for new products or new technologies with different degrees of technical maturity, such as concept design, principle prototype, engineering prototype, and finalized design.

3.11.1.7 For products with different degrees of technical maturity, some provisions of other chapters and sections on marine product inspection may not be applicable.

3.11.1.8 In view of the diversity of target service market and client demand for principle approval, in order to provide accurate service, generally the target to be achieved, the scope and the content of approval can be clearly defined through the pre-contract service.

3.11.1.9 Principle approval may be in the form of technical plan review, target function assessment, simulation test analysis, prototype verification test, rule compliance review, risk assessment, expert review, etc., as shown in Figure 3.11.1.9.

3.11.1.10 For principle approval in the design and development stage, plan approval, test and analysis can be conducted interactively at the same time.

3.11.1.11 Prototype verification test is a comprehensive means for technical feasibility verification. Prototype test is to be carried out unless the technology is start-up or easy to evaluate.

3.11.1.12 When there is a lack of mature and reliable technical rules or standards in principle approval, it is necessary to conduct risk assessment. For start-up technology, when the client has not completed the safety assessment, exemption may be granted according to the client entrustment.

3.11.1.13 For mature or innovative design concepts approved in principle approval, its technical plan, technical principle and alternative design plan can be used as the basis for CCS approval in subsequent plan approval and approval. The following supporting documents may be included:
(1) principle approval certificate;
(2) design plan and drawing documents approved in principle;
(3) the enterprise standard or design rules formed by recognized mature technical principles.

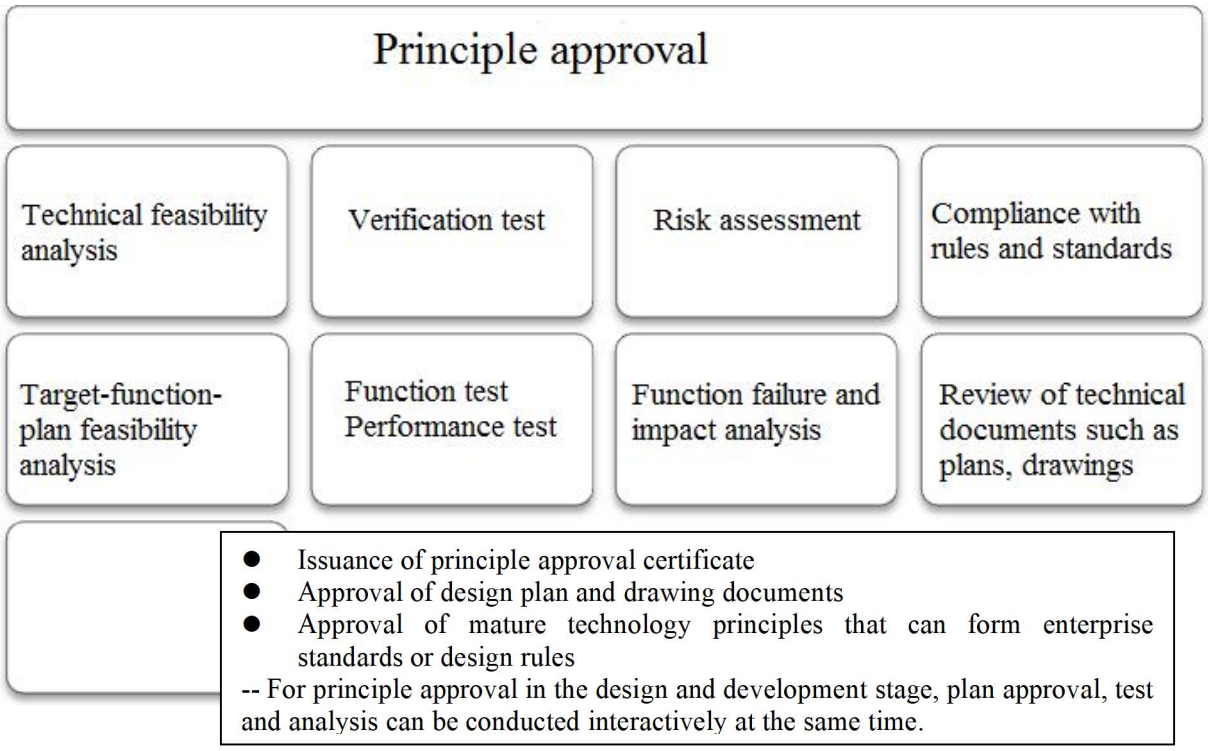

Figure 3.11.1.9 Principle approval

3.11.2 Feasibility review of technical plans

3.11.2.1 Technical feasibility analysis is the basic work of principle approval, which is intended to prove that the product can achieve preset functions. Verification can be carried out by means of basic principle analysis, objective and function analysis, review of recognized standards, prototype test, etc.

3.11.3 Review of technical documents such as plans, drawings

3.11.3.1 The purpose of review of the compliance with rules is to ensure safety, and the safety of the prototype to be tested need be guaranteed.

3.11.3.2 Where there are applicable rules and/or standards as the basis for product approval, the drawings and technical documents provided are to be reviewed according to the development stage of the product, as far as practicable, according to the requirements of CCS for plan approval.

3.11.4 Review of risk assessment reports

3.11.4.1 For products to be tested on board or for prototype test, in order to ensure the safety in the test process, risk assessment is to be conducted when there is no available rules or standards.

3.11.4.2 When the design plan involves alternative design of CCS rules, conventions or regulations, the risk assessment is to be structured and in accordance with the IMO MSC.1/Circ.1455 on Guidelines for Approval of Alternative and Equivalent Designs.

3.11.4.3 Risk analysis of complex systems with significant safety implications may be carried out by a third party.

3.11.5 Prototype verification test

3.11.5.1 Prototype for test is to be manufactured according to the technical stage of product development, which may include laboratory testing machine, principle prototype and engineering prototype.

3.11.5.2 Unless the technology is in the concept design stage or is easy to be confirmed, prototype verification test is normally to be conducted.

3.11.5.3 The prototype is to be inspected and marked by a surveyor to confirm its consistency with the submitted technical plans and drawings, and its compliance with the applicable rules and/or standards for approval, or the technical requirements of the client for the product.

3.11.5.4 The prototype is usually used to verify the core technology in the technical plan. In CCS principle approval, the surveyor is usually only required to participate in the test to prove technology relevance based on client's demand. Verification tests are to take into account CCS rules and guidelines, applicable standards, or the product performance and environment specified in the technical requirements of the client for the product. Test items are to meet the needs of technical verification and are to be submitted to CCS for approval.

3.11.5.5 The test report is to meet the requirements of 3.2.4 of this Chapter.

3.11.5.6 The acceptability of any test results obtained in the absence of a CCS surveyor will be given special consideration if the required test has been or is being carried out by an independent product test organization accepted by CCS. For details, see 3.2.4.4.

3.11.6 Issuance of principle approval certificates and approval of client product specifications

3.11.6.1 If a product is evaluated in accordance with this Section and deemed to comply with CCS rules, guidelines, applicable standards and/or the technical requirements of the client for the product, CCS will issue a certificate of principle approval.

3.11.6.2 Principle approval certificate has no validity period and is only applicable to the technical status at the time of approval.

3.11.6.3 For technical plan and design principle with mature technology approved in the principle approval, if they have been proved to meet the applicable approval basis, the client can form the enterprise standard or product technical specification, which can be used as the design basis for other products after CCS approval.

3.11.7 Changes in approval

3.11.7.1 If a product and/or technology subject to CCS principle approval has been subject to design changes or changes in applicable standards, the approval certificate will cease to be valid. The principle approval does not need changes in approval, and the client can apply for design approval and type approval to CCS after the technology is mature. If the client still requires principle approval, a new one can be applied.

Appendix 1A LIST OF CERTIFICATION REQUIREMENTS FOR CLASSED MARINE PRODUCTS

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
Material									
1	Metal material								
1.1	Rolled steel	X	–	–	–	–	X	–	Applicable to rolled steel for ships and offshore installations
1.2	Aluminum alloy	X	–	–	–	–	X	–	Applicable to aluminum alloy plate and section (including bar and pipe) for hull as well as aluminum alloy required by plan approval or strength calculation
1.3	Other non-ferrous metal material	X	–	–	–	–	X	–	Such as titanium and titanium alloy, copper and copper alloy, etc.
1.4	Steel wire rope	X	–	–	–	–	X	–	Applicable to towing and mooring ropes for towing ships, steel wire rope for lifting appliances and steel wire rope substituting anchor chain
2	Non-metallic material								Refer to Appendix 1D for the requirements for non-metallic materials for liquefied natural gas cargo tanks and fuel tanks
2.1	Resin	–	X	–	–	–	X	–	
2.2	Reinforcement material	–	X	–	–	–	X	–	
2.3	Fiber rope	X	–	–	–	–	X	–	Towing and mooring ropes for towing ships
2.4	Epoxy casting material for seating	–	X	–	–	–	X	–	For filling seating clearance of main engine, auxiliary engine and deck machinery
2.5	Synthetic (bearing) material	–	X	–	–	–	X	–	Nonmetallic synthetic material for bearings of rudder stock, rudder pin, rudder axle and stern shaft
2.6	Heat-insulating material	–	X	–	–	–	X	–	Applicable to refrigerated ship
2.7	Cargo bearer	–	X	–	–	–	X	–	Applicable to tanker with independent tanks type C
2.8	Cargo hold supporting gaskets	–	X	–	–	–	X	–	Applicable to tanker with independent tanks type C
2.9	Wrapping material of the propeller shaft	–	X	–	–	–	X	–	For ships with water-lubricated screwshaft condition monitoring (SCM) system applying for the class notation SCM
2.10	Structural adhesives	—	X	—	—	—	X	—	
3	Welding consumables								
3.1	Electrode	–	X	–	–	–	X	–	
3.2	Wire	–	X	–	–	–	X	–	
3.3	Flux	–	X	–	–	–	X	–	
4	Corrosion resistant means								
4.1	Shop primer	–	X	–	–	–	X	–	For temporary protection after surface treatment of metal material
4.2	Coating below ship's waterline	–	X	–	–	–	X	–	Including bottom anti-corrosive paint, bottom anti-fouling paint and anodic shielding
4.3	Coating above ship's waterline	–	X	–	–	–	X	–	Including marine anti-corrosive paint, marine waterline paint, hull paint, deck paint, cargo hold paint and internal compartment finish coating
4.4	Ship tank coating	–	X	–	–	–	X	–	Including marine drinking water

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
									tank paint, ship ballast tank paint, ship oil tank paint, crude oil tanker cargo oil tank paint and engine room bottom paint
4.5	Sacrificial anode	X	–	–	–	–	–	–	
4.6	Cathodic protection system	X	–	–	–	–	–	X	
Hull									
5	Hull structure equipment	X	–	–	–	–	X	X	
5.1	Stem, stern post, rudder horn, propeller shaft bracket and fore wheel bearing seating	X	–	–	–	–	–	X	Applicable to all forgings and castings integral to hull, and carrying out inspection and certification to roughly machined forgings and castings
5.2	Hatch cover	X	–	–	–	–	–	X	
5.3	Window	X	–	–	–	–	–	X	Watertight window, airtight window, bridge window
5.4	Bow, stern and gangway doors	X	–	–	–	–	–	X	Including control, indication and alarm
5.5	Watertight door	X	–	–	–	–	–	X	Including control, indication and alarm
5.6	Watertight cable transits	—	X	—	X	—	—	X	
5.7	Portable means of access for inspections	X	–	–	–	–	–	X	Applicable to portable means of access for inspections listed according to approved ship structure access manual and kept on board (extension ladder type and cradle type lifting by winch)
5.8	Container securing arrangements	X	–	–	–	–	–	X	Applicable to container ships and non-container ships applying for class notation of container securing arrangements
5.9	Loading computer	–	X	–	X	–	–	X	Applicable to hardware, product inspection is not necessary for the ship provided with two loading computers
6	Outfitting								
6.1	Rudder blade	X	–	–	–	–	–	X	Raw material and products with finish machining are required to be inspected, requirements for raw material are shown in Appendix 2A
6.2	Rudder stock and pintle	X	–	–	–	–	–	X	Raw material and products with finish machining are required to be inspected, requirements for raw material are shown in Appendix 2A
6.3	Rudder bearing and pin bearing	X	–	–	–	–	–	X	Raw material and products with finish machining are required to be inspected, requirements for raw material are shown in Appendix 2A
6.4	Rudder stock connecting bolt	X	–	–	–	–	–	X	Raw material and products with finish machining are required to be inspected, requirements for raw material are shown in Appendix 2A
6.5	Single point mooring arrangement	X	–	–	X	O	–	X	Only spare parts need inspection and certificate
6.6	Emergency towing arrangement	X	–	–	X	O	–	X	Only spare parts need inspection and certificate, applicable to oil tankers, liquefied gas carrier and dangerous chemical carrier more than 20,000 tonnes deadweight

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
6.7	Towing hook	X	–	–	–	–	–	X	Applicable to towing vessels of ship type
6.8	Towing winch	X	–	–	–	–	–	X	Applicable to towing vessels of ship type, and the first product is to be subject to type test
6.9	Seats of high speed craft	–	X	–	X	–	–	X	Applicable to high speed craft
6.10	Accommodation ladder, ramp	X	–	–	–	–	–	X	
7	Anchoring and mooring equipment								
7.1	Anchor chains and fitting	X	–	–	–	–	X	O	Plan approval is only required for unmarked anchor chain fitting
7.2	Anchors and accessory	X	–	–	–	–	X	X	
7.3	Chain stopper	X	–	–	–	–	–	X	
7.4	Cable clenches	X	–	–	–	–	–	X	Applicable to cable clenches with watertight requirements in regulation 22-2 of Load Line Convention
7.5	Windlass	X	–	–	–	–	–	X	The first product is to be subject to type test
7.6	Mooring winch and capstan	X	–	–	–	–	–	X	The first product is to be subject to type test
7.7	Winch or capstan for operation	X	–	–	–	–	–	X	Applicable to working ships, and the first product is to be subject to type test
Machinery (including machinery equipment of refrigerated vessels)									
8	Pumps and piping								Refer to Appendix 1D for the additional requirements for pumps and piping included in liquefied natural gas specialized products
8.1	Bilge pump and bilge injection pump	X	–	–	X	O	–	X	
8.2	Ballast pump	X	–	–	X	O	–	X	
8.3	Liquid cargo pump, stripping pump and tank cleaning pump	X	–	–	X	O	–	X	Oil tanker, tanker carrying liquefied gas in bulk and tanker carrying dangerous chemicals in bulk
8.4	Fuel oil pump	X	–	–	X	O	–	X	Including gas fuel pump
8.5	Fuel oil injection valve cooling pump	X	–	–	X	O	–	X	
8.6	Lubricating oil pump	X	–	–	X	O	–	X	Lubricating oil pump for diesel engine and gearbox
8.7	Fire pump (including emergency fire pump)	X	–	–	X	O	–	X	
8.8	Cooling water pump	X	–	–	X	O	–	X	Cooling water pump for diesel engine
8.9	Boiler feed pump	X	–	–	X	O	–	X	
8.10	Boiler circulating water pump	X	–	–	X	O	–	X	
8.11	Hot oil circulating pump	X	–	–	X	O	–	X	
8.12	Condensate pump	X	–	–	X	O	–	X	Condensate pump for main condenser, gas pump and circulating pump
8.13	Pipes of more than 50 mm in diameter for piping of Classes I and II and fittings (flange, bend and three-way, etc.)	X	–	–	–	–	X	–	
8.14	Pipes of 50 mm in diameter and below for piping of Classes I and II and fittings (flange, bend	–	X	–	–	–	X	–	

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
	and three-way, etc.)								
8.15	Pipes for piping of Class III and fittings (flange, bend and three-way, etc.)	–	X	–	–	–	X	–	
8.16	Valves of 50 mm in diameter and over for piping of Classes I and II, valves of 300 mm in diameter and over for piping of Class III; sea valve; (operation temperature below -55℃) low temperature valve	X	–	–	X	O	–	X	
8.17	Valves of less than 50 mm in diameter for piping of Classes I and II	–	X	–	X	–	–	X	
8.18	Plastic pipe	–	X	–	–	–	X	–	Applicable to pipes mentioned in Appendix 1, Chapter 2, PART THREE of the Rules, also applicable to the plastic pipes used on the machinery
8.19	Flexible hose assembly, for piping of Classes I and II or more than 50 mm in diameter	X	–	–	X	O	–	X	For fuel oil, lubricating oil, hydraulic and hot oil system, fresh water and sea water cooling system, compressed air system, bilge and ballast system, also applicable to the flexible hoses used on the machinery of the above systems
8.20	Flexible hose assembly: except for above-mentioned	O	X	–	X	–	–	X	For fuel oil, lubricating oil, hydraulic and hot oil system, fresh water and sea water cooling system, compressed air system, bilge and ballast system as well as Class III steam piping system; C/E is necessary for gas pipe; applicable to the flexible hoses used on the machinery of the above systems
8.21	Mechanical pipe joint	–	X	–	X	–	–	X	
8.22	Corrugated expansion joint	–	X	–	X	–	–	X	
8.23	Air pipe closing appliance	X	-	–	X	–	–	X	
8.24	Spark arrester	–	X	–	X	–	–	X	
8.25	Sound damper	–	X	–	X	–	–	X	
8.26	Filter	X	–	–	–	–	–	X	For fuel oil, lubricating oil, sea water, fresh water system
8.27	Fume exhaust valve	–	X	–	X	O	–	X	
9	Boiler and pressure vessel								
9.1	Boiler	X	–	–	–	–	X	X	Including hot oil boiler
9.2	Boiler burner	X	–	X	O	O	–	X	
9.3	Economizer	X	–	X	O	O	–	X	
9.4	Steam generator (over 0.35 MPa)	X	–	X	O	O	–	X	
9.5	Thermal oil and thermal water heating units (for service of propulsion machinery)	X	–	X	O	O	–	X	For heating oil and water for heat conduction
9.6	Safety valve	X	–	–	X	O	–	X	For boiler and air receiver, when kept on board separately
9.7	Boiler liquid meter	–	X	–	X	–	–	X	

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
9.8	Classes I and II pressure vessel	X	–	–	–	–	X	X	Air receiver, accumulator, etc.
9.9	Class III pressure vessel	X	–	–	–	–	O	X	Air receiver, accumulator, pressure tank, etc.
9.10	Heat exchanger	X	–	X	O	O	–	X	For heat exchange of fresh water, lubricating oil, hydraulic oil, fuel oil, steam and cooling systems
10	Machinery equipment								
10.1	Steam turbine	X	–	–	X	O	–	X	
10.2	Gas turbine	X	–	–	X	O	–	X	
10.3	Diesel engine	X	–	O	X	O	–	X	Dual fuel diesel engine and gas fuel engine are referred to this requirement
10.4	Air compressor	X	–	X	O	O	–	X	For 1) actuation / emergency actuation; 2) gas control system; 3) air compressor as replacement of spare air charging bottle of fireman's outfit
10.5	Oil separator	X	–	X	O	O	–	X	
10.6	Fuel oil supply unit	X	–	–	–	–	–	X	
10.7	Fan	X	–	X	O	O	–	X	For category A machinery space, cargo pump tank and other hazardous zone
10.8	Refrigerating plant	X	–	–	–	–	–	X	When there is class notation of cargo refrigeration
10.9	Hydraulic power plant	X	–	–	–	–	–	X	
10.10	Cargo compressor	X	–	–	–	–	–	X	Including compressor for gas fuel, for use by LPG carriers; Refer to Appendix 1D for LNG carriers or LNG dual fuel powered ships
10.11	Monitor, foam monitor	X	–	–	X	O	–	X	Applicable to external fire-fighting of fire-fighting ships applying for class notations of Fire Fighting Ship N
10.12	Steering arrangements								In addition to the steering gear, steering arrangements also include heading control system, rudder indicator, simplified operation box, starting box and alarm box for steering arrangements
10.12.1	Steering gear (of or more than 630 kNm)	X	—	—	–	–	–	X	1. The quality system of the steering gear manufacturer is to be satisfactorily audited by CCS; 2. The components that transmit mechanical force to the rudder stock are to be satisfactorily inspected by CCS; 3. The efficiency of the rudder steering mechanism is to be satisfactorily verified by the prototype test; 4. The hydraulic pump set is to be subjected to a load test and satisfactorily inspected by CCS
10.12.2	Steering gear (below 630 kNm)	X	—	—	X	O	—	X	
10.12.3	Heading control system								This product is a statutory product and the requirements for its certification are shown in Appendix 1B 4.12
10.12.4	Rudder indicator								This product is a statutory product and the requirements for its certification are shown in

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
									Appendix 1B 4.5
10.12.5	Simplified operation box, starting box and alarm box for steering arrangements								See Appendix 1A, 13.11 for certification and inspection requirements
10.13	Fin stabilizer, vortex absorbed fin	X	–	–	–	–	X		
10.14	Foundation bolts of main engines	X	—	—	—	—	—	—	Applicable to engines with cylinder diameter >300 mm; inspection is to be carried out according to the drawing of arrangement of foundation of main engine provided by the diesel engine manufacturer. The drawing is to include the following: Bolts (Mounting bolts and tightening bolts) Quantity, bolt diameter, bolt material (grade and performance), tightening bolt arrangement, thrust block arrangement
10.15	Hydraulic cylinder	X	–	–	–	–	–	X	
10.16	Hydraulic motor	X	–	–	–	–	–	X	
11	Gear transmission arrangement								
11.1	Gearbox	X	–	–	X	O	–	X	Applicable to gear transmission arrangement of main propulsion machinery for transmitting maximum continuous power of not less than 220 kW and essential auxiliary engine of not less than 110 kW
11.2	Gearbox	X	–	–	–	–	–	X	Applicable to gear transmission arrangement of main propulsion machinery for transmitting maximum continuous power of less than 220 kW and essential auxiliary engine of less than 110 kW
12	Shafting and propeller								
12.1	Thrust shaft	X	–	–	–	–	–	X	Machining inspection, requirements for raw material are shown a in Appendix 2A
12.2	Intermediate shaft and bearing	X	–	–	–	–	–	X	Machining inspection, requirements for raw material are shown a in Appendix 2A
12.3	Stern tube shaft, propeller shaft	X	–	–	–	–	–	X	Machining inspection, requirements for raw material are shown a in Appendix 2A
12.4	Stern tube	X	–	–	–	–	–	X	
12.5	Stern tube sealing device	–	X	–	X	–	–	X	Applicable to oil-lubricated stern shaft and water-lubricated stern shaft
12.6	Stern tube bearing	X	–	–	–	–	X	X	
12.7	Propeller	X	–	–	–	–	X	X	
12.8	Adjustable pitch propeller	X	–	–	–	–	–	X	
12.9	Z propulsion arrangement	X	–	–	–	–	–	X	The first product of the same model is to be subject to type test
12.10	Side thruster	X	–	–	–	–	–	X	The first product of the same model is to be subject to type test
12.11	Water jet propulsion arrangement	X	–	–	–	–	–	X	The first product of the same model is to be subject to type test

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
12.12	Other thrusters	X	–	–	–	–	–	X	The first product of the same model is to be subject to type test
12.13	Elastic coupling	X	–	–	X	O	–	X	
12.14	Non-elastic coupling	X	–	–	–	–	–	X	
12.15	Shafting connecting bolt	X	–	–	–	–	–	X	
12.16	Steel adjustable packing block	–	X	–	X	–	–	X	
12.17	Vibration isolator	–	X	–	X	–	–	X	
12.18	Cycloidal steering oar	X	–	–	–	–	–	X	
Electrical installations and automatic equipment									
13	Electrical installations								
13.1	Generators (50 kVA and over)	X	–	–	X	O	–	X	
13.2	Generators (below 50 kVA)	–	X	–	X	–	–	X	
13.3	Generating sets (50 kVA and over)	X	–	–	–	–	–	X	
13.4	Emergency generating sets	X	–	–	–	–	–	X	
13.5	Motors (50 kW and over)	X	–	–	X	O	–	X	
13.6	Motors (below 50 kW)	–	X	–	X	–	–	X	
13.7	Main switchboard	X	–	–	–	–	–	X	
13.8	Emergency switchboard	X	–	–	–	–	–	X	
13.9	Group starter panel	X	–	–	–	–	–	X	
13.10	Charging and discharging panel	X	–	–	–	–	–	X	
13.11	Electrical control box (associated with essential equipment)	X	–	–	–	–	–	X	For the definition of essential equipment, refer to paragraph 1.1.2.1(1), Chapter 1, PART FOUR of the Rules; for marine propulsion power limitation
13.12	Power, control and communication cables and wires	X	–	–	–	–	X	X	Including optical fiber and network cables in control and communication cables
13.13	Transformers (50 kVA and over)	X	–	–	X	O	–	X	For power and lighting
13.14	Transformers (below 50 kVA)	–	X	–	X	–	–	X	For power and lighting, and single phase transformers rated at 1 kVA or more and 3-phase transformers rated at 5 kVA or more
13.15	Battery	–	X	–	X	–	–	X	For actuation of main and auxiliary engines or spare/emergency power supply
13.16	Power conversion devices (charger, frequency converter, etc.)	X	–	–	X	O	–	X	Charger for charging emergency battery, frequency converter of 50 kW and over
13.17	Uninterrupted Power Supply (UPS) (50 kVA and over)	X	–	–	X	O	–	X	For application, refer to 3.9.1, Chapter 3, PART FOUR of the Rules; for marine propulsion power limitation
13.18	Uninterrupted Power Supply (UPS) (below 50 kVA)	—	X	—	X	O	—	X	For application, refer to 3.9.1, Chapter 3, PART FOUR of the Rules; for marine propulsion power limitation
13.19	Additional emergency illumination equipment	–	X	–	X	O	–	X	For passenger ships with ro-ro cargo spaces or special spaces (refer to 2.2.2.3, Chapter 2, PART FOUR of the Rules)
13.20	Cable management system	X	–	–	–	–	–	X	Applicable to ships applying for class notation of shore power
13.21	Distribution panel for shore power connection	X	–	–	–	–	–	X	
13.22	Control panel for shore	X	–	–	–	–	–	X	

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
	power switch in								
13.23	Lighting fitting	–	X	–	X	–	–	X	
13.24	Electrical heater	X	–	–	–	–	–	X	For heating combustible medium such as fuel oil and lubricating oil
13.25	Explosion-proof motor	X	–	–	X	O	–	X	
13.26	Explosion-proof lamp	—	X	—	X	—	—	X	
13.27	Other explosion-proof electrical equipment 1	X[1]	X[1]	–	X[1]	–	–	X	Applicable to electrical products for which the certification requirements are specified in the List of Certification Requirements (such as sensor, meter, detector and control box/cabinet, etc.)
13.28	Engine telegraph	–	X	–	X	–	–	X	
13.29	Sound-powered telephone	–	X	–	X	–	–	X	
13.30	Engineer‘s alarm system	X	–	–	X	O	–	X	
13.31	Automatic start device of generators	X	–	–	–	–	–	X	
13.32	Combined visual and audible alarm panel (box)	X	–	–	–	–	–	X	
14	Automatic equipment								
14.1	Propulsion machinery control system	X	–	–	X	O	–	X	
14.2	Engine room monitoring and alarm system	X	–	–	X	O	–	X	
14.3	Level measuring system	X	–	–	X	O	–	X	For level measuring outside cargo tank
14.4	Pressure, temperature, level measuring alarm system	X	–	–	X	O	–	X	Applicable to cargo tank
14.5	Valve remote control system	X	–	–	X	O	–	X	Including manual valve remote control system for emergency maneuvering
14.6	Dynamic positioning control system	X	–	–	X	O	–	X	
14.7	EOM system computer	–	X	–	X	–	–	X	Applicable to hardware, type approval is not necessary for two equipped computers which are standby each other. For ships applying for EOM notation
14.8	Shaft power meter	–	X	–	X	O	–	X	For ships applying for EOM notation; for marine propulsion power limitation
14.9	Flowmeter	–	X	–	X	O	–	X	For ships applying for EOM notation

Symbols:
1) C – Marine Products Certificate; E – Equivalent document; W – Manufacturer’s document; X – Applicable; O – Optional.
2) DA – Design approval; TA-B – Type approval B; TA-A – Type approval A; WA – Works approval.
3) X[1]: The certification requirements for such explosion-proof product are consistent with those for the existing non explosion-proof product of the same type.

Appendix 1B① LIST OF CERTIFICATION REQUIREMENTS FOR STATUTORY MARINE PRODUCTS

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
1	Life-saving appliances								
1.1	Lifebuoy	X	–	–	X	O	–	X	
1.2	Position-indicating lamp for life-saving appliances	–	X	–	X	–	–	X	Including: (a) for lifebuoy; (b) for lifejacket
1.3	Spontaneous distress flare of lifebuoy	–	X	–	X	–	–	X	
1.4	Lifejacket	X	–	–	X	O	–	X	
1.5	Immersion suit, anti-exposure suit	X	–	–	X	O	–	X	
1.6	Thermal protective aid	–	X	–	X	–	–	X	
1.7	Visual signal	–	X	–	X	–	–	X	Including: (a) rocket parachute flare; (b) hand flare; (c) buoyant smoke signal
1.8	Line-throwing appliance	–	X	–	X	–	–	X	
1.9	Life rafts	X	–	–	X	O	–	X	
1.10	Life boats	X	–	–	X	O	–	X	
1.11	Rescue boats	X	–	–	X	O	–	X	
1.12	Lowering apparatus	X	–	–	X	O	–	X	
1.13	Marine evacuation system	X	–	–	X	O	–	X	
1.14	Rescue equipment for person falling into water	X	–	–	X	O	–	X	Effective means for recovering the survival from water surface and transferring them from rescue equipment or life boat to the ship
1.15	Embarkation ladder	X	–	–	–	–	–	X	
1.16	Public address system	X	–	–	X	O	–	X	
1.17	General emergency alarm system	X	–	–	X	O	–	X	
2	Pollution prevention at sea								
2.1	Oil-filtering equipment	X	–	–	X	O	–	X	Oil content of effluent not exceeding 15 ppm
2.2	Oil/water interface detector	X	–	–	X	O	–	X	
2.3	Existing oil-filtering equipment (additional treatment equipment in MEPC.60(33))	X	–	–	X	O	–	X	Oil content of effluent not exceeding 15 ppm
2.4	Oil discharge monitoring and control system	X	–	–	X	O	–	X	For oil tanker
2.5	Sewage treatment plant	X	–	–	X	O	–	X	
2.6	Incinerator	X	–	–	X	O	–	X	
2.7	Nitrogen oxide analyzer (chemical luminescent detector (CLD) type/ heating chemical luminescent detector (HCLD) type)	X	–	–	X	O	–	X	For direct measurement of nitrogen oxide on board ship
2.8	Exhaust cleaning system(scheme A)	X	–	–	X	O	–	X	SOx emission compliance certificate
2.9	Exhaust cleaning system(scheme B)	–	–	–	–	–	–	X	To be implemented in accordance with 2.8 of this Table for ships flying the flag

① If the list is not consistent with the requirements of the flag State Government, the provisions of the flag State Government are to prevail.

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
									of China
2.10	Exhaust gas monitoring system	–	X	–	X	O	–	X	For exhaust gas emission monitoring
2.11	Discharge water monitoring system	–	X	–	X	O	–	X	For washwater discharge monitoring
2.12	Equipment reducing NO_x emission on board by other equivalent method	X	–	–	X	O	–	X	
2.13	Equipment limiting SO_x emission by other technology	X	–	–	X	O	–	X	
2.14	Diesel Oxidation Catalyst (DOC)	X	–	–	X	O	–	X	By means of an oxidation reaction, carbon monoxide (CO) and hydrocarbons (HC) (including fugitive methanol) in the exhaust gas are converted into harmless water (H_2O) and carbon dioxide (CO_2). This requirement also applies to equipment using other technologies to reduce emissions of carbon monoxide (CO) and hydrocarbons (HC) (including fugitive methanol)
2.15	NO_x emission of diesel engines of over 130 kW	X	–	–	X	O	–	X	EIAPP certificate
2.16	Ballast water management system	X	–	–	X	O	–	X	
2.17	Crude oil washing machine	X	–	–	X	O	–	X	
2.18	Comminuting and disinfecting system	X	–	–	X	O	–	X	For sewage
3	Fire-resisting material, structure and fire-fighting equipment								
3.1	Deck covering	–	X	–	–	–	X	–	
3.2	Non-combustible material	–	X	–	–	–	X	–	
3.3	Low flame spread material	–	X	–	–	–	X	–	Including: (a) decoration sheet; (b) paint; (c) floor; (d)insulation for cooling piping fittings; (e) adhesives for classes “A”, “B” and “C” division; (f) combustible duct
3.4	Vertical-mounted textile and film	–	X	–	–	–	X	–	Applicable to spaces of passenger ships with requirements for limited fire hazard
3.5	Soft cushion furniture	–	X	–	–	–	X	–	Applicable to spaces of passenger ships with requirements for limited fire hazard
3.6	Bedding	–	X	–	–	–	X	–	Applicable to spaces of passenger ships with requirements for limited fire hazard
3.7	Classes A, B and F fire division	–	X	–	X	–	–	X	
3.8	Class A fire window/side scuttle	X	–	–	X	O	–	X	
3.9	Class A and class B division penetrations	–	X	–	X	–	–	X	Including: 1. (a) cable penetration; (b) penetrations such as pipes,

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
									ducts and ports (for penetration piping made of steel 3 mm and over in thickness, not less than 900 mm in length or the equivalent material with no opening, certificate is not required); 2. class B division penetrations made of a steel sleeve, having a thickness of not less than 1.8 mm and a length of not less than 900 mm for pipe diameters of 150 mm or more and not less than 600 mm for pipe diameters of less than 150 mm, certificate is not required
3.10	Fire door	X	–	–	X	O	–	X	
3.11	Fire door control device	X	–	–	X	O	–	X	
3.12	Fire damper	X	–	–	X	O	–	X	
3.13	Flame-retarding material for furniture on high speed craft	–	X	–	–	–	X	–	
3.14	Flame-retarding material for high speed craft	–	X	–	–	–	X	–	Except for furniture
3.15	Fire division of high speed craft	–	X	–	X	–	–	X	
3.16	Fire division penetration of high speed craft	–	X	–	X	–	–	X	Including: (a) cable penetration; (b) penetration such as pipe, duct and port
3.17	Flame arrester	X	–	–	X	O	–	X	
3.18	Pressure vacuum valve	X	–	–	X	O	–	X	Including high speed venting valve and breathing valve
3.19	Bulkhead gearing	X	–	–	–	–	–	X	
3.20	Fixed gas fire-extinguishing arrangement (CO_2)	X	–	–	X	O	–	X	
3.21	Fixed equivalent gas fire-extinguishing arrangement	X	–	–	X	O	–	X	For machinery space and cargo pump tank
3.22	Equivalent gas fire-extinguishing arrangement (aerosol system)	X	–	–	X	O	–	X	For machinery space
3.23	Fixed local water-based fire-extinguishing arrangement	X	–	–	X	O	–	X	For machinery space of category A
3.24	Fixed water-based fire-extinguishing arrangement	X	–	–	X	O	–	X	For ro-ro space and special space
3.25	Fixed high-expansion foam fire-extinguishing arrangement	X	–	–	X	O	–	X	For machinery space and cargo pump tank protection
3.26	Fixed medium-expansion foam fire-extinguishing arrangement	X	–	–	X	O	–	X	For fixed deck system
3.27	Fixed low-expansion foam fire-extinguishing arrangement	X	–	–	X	O	–	X	For machinery space and deck protection
3.28	Foam fire-extinguishing medium	–	X	–	–	–	X	–	
3.29	Chemical dry powder fire-extinguishing arrangement	X	–	–	X	O	–	X	
3.30	Fixed pressure water	X	–	–	X	O	–	X	For a) cabin balcony; b)

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
	spray fire-extinguishing arrangement								machinery space and cargo pump tank
3.31	Sprinkler arrangement	X	–	–	X	O	–	X	For accommodation space, service space and control station (including fixed sprinkler arrangement for high speed craft)
3.32	Helicopter deck foam fire-extinguishing arrangement	X	–	–	X	O	–	X	Foam fire-extinguishing arrangement protecting helicopter deck
3.33	Fixed fire-extinguishing arrangement for gallery discharge duct	X	–	–	X	O	–	X	
3.34	Inert gas system	X	–	–	X	O	–	X	
3.35	Portable foam applicator	X	–	–	X	O	–	X	
3.36	Portable fire extinguisher	X	–	–	X	O	–	X	
3.37	Trolley type fire extinguisher	X	–	–	X	O	–	X	
3.38	Water jet/spray nozzle	–	X	–	X	–	–	X	
3.39	Fire hoses	–	X	–	X	–	–	X	
3.40	Fireman's protective clothing (insulation clothing)	–	X	–	X	–	–	X	
3.41	Lifeline	–	X	–	X	–	–	X	
3.42	Self-contained compressed air breathing apparatus	X	–	–	X	O	–	X	
3.43	Compressed air breathing apparatus	X	–	–	X	O	–	X	
3.44	Emergency escape breathing device	X	–	–	X	O	–	X	
3.45	Low location lighting system	–	X	–	X	–	–	X	
3.46	Equivalent low location lighting system	–	X	–	X	–	–	X	
3.47	Electrical safety lamp (explosion-proof electrical safety lamp)	–	X	–	X	–	–	X	For fireman's outfit specified in Chapter 3 of FSS Code
3.48	Portable oxygen concentration measuring device	X	–	–	X	O	–	X	
3.49	Fixed oxygen analyzing and gas detecting equipment	X	–	–	X	O	–	X	Refer to Appendix 1D for LNG carriers or LNG dual fuel powered ships
3.50	Fixed hydrocarbon gas detection system	X	–	–	X	O	–	X	Refer to Appendix 1D for LNG carriers or LNG dual fuel powered ships
3.51	Smoke detection system	X	–	–	X	O	–	X	
3.52	Fixed fire detection and alarm system	X	–	–	X	O	–	X	
3.53	Two-way portable radiotelephone apparatus of an explosion-proof type for fire-fighters	X	–	–	X	O	–	X	
4	Navigational equipment								
4.1	Magnetic compass	X	–	–	X	O	–	X	
4.2	Gyrocompass	X	–	–	X	O	–	X	
4.3	Propulsion indicator	–	X	–	X	–	–	X	
4.4	Side thrust, pitch and operational mode indicator	–	X	–	X	–	–	X	
4.5	Rudder indicator	–	X	–	X	–	–	X	
4.6	Propeller speed indicator	–	X	–	X	–	–	X	
4.7	Pitch indicator	–	X	–	X	–	–	X	

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
4.8	Rate-of-turn indicator	–	X	–	X	–	–	X	
4.9	Echo-sounding equipment	X	–	–	X	O	–	X	
4.10	Transmitting heading device (THD)	X	–	–	X	O	–	X	
4.11	Speed and distance measuring equipment (SDME)	X	–	–	X	O	–	X	
4.12	Heading control system (HCS)	X	–	–	X	O	–	X	
4.13	Track control system	X	–	–	X	O	–	X	
4.14	Integrated navigation system (INS)	X	–		X	–	–	X	
4.15	Integrated bridge system (IBS)	–	X	–	X	–	–	X	
4.16	Voyage data recorder (VDR)	X	–	–	X	O	–	X	
4.17	Simplified voyage data recorder (S-VDR)	X	–	–	X	O	–	X	
4.18	Electronic chart display and information system (ECDIS) and backup equipment, raster chart display system (RCDS)	X	–	–	X	O	–	X	
4.19	Electronic chart system (ECS)	X	–	–	X	O	–	X	
4.20	Multi-system electronic positioning equipment	X	–	–	X	O	–	X	
4.21	Global positioning system (GPS) receiver equipment	X	–	–	X	O	–	X	
4.22	Shipborne BEIDOU Satellite navigation system (BDS) receiver equipment	X	–	–	X	O	–	X	
4.23	9 GHz radar search and rescue transponders (SART)	X	–	–	X	O	–	X	
4.24	AIS SART equipment	X	–	–	X	O	–	X	
4.25	Automatic Identification System (AIS)	X	–	–	X	O	–	X	
4.26	Radar equipment	X	–	–	X	O	–	X	
4.27	Radar equipment with chart option	X	–	–	X	O	–	X	
4.28	Radar reflector—passive type	–	X	–	X	–	–	X	
4.29	Radar target intensifier	–	X	–	X	–	–	X	
4.30	Searchlight for high speed craft	–	X	–	X	–	–	X	
4.31	Night-vision unit for high speed craft	X	–	–	X	–	–	X	
4.32	Daylight signaling lamp	X	–	–	X	O	–	X	
4.33	Bridge navigational watch alarm system (BNWAS)	–	X	–	X	–	–	X	
4.34	Sound reception system	X	–	–	X	O	–	X	
4.35	Long-range identification and tracking system (LRIT)	X	–	–	X	O	–	X	
4.36	Ship’s electronic clinometer (navigation bridge)	X	–	–	X	O	–	X	
4.37	Pilot ladder	X	–	–	–	–	–	X	

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
4.38	Pilot's accommodation ladder	X	–	–	–	–	–	X

5	Radio communication equipment								
5.1	VHF radio installations capable of voice communication and digital selective calling (DSC)	X	–	–	X	O	–	X	
5.2	MF radio installations capable of voice communication and digital selective calling (DSC)	X	–	–	X	O	–	X	
5.3	MF DSC watch-keeping receiver	X	–	–	X	O	–	X	
5.4	M/HF DSC watch-keeping receiver	X	–	–	X	O	–	X	
5.5	Narrow-band direct printing telegraph equipment receiving safety information to ship by high frequency	X	–	–	X	O	–	X	
5.6	VHF DSC watch-keeping receiver	X	–	–	X	O	–	X	
5.7	NAVTEX receiver	X	–	–	X	O	–	X	
5.8	Enhanced group call receiver	X	–	–	X	O	–	X	
5.9	406 MHz emergency position-indicating radio beacon (COSPAS-SARSAT)	X	–	–	X	O	–	X	
5.10	BEIDOU emergency position-indicating radio beacon (BD-EPIRB)	X	–	–	X	O	–	X	
5.11	INMARSAT ship earth station	X	–	–	X	O	–	X	
5.12	MF/HF radio installation capable of voice communication narrow band direct-printing telegraph and digital selective calling (DSC)	X	–	–	X	O	–	X	
5.13	Portable survival craft two-way VHF radiotelephone apparatus	X	–	–	X	O	–	X	
5.14	VHF emergency position-indicating radio beacon	X	–	–	X	O	–	X	
5.15	Distress alarm panel	X	–	–	X	O	–	X	
5.16	Ship security alert system	X	–	–	X	O	–	X	
5.17	Aviation two-way VHF radiotelephone apparatus	X	–	–	X	O	–	X	
6	Equipment required by International Regulations for Preventing Collisions at Sea, 1972								
6.1	Navigation light	–	X	–	X	–	–	X	
6.2	Navigation light control panel	X	–	–	X	O	–	X	
6.3	Whistle	X	–	–	X	O	–	X	
6.4	Control panel of whistles	–	X	–	X	–	–	X	
6.5	Audible signal equipment	–	X	–	X	–	–	X

		C/E	W	DA	TA-B	TA-A	WA	PA	
	(bell and gong)								
7	SOLAS II-1 equipment								
7.1	Water ingress detection alarm system	X	–	–	X	O	–	X	
7.2	Transfer arrangements	X	–	–	–	–	–	X	Embarkation and disembarkation of personnel on board the ships constructed after January 1, 2010, to which SOLAS Chapter II-1, Part A-1 apply
8	SOLAS II-2 equipment								
8.1	Deep-fat cooking equipment	O	X	–	X	O	–	X	
8.2	Fire-extinguishing appliances of deep-fat cooking equipment	O	X	–	X	O	–	X	
8.3	Water fog applicator	—	X	—	X	—	—	X	For container ships
9	SOLAS XI-1 equipment								
9.1	Portable atmosphere testing instrument	X	–	–	X	O	–	X	
10	IBC and IGC Codes								
10.1	Cargo hose	O	X	–	X	O	–	X	Refer to Appendix 1D for LNG carriers or LNG dual fuel powered ships
11	Lights for helideck	–	X	–	X	–	–	X	Used for helideck boundary lights, floodlights, auxiliary floodlights, status lights, windsock lights, and obstruction lights

Symbols:
1) C – Marine Products Certificate; E – Equivalent document; W – Manufacturer's document; X – Applicable; O – Optional.
2) DA – Design approval; TA-B – Type approval B; TA-A – Type approval A; WA – Works approval.
Note: Other statutory marine products with certification requirements of the Administration are to be implemented as required by the Administration.

Appendix 1C LIST OF CERTIFICATION REQUIREMENTS FOR LIFTING APPLIANCES

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
1	Derrick system (including derrick type crane)	X	–	–	–	–	–	X	
2	Crane	X	–	–	–	–	–	X	
3	Engine room crane	X	–	–	–	–	–	X	
4	Submersible launching arrangement	X	–	–	–	–	–	X	
5	Lift	X	–	–	–	–	–	X	
5.1	Lift for passenger or crew	X	–	–	–	–	–	X	
5.2	Cargo and vehicle lift and vehicle ramp	X	–	–	–	–	–	X	
6	Telescope gangway	X	–	–	–	–	–	X	

Symbols:
1) C – Marine Products Certificate; E – Equivalent document; W – Manufacturer's document; X – Applicable; O – Optional.
2) DA – Design approval; TA-B – Type approval B; TA-A – Type approval A; WA – Works approval.

Appendix 1D LIST OF CERTIFICATION REQUIREMENTS FOR LIQUEFIED NATURAL GAS SPECIALIZED PRODUCTS

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
Liquefied natural gas carrier cargo containment system (membrane cargo tank)									
1	Materials/Component								
1.1	Adhesive	—	X	—	—	—	X	—	Used for bonding insulation materials and components.
1.2	Glass wool	—	X	—	—	—	X	—	
1.3	Glass cloth	—	X	—	—	—	X	—	
1.4	Load bearing mastic	—	X	—	—	—	X	—	
1.5	Reinforced polyurethane foam	X	—	—	—	—	X	—	
1.6	Perlite	—	X	—	—	—	X	—	
1.7	Insulating material	—	X	—	—	—	X	—	
1.8	Plywood	X	—	—	—	—	X	—	
1.9	Plywood Cleat	X	—	—	—	—	X	X[1]	
1.10	Paint for inner hull protection	—	X	—	—	—	X	—	
1.11	Thermal protection		X	—	—	—	X	—	Used for thermal insulation protection of weld backside
1.12	Stainless steel sheets	X	—	—	—	—	X	—	
1.13	Stainless steel studs, nuts&washers	—	X	—	—	—	X	—	Works approval is only for material approval. If C/E is provided for forged steel parts, approval is not required. C/E doesn't require approval
1.14	Collar studs(forging)	X	—	—	—	—	X	X[1]	Works approval is only for material approval. If C/E is provided for forged steel parts, approval is not required. C/E doesn't require approval
1.15	Self-locked nuts	—	X	—	—	—	X	—	
1.16	Spring washers	—	X	—	—	—	X	—	
1.17	Coupler rods,setting plates	X	—	—	—	—	X	X[1]	
1.18	Coupler base socket(forging)	X	—	—	—	—	X	X[1]	Works approval is only for material approval. If C/E is provided for forged steel parts, approval is not required. C/E doesn't require approval
1.19	Staples	—	X	—	—	—	X	—	Category 1 and 2 staples specified by the patent holder
1.20	Secondary barrier components	X	—	—	—	—	X	X[1]	Three-in-one sheet, including rigid secondary barrier and flexible secondary barrier
1.21	Fe-36% Ni alloy strips	X	—	—	—	—	X	—	
1.22	Aluminium for reinforcement elements	X	—	—	—	—	X	X[1]	
2	Prefabricated elements								

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
2.1	Insulating boxes	X	—	—	X	—	—	X[1]	
2.2	Anchor strips	X	—	—	X	—	—	X[1]	
2.3	Primary barrier components	X	—	—	X	—	—	X[1]	Include flat, corner, corner area and end stainless steel corrugated plates
2.4	Top bridge pads prefabricated elements	X	—	—	X	—	—	X[1]	
2.5	Flat wall panels prefabricated elements	X	—	—	X	—	—	X[1]	
2.6	Corner panels prefabricated elements	X	—	—	X	—	—	X[1]	
2.7	Stainless steel corners	X	—	—	X	—	—	X[1]	
2.8	Single legs prefabricated elements	X	—	—	X	—	—	X[1]	
2.9	Fe-36% Ni alloy tubes and other prefabricated components	X	—	—	—	—	—	X[1]	
Liquefied natural gas carrier cargo containment system (independent cargo Tank type C)									
3.1	Rolled steel	X	—	—	—	—	X	—	
3.2	Forgings	X	—	—	—	—	X	—	
3.3	Pipes, forgings, castings and fittings (bend, three-way, pipe nipple and tapered pipe, etc.) for natural gas piping	X	—	—	—	—	X	—	Applicable to cargo and process piping for design temperature below 0℃
3.4	End plate	X	—	—	—	—	X	X[1]	As purchased parts
3.5	Welding consumables	—	X	—	—	—	X	—	
3.6	Heat-insulating material	—	X	—	—	—	X	—	
3.7	Cargo bearer	—	X	—	—	—	X	—	
3.8	Structural adhesives	—	X	—	—	—	X	—	
3.9	Domes, fluid well	X	—	—	—	—	—	X[1]	As purchased parts
3.10	Electrical penetrations	—	X	—	X	—	—	X	Air-tight electrical penetrations for submerged pump cables
3.11	Safety valve	X	—	—	X	O	—	X	
Cargo and fuel operation system structure									
4.1	Pump tower	X	—	—	—	—	—	X[1]	For membrane cargo tank. If the shipyard has a subcontract agreement with the product factory, the product is inspected by CCS newbuilding surveyor, and C/E may not be required
4.2	Pump tower lower guiding unit (pump tower support)	X	—	—	—	—	—	X[1]	For membrane cargo tank. If the shipyard has a subcontract agreement with the product factory, the product is inspected by CCS newbuilding surveyor, and C/E may not be required
4.3	Gas dome	X	—	—	—	—	—	X[1]	For membrane cargo tank. If the shipyard has a subcontract agreement with the product factory, the product is inspected by CCS newbuilding

5.15	HD compressor	X	—	—	X	—	—	X	
5.16	LD compressor	X	—	—	X	—	—	X	
5.17	BOG compressor	X	—	—	X	—	—	X	For reliquefaction device
5.18	LNG vaporizer	X	—	X	O	O	—	X	
5.19	Forced evaporator	X	—	X	O	O	—	X	
5.20	Warming up heater	X	—	X	O	O	—	X	
5.21	Fuel gas heater	X	—	X	O	O	—	X	
5.22	Inert gas generator	X	—	—	X	O	—	X	
5.23	Nitrogen generator	X	—	—	X	—	—	X	
5.24	Nitrogen buffer tank	X	—	—	—	—	O	X	

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
5.25	Glycol water heater (steam)	X	—	X	O	O	—	X	
5.26	Electrical glycol water heater	X	—	—	—	—	—	X	
5.27	Water sprinkler and cryogenic sprinkler	—	X	—	X	—	—	X	
5.28	Gas combustion unit	X	—	—	—	—	—	X	
5.29	Gas valve unit (Gas valve train)	X	—	O	—	—	—	X	GVU, GVT
5.30	Reliquefaction device	X	—	—	O	—	—	X	Contains cryogenic device
5.31	Double walled pipe for natural gas	X	—	—	—	—	—	X	
5.32	Vacuum insulated double walled pipe	X	—	—	X	—	—	X	
5.33	Integrated gas pressure regulation	X	—	O	—	—	—	X	
5.34	Filter	X	—	—	—	—	—	X	For natural gas and liquefied natural gas pipings
Liquefied natural gas fuel supply and related systems for dual fuel ships									
6	Liquefied natural gas fuel supply system								
6.1	Vaporizer and heater skid	X	—	—	—	—	—	X	Applicable to supply in skid mode
6.2	BOG compressor skid	X	—	—	—	—	—	X	Applicable to supply in skid mode
6.3	Pressure vessel	X	—	—	—	—	X	X	Including gas buffer tank, mist separator and knock-out drum,etc.
6.4	Heat exchanger	X	—	X	O	O	—	X	Including vaporizer, heater and cooler,etc.
6.5	Fuel pump	X	—	—	X	O	—	X	Including submerged pump, deep well pump and booster pump,etc.
6.6	BOG compressor	X	—	—	X	—	—	X	
6.7	Fan	X	—	X	O	O	—	X	For double walled pipe
6.8	Cryogenic pump pool	X	—	—	—	—	—	X	Including pumps and pump pool
6.9	Emergency shut-down valve	X	—	—	X	—	—	X	
6.10	Master gas valve	X	—	—	X	—	—	X	
6.11	Tank master valve	X	—	—	X	—	—	X	
6.12	Gas valve unit (Gas valve train)	X	—	O	—	—	—	X	GVU, GVT
6.13	Integrated gas pressure regulation	X	—	O	—	—	—	X	
6.14	Tank connection space	X	—	—	—	—	—	X	
6.15	Safety valve	X	—	—	X	O	—	X	For natural gas piping and pressure vessel
7	Liquid natural gas bunkering and storage

									liquefied natural gas pipings
10.6	Flowmeter	—	X	—	X	—	—	X	For natural gas and liquefied natural gas pipings
10.7	Vent mast cap	X	—	—	—	—	—	X	
10.8	Cryogenic flange gasket	—	X	—	—	—	X	—	
10.9	Flexible hose assembly	X	—	—	X	O	—	X	For natural gas and liquefied natural gas pipings
10.10	Expansion joint and corrugated pipe	X	—	—	X	—	—	X	
10.11	Pipe insulation and external protection materials	—	X	—	—	—	X	—	
Electrical installations and automatic equipment									
11.1	Cargo switchboard	X	—	—	—	—	—	X	
11.2	Pressure control and monitoring, alarm system	X	—	—	X	O	—	X	Applicable to inert gas system
11.3	Integrated automatic system	X	—	—	X	O	—	X	Refer to the definition of CCS Rules For Construction and Equipment of ships carrying liquefied gases in bulk, "IAS" for short
11.4	Fuel tank monitoring and control system	X	—	—	X	O	—	X	
11.5	Liquefied natural gas supply electrical control system	X	—	—	X	O	—	X	Including control, alarm and safety system
11.6	Electrical control box	X	—	—	—	—	—	X	Electrical control box of the fan, water glycol pump /electric heater, water glycol emergency pump, Liquefied natural gas pump, compressor, etc
11.7	Fixed gas detection system	X	—	—	X	O	—	X	Applicable to flammable gas detection, toxic gas detection, oxygen levels detection, carbon dioxide gas detection. Including controller and detector
11.8	Ship-Shore/Ship Link-System	X	—	—	—	—	—	X	If the product is included in the Integrated Automatic System (IAS), there is no duplicate requirement to hold the certificate
11.9	Emergency shutdown system(ESD)	X	—	—	—	—	—	X	If the product is included in the Integrated Automatic System (IAS), there is no duplicate requirement to hold the certificate

Symbols:

1) C – Marine Products Certificate; E – Equivalent document; W – Manufacturer's document; X – Applicable; — – Not Applicable; O – Optional.
2) DA – Design approval; TA-B – Type approval B; TA-A – Type approval A; WA – Works approval; PA – Plan approval
3) X^1: Inspection is to be carried out according to approved integral product/system (ship, product) drawing.
4) Membrane cargo tanks mean MARK III and NO96 membrane cargo tanks with GTT patented technology.

Appendix 1E LIST OF CERTIFICATION REQUIREMENTS FOR METHANOL FUEL SYSTEM SPECIALIZED PRODUCTS

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
Independent or portable methanol tank									
1	Independent/portable tank	X	—	—	—	—	X	X	
1.1	Rolled steel	X	—	—	—	—	X	—	
1.2	Forged steel	X	—	—	—	—	X	—	
1.3	Pipes, forgings, castings and fittings (bend, three-way, pipe nipple and tapered pipe, etc.) for methanol piping	X	—	—	—	—	X	—	
1.4	End plate	X	—	—	—	—	X	X[1]	As purchased parts
1.5	Welding consumables	—	X	—	—	—	X	—	
1.6	Fluid well	X	—	—	—	—	—	X[1]	As purchased parts
1.7	Electrical penetrations	—	X	—	X	—	—	X	Air-tight electrical penetrations for submerged pump cables
1.8	Safety valve	X	—	—	X	O	—	X	
Methanol fuel supply and related systems									
2	Methanol main engine fuel supply system								
2.1	Methanol fuel supply unit	X	—	—	—	—	—	X	Applicable to supply in unit mode
2.1.1	Fuel pump	X	—	—	X	O	—	X	Including low pressure pump and high pressure pump etc.
2.1.2	Filter	X	—	—	—	—	—	X	Used for pipes of methanol fuel
2.1.3	Heat exchanger	X	—	X	O	O	—	X	
2.1.4	Electrical control box	X	—	—	—	—	—	X	
2.2	Methanol fuel valve unit	X	—	O	—	—	—	X	
2.2.1	Valve	X	—	—	X	—	—	X	
2.2.2	Filter	X	—	—	—	—	—	X	Used for pipes of methanol fuel
2.2.3	Electrical control box	X	—	—	—	—	—	X	
3	Generator set methanol fuel supply system								
3.1	Methanol low pressure pump unit	X	—	—	—	—	—	X	Applicable to supply in unit mode
3.1.1	Fuel pump	X	—	—	X	O	—	X	Low pressure pump etc.
3.1.2	Heat exchanger	X	—	X	O	O	—	X	
3.1.3	Electrical control box	X	—	—	—	—	—	X	
3.2	Methanol fuel valve unit	X	—	O	—	—	—	X	
3.2.1	Valve	X	—	—	X	—	—	X	

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
3.2.2	Filter	X	—	—	—	—	—	X	Used for pipes of methanol fuel
3.2.3	Pressure vessel	X	—	—	—	—	X	X	Including knock-out drum etc.
3.2.4	Electrical control box	X	—	—	—	—	—	X	
3.3	Methanol fuel pump unit	X	—	—	—	—	—	X	Applicable to supply in unit mode
3.3.1	Fuel pump	X	—	—	X	O	—	X	High pressure pump etc.
3.3.2	Electrical control box	X	—	—	—	—	—	X	
3.4	Seal and control oil pump unit	X	—	—	—	—	—	X	Applicable to supply in unit mode
3.4.1	Oil pump	X	—	—	X	O	—	X	Seal and control oil pump unit etc.
3.4.2	Valve	X	—	—	X	—	—	X	
3.4.3	Filter	X	—	—	—	—	—	X	
4	Methanol boiler fuel supply system								
4.1	Methanol fuel valve unit	X	—	O	—	—	—	X	
4.1.1	Valve	X	—	—	X	—	—	X	
4.1.2	Filter	X	—	—	—	—	—	X	Used for pipes of methanol fuel
4.1.3	Electrical control box	X	—	—	—	—	—	X	
4.1.4	Fuel pump								Used for methanol boiler fuel delivery
5	Methanol bunkering and storage system								
5.1	Bunkering station unit	X	—	—	—	—	—	X	Applicable to supply in unit mode
5.2	Independent/portable tank	X	—	—	—	—	X	X	For certification requirements, refer to independent or portable methanol tank
5.3	Safety valve	X	—	—	X	O	—	X	Used for methanol piping and pressure vessel
5.4	Emergency shut-down valve	X	—	—	X	—	—	X	
5.5	Hydraulic power plant	X	—	—	—	—	—	X	For driving emergency shut-down valve
6	Glycol water system								
6.1	Glycol water system unit	X	—	—	—	—	—	X	Applicable to supply in unit mode
6.2	Glycol water circulation pump	X	—	—	X	O	—	X	
6.3	Heat exchanger	X	—	X	O	O	—	X	
6.4	Glycol water balancing vessel	X	—	—	—	—	X	X	Applicable to equipment belonging to pressure vessel
6.5	Electrical control box	X	—	—	—	—	—	X	
7	Nitrogen generator and supply system								

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
7.1	Nitrogen generator unit	X	—	—	—	—	—	X	Applicable to supply in unit mode
7.2	Nitrogen generator	X	—	—	X	—	—	X	
7.3	Nitrogen tank	X	—	—	—	—	O	X	
7.4	Air compressor	X	—	X	O	O	—	X	
7.5	Electrical control box	X	—	—	—	—	—	X	
8	Piping, valve and fittings								
8.1	Valve	X	—	—	X	—	—	X	Applicable to methanol fuel piping valve
8.2	Pipes, forgings, castings and fittings (bend, three-way, pipe nipple and tapered pipe, etc.) for methanol piping	X	—	—	—	—	X	—	
8.3	Double walled pipe	X	—	—	—	—	—	X	
8.4	Filter	X	—	—	—	—	—	X	Used for pipes of methanol fuel
8.5	Flowmeter	—	X	—	X	—	—	X	Used for pipes of methanol fuel
8.6	Vent mast cap	X	—	—	—	—	—	X	
8.7	Flexible hose assembly	X	—	—	X	O	—	X	Used for pipes of methanol fuel
8.8	Expansion joint and corrugated pipe	X	—	—	X	—	—	X	
8.9	Pressure/vacuum valve	X	—	—	X	—	—	X	Used for ventilation of methanol daily tank
8.10	Fan	X	—	X	O	O	—	X	Used for ventilation of of double walled pipe
Electrical installations and automatic equipment									
9.1	Pressure control and monitoring, alarm system	X	—	—	X	O	—	X	Applicable to inert gas system
9.2	Fuel tank monitoring and control system	X	—	—	X	O	—	X	
9.3	Methanol fuel supply electrical control system	X	—	—	X	O	—	X	Including control, alarm and safety system
9.4	Fixed gas detection system	X	—	—	X	O	—	X	Applicable to flammable gas detection, toxic gas detection, oxygen levels detection, chlorine concentration gas detection, carbon dioxide gas detection. Including controller and detector
9.5	Fixed fire detection and fire alarm system	X	—	—	X	O	—	X	The system shall effectively detect methanol flame
9.6	Ship-Shore/Ship Link-System	X	—	—	—	—	—	X	If the product is included in other system , there is no duplicate requirement to hold the certificate

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
9.7	Emergency shutdown system(ESD)	X	—	—	—	—	—	X	If the product is included in other system , there is no duplicate requirement to hold the certificate

Symbols:

1) C – Marine Products Certificate; E – Equivalent document; W – Manufacturer's document; X – Applicable; — – Not Applicable; O – Optional.

2) DA – Design approval; TA-B – Type approval B; TA-A – Type approval A; WA – Works approval; PA – Plan approval

3)X^{1}: Inspection is to be carried out according to approved integral product/system (ship, product) drawing.

Appendix 1F LIST OF CERTIFICATION REQUIREMENTS FOR AMMONIA TRANSPORT AND AMMONIA FUEL SPECIALIZED PRODUCTS

No.	Product name	Document		Approval mode				Document	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
Ammonia carrier cargo containment system (membrane cargo tank)									
1	Materials/Component								
1.1	Adhesive	—	X	—	—	—	X	—	Used for bonding insulation materials and components
1.2	Glass wool	—	X	—	—	—	X	—	
1.3	Glass cloth	—	X	—	—	—	X	—	
1.4	load bearing mastic	—	X	—	—	—	X	—	
1.5	Reinforced polyurethane foam	X	—	—	—	—	X	—	
1.6	Plywood	X	—	—	—	—	X	—	
1.7	Paint for inner hull protection	—	X	—	—	—	X	—	
1.8	Thermal protection		X	—	—	—	X	—	Used for thermal insulation protection of weld backside
1.9	Stainless steel sheets	X	—	—	—	—	X	—	
1.10	Stainless steel studs, nuts& washers	—	X	—	—	—	X	—	Works approval is only for material approval. If C/E is provided for forged steel parts, approval is not required.
1.11	Secondary barrier components	X	—	—	—	—	X	X1	Three-in-one sheet, including rigid secondary barrier and flexible secondary barrier.
1.12	Aluminium for reinforcement elements	X	—	—	—	—	X	X1	
2	Prefabricated elements								
2.1	Anchor strips	X	—	—	X	—	—	X1	
2.2	Primary barrier components	X	—	—	X	—	—	X1	Include flat, corner, corner area and end stainless steel corrugated plates.
2.3	Top bridge pads prefabricated elements	X	—	—	X	—	—	X1	
2.4	Flat wall panels prefabricated elements	X	—	—	X	—	—	X1	
2.5	Corner panels prefabricated elements	X	—	—	X	—	—	X1	
2.6	Stainless steel corners	X	—	—	X	—	—	X1	
2.7	Single legs prefabricated elements	X	—	—	X	—	—	X1	
Ammonia carrier cargo containment system (independent cargo Tank type A)									
3.1	Cargo containment material	X	—	—	—	—	X	—	Such as carbon manganese steel, aluminum alloy, stainless steel etc.
3.2	Welding consumables	—	X	—	—	—	X	—	
3.3	Bearer	—	X	—	—	—	X	—	
3.4	Epoxy resin	—	X	—	—	—	X	—	
3.5	Foam board	X	—	—	—	—	X	—	Such as polyurethane material

No.	Product name	Document		Approval mode				Document	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
3.6	Insulating structure	—	X	—	X	O	—	X1	
3.7	Dome seals	—	X	—	—	—	X	—	
3.8	Rupture discs	—	X	—	X	O	—	X	
3.9	Domes, fluid well	X	—	—	—	—	—	X1	As purchased parts
3.10	Electrical penetrations	—	X	—	X	—	—	X	Airtight electrical penetrations for submersible pump cables
3.11	Safety valve	X	—	—	X	O	—	X	
Ammonia carrier cargo containment system (independent cargo Tank type B)									
4.1	Cargo containment material	X	—	—	—	—	X	—	Such as carbon manganese steel, aluminum alloy, stainless steel etc.
4.2	Welding consumables	—	X	—	—	—	X	—	
4.3	Bearer	—	X	—	—	—	X	—	
4.4	Epoxy resin	—	X	—	—	—	X	—	
4.5	Insulating material	—	X	—	—	—	X	—	
4.6	Foam board	X	—	—	—	—	X	—	Such as polystyrene foam
4.7	platen	X	—	—	—	—	X	X1	
4.8	Adhesive strips	—	X	—	—	—	X	—	
4.9	Insulating structure	—	X	—	X	O	—	X1	
4.10	Dome seals	—	X	—	—	—	X	—	
4.11	Rupture discs	—	X	—	X	O	—	X	
4.12	Domes, fluid well	X	—	—	—	—	—	X1	As purchased parts
4.13	Electrical penetrations	—	X	—	X	—	—	X	Airtight electrical penetrations for submersible pump cables
4.14	Safety valve	X	—	—	X	O	—	X	
Ammonia carrier cargo containment system (independent cargo Tank type C)									
5.1	Rolled steel	X	—	—	—	—	X	—	
5.2	Forgings	X	—	—	—	—	X	—	
5.3	Pipes, forgings, castings and fittings(bend, three-way, pipe nipple and tapered pipe, etc.) for ammonia piping	X	—	—	—	—	X	—	Applicable to cargo and process piping for design temperature below 0℃
5.4	Heads	X	—	—	—	—	X	X1	As purchased parts
5.5	Welding consumables	—	X	—	—	—	X	—	
5.6	Insulating material	—	X	—	—	—	X	—	
5.7	Bearer	—	X	—	—	—	X	—	
5.8	Structural adhesives	—	X	—	—	—	X	—	
5.9	Domes, fluid well	X	—	—	—	—	—	X1	As purchased parts
5.10	Electrical penetrations	—	X	—	X	—	—	X	Airtight electrical penetrations for submersible pump cables
5.11	Safety valve	X	—	—	X	O	—	X	
Cargo and fuel operation system structure									
6.1	Pump tower	X	—	—	—	—	—	X1	For membrane cargo tank. If the shipyard has a subcontract agreement with the product factory, the product is inspected by CCS newbuilding surveyor, and C/E may not be required

No.	Product name	Document		Approval mode				Document	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
6.2	Pump tower lower guiding unit (pump tower support)	X	—	—	—	—	—	X1	For membrane cargo tank. If the shipyard has a subcontract agreement with the product factory, the product is inspected by CCS newbuilding surveyor, and C/E may not be required
6.3	Gas dome	X	—	—	—	—	—	X1	For membrane cargo tank. If the shipyard has a subcontract agreement with the product factory, the product is inspected by CCS newbuilding surveyor, and C/E may not be required
6.4	Vent mast	X	—	—	—	—	—	X1	Fire net or safety cover at vent mast
Cargo operation system and cargo as fuel supply system of ammonia carrier									
7.1	Cargo pump	X	—	—	X	O	—	X	
7.2	Stripping/spray pump	X	—	—	X	O	—	X	
7.3	Fuel pump	X	—	—	X	O	—	X	
7.4	Emergency pump	X	—	—	X	O	—	X	
7.5	Vacuum pump for barrier	X	—	—	X	O	—	X	
7.6	Flexible hose assembly	X	—	—	X	O	—	X	For reliquefaction device, nitrogen purging, Shielding layer space clean, Cargo lightening, etc.
7.7	Cargo pipe insulation and external protection materials	—	X	—	—	—	X	—	
7.8	Valve	X	—	—	X	—	—	X	Applicable to valves for ammonia
7.9	Safety valve	X	—	—	X	—	—	X	
7.10	High velocity valve	X	—	—	X	O	—	X	
7.11	Pipes, forgings, castings and fittings (bend, three-way, pipe nipple and tapered pipe, etc.) for ammonia piping	X	—	—	—	—	X	—	Applicable to cargo and process piping for design temperature below 0℃
7.12	Flowmeter	—	X	—	X	—	—	X	Applicable to valves for ammonia
7.13	Expansion joint	X	—	—	X	—	—	X	
7.14	Flange gasket	—	X	—	—	—	X	—	Applicable to valves for ammonia
7.15	HD compressor	X	—	—	X	—	—	X	
7.16	Ammonia fuel compressor	X	—	—	X	—	—	X	
7.17	BOG compressor	X	—	—	X	—	—	X	For reliquefaction device
7.18	Ammonia evaporator	X	—	X	O	O	—	X	
7.19	Forced evaporator	X	—	X	O	O	—	X	
7.20	Warming up heater	X	—	X	O	O	—	X	

No.	Product name	Document		Approval mode				Document	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
7.21	Ammonia heater	X	—	X	O	O	—	X	
7.22	Ammonia buffer tank	X	—	—	—	—	X	X	
7.23	Ammonia treatment plant	X	—	—	—	—	—	X	
7.24	Inert gas generator	X	—	—	X	O	—	X	
7.25	Nitrogen generator	X	—	—	X	—	—	X	
7.26	Nitrogen buffer tank	X	—	—	—	—	O	X	
7.27	Glycol water heater (steam)	X	—	X	O	O	—	X	
7.28	Electrical glycol water heater	X	—	—	—	—	—	X	
7.29	Water sprinkler and cooling sprinkler	—	X	—	X	—	—	X	
7.30	Gas combustion unit	X	—	—	—	—	—	X	
7.31	Gas valve unit	X	—	O	—	—	—	X	Gas valve unit，Gas valve train
7.32	Reliquefaction device	X	—	—	O	—	—	X	Contains cryogenic device
7.33	Double walled pipe for ammonia	X	—	—	—	—	—	X	
7.34	Vacuum insulated double walled pipe	X	—	—	X	—	—	X	
7.35	Integrated gas pressure regulation	X	—	O	—	—	—	X	
7.36	Filter	X	—	—	—	—	—	X	Applicable to valves for ammonia
Ammonia fuel supply and related systems for dual fuel ships									
8	Ammonia fuel supply system								
8.1	Vaporizer and heater skid	X	—	—	—	—	—	X	Applicable to supply in skid mode
8.2	Ammonia treatment unit	X	—	—	—	—	—	X	
8.3	Ammonia fuel supply system skid	X	—	—	—	—	—	X	Applicable to supply in skid mode
8.4	Pressure vessel	X	—	—	—	—	X	X	Including buffer tank, mist separator and knock-out drum, etc.
8.5	Heat exchanger	X	—	X	O	O	—	X	Including vaporizer, heater and cooler, etc.
8.6	Fuel pump	X	—	—	X	O	—	X	Including submerged pump, deep well pump and booster pump, etc.
8.7	BOG compressor	X	—	—	X	—	—	X	
8.8	Fan	X	—	X	O	O	—	X	For double walled pipe
8.9	Ammonia fuel pump pool	X	—	—	—	—	—	X	Including pumps and pump pool
8.10	Emergency shut-down valve	X	—	—	X	—	—	X	
8.11	Master ammonia	X	—	—	X	—	—	X	

No.	Product name	Document		Approval mode				Document	Remark

	valve								
8.12	Tank master valve	X	—	—	X	—	—	X	
8.13	Gas valve unit	X	—	O	—	—	—	X	Gas valve unit, Gas valve train
8.14	Integrated gas pressure regulation	X	—	O	—	—	—	X	
8.15	Tank connection space	X	—	—	—	—	—	X	
8.16	Safety valve	X	—	—	X	O	—	X	For ammonia piping and pressure vessel
9	Ammonia bunkering and storage system								
9.1	Bunkering station skid	X	—	—	—	—	—	X	Applicable to supply in skid mode
9.2	Type A,B,C independent tanks	X	—	—	—	—	X	X	See ammonia carrier cargo containment system independent cargo Tank type A,B, C for certification requirements
9.3	Membrane tanks	—	—	—	—	—	—	X	See ammonia carrier cargo containment system membrane tanks for certification requirements
9.4	Safety valve	X	—	—	X	O	—	X	For ammonia piping and pressure vessel
9.5	Emergency shut-down valve	X	—	—	X	—	—	X	
9.6	Hydraulic power plant	X	—	—	—	—	—	X	For driving emergency shut-down valve
10	Glycol water heater system								
10.1	Glycol water heater skid	X	—	—	—	—	—	X	Applicable to supply in skid mode
10.2	Glycol water pump	X	—	—	X	O	—	X	
10.3	Glycol water heat exchanger	X	—	X	O	O	—	X	
10.4	Electrical glycol water heater	X	—	—	—	—	—	X	
10.5	Glycol water balancing vessel	X	—	—	—	—	X	X	Applicable to equipment belonging to pressure vessel
11	Nitrogen generator and supply system								
11.1	Nitrogen generator skid	X	—	—	—	—	—	X	Applicable to supply in skid mode
11.2	Nitrogen generator	X	—	—	X	—	—	X	
11.3	Nitrogen tank	X	—	—	—	—	O	X	
11.4	Air compressor	X	—	X	O	O	—	X	
12	Piping, valve and fittings								
12.1	Valve	X	—	—	X	—	—	X	Applicable to valves for ammonia
12.2	Pipes, forgings,	X	—	—	—	—	X	—	Applicable to fuel and

No.	Product name	Document		Approval mode				Document	Remark

	castings and fittings (bend, three-way, pipe nipple and tapered pipe, etc.) for ammonia piping								process piping for design temperature below 0℃
12.3	Double walled pipe for ammonia	X	—	—	—	—	—	X	
12.4	Vacuum insulated double walled pipe	X	—	—	X	—	—	X	
12.5	Filter	X	—	—	—	—	—	X	For ammonia piping
12.6	Flowmeter	—	X	—	X	—	—	X	For ammonia piping
12.7	Vent mast	X	—	—	—	—	—	X	
12.8	Flange gasket	—	X	—	—	—	X	—	For ammonia piping
12.9	Flexible hose assembly	X	—	—	X	O	—	X	For ammonia piping
12.10	Expansion joint and corrugated pipe	X	—	—	X	—	—	X	
12.11	Pipe insulation and external protection materials	—	X	—	—	—	X	—	
12.12	Ammonia Slip Catalyst (ASC)	X	—	—	X	O	—	X	Used for ammonia slip treatment; this requirement also applies to equipment using other technologies to reduce ammonia slip
Electrical installations and automatic equipment									
13.1	Cargo switchboard	X	—	—	—	—	—	X	
13.2	Pressure control and monitoring, alarm system	X	—	—	X	O	—	X	Applicable to inert gas system
13.3	Integrated automatic system	X	—	—	X	O	—	X	Refer to the definition of CCS Rules For Construction and Equipment of ships carrying liquefied gases in bulk, "IAS" for short
13.4	Fuel tank monitoring and control system	X	—	—	X	O	—	X	
13.5	Ammonia fuel supply electrical control system	X	—	—	X	O	—	X	Including control, alarm and safety system
13.6	Electrical control box	X	—	—	—	—	—	X	Electrical control box of the fan, water glycol pump/electric heater, water glycol emergency pump, Ammonia pump, compressor, etc.
13.7	Fixed gas detection system	X	—	—	X	O	—	X	Applicable to flammable gas detection, toxic gas detection, oxygen levels detection, carbon dioxide gas detection. Including controller and detector
13.8	Ship-Shore/Ship Link-System	X	—	—	—	—	—	X	If the product is included in the Integrated

No.	Product name	Document		Approval mode				Document	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
									Automatic System (IAS), there is no duplicate requirement to hold the certificate
13.9	Emergency shutdown system	X	—	—	—	—	—	X	If the product is included in the Integrated Automatic System (IAS), there is no duplicate requirement to hold the certificate

Symbols:

1) C – Marine Products Certificate; E – Equivalent document; W – Manufacturer's document;
X – Applicable; — – Not Applicable; O – Optional.

2) DA – Design approval; TA-B – Type approval B; TA-A – Type approval A; WA – Works approval;
PA – Plan approval

3) X1: Inspection is to be carried out according to approved integral product/system (ship, product) drawing.

4) Membrane cargo tanks mean MARK III and NO96 membrane cargo tanks with GTT patented technology.

Appendix 2A LIST OF CERTIFICATION REQUIREMENTS FOR CLASSED MARINE PRODUCT PARTS

No.	Product name	Document		Approval mode				Plan approval	Remark

Material									
1	Metal material								
1.1	Rolled steel								
1.2	Aluminum alloy								
1.3	Other non-ferrous metal material								
1.4	Steel wire rope								
2	Non-metallic material								
2.1	Resin								
2.2	Reinforcement material								
2.3	Fiber rope								
2.4	Epoxy casting material for seating								
2.5	Synthetic (bearing) material								
2.6	Heat-insulating material								
2.7	Cargo bearer								
2.8	Cargo hold supporting gaskets								
2.9	Propeller shaft coating material								
2.10	Structural adhesives								
3	Welding consumables								
3.1	Electrode								
3.2	Wire								
3.3	Flux								
4	Corrosion resistant means								
4.1	Shop primer								
4.2	Coating below ship's waterline								
4.3	Paint above ship's waterline								
4.4	Ship tank coating								
4.5	Sacrificial anode								
4.6	Cathodic protection system								
Hull									
5	Hull structure equipment								
5.1	Stem, stern post, rudder horn and propeller shaft bracket								
5.2	Hatch cover								
.1	Rolled steel	X	–	–	–	–	X	–	
5.3	Window							–	
.1	Window glass	–	X	–	–	–	X	–	
5.4	Bow, stern and gangway doors								
.1	Rolled steel	X	–	–	–	–	X	–	
.2	Hydraulic cylinder	X	–	–	–	–	–	X	
.3	Hydraulic power unit	X	–	–	–	–	–	X	
.4	Electrical control, indication and alarm box/panel	X	–	–	–	–	–	X	
5.5	Watertight door								
.1	Rolled steel	X	–	–	–	–	X	–	
.2	Hydraulic cylinder	X	–	–	–	–	–	X	
.3	Hydraulic power unit	X	–	–	–	–	–	X	
.4	Electrical control, indication and alarm	X	–	–	–	–	–	X	

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
	box/panel								
5.6	Watertight cable transits								
5.7	Portable means of access for inspections								
5.8	Container securing arrangements								
.1	Forging	–	X	–	–	–	X	–	For details, see Appendix 1, Chapter 7, PART TWO of the Rules
.2	Casting	–	X	–	–	–	X	–	For details, see Appendix 1, Chapter 7, PART TWO of the Rules
5.9	Loading computer								
6	Outfitting								
6.1	Rudder blade								
.1	Casting	X	–	–	–	–	X	X[1]	
.2	Steel plate	X	–	–	–	–	X	–	
6.2	Rudder stock and pintle								
.1	Forging	X	–	–	–	–	X	X[1]	
6.3	Rudder bearing and pin bearing								
.1	Casting	X	–	–	–	–	X	X[1]	
6.4	Rudder stock connecting bolt								
.1	Forging	X	–	–	–	–	X	X[1]	
6.5	Single point mooring arrangement								
.1	Chain stopper, bow fairlead, chafing chain and pedestal roller	X							Material is subject to inspection and certification according to rules requirements
6.6	Emergency towing arrangement								
.1	Towing pennant, chafing chain, fairlead, strong point and roller pedestal	X							Material is subject to inspection and certification according to rules requirements
6.7	Towing hook								
.1	Forging and casting	X	–	–	–	–	X	X[1]	
6.8	Towing winch								
.1	Hydraulic cylinder	X	–	–	–	–	–	X	For brake
.2	Hydraulic power unit	X	–	–	–	–	–	X	
.3	Hydraulic motor	X	–	–	–	–	–	X	
.4	Electrical control box	X	–	–	–	–	–	X	
.5	Motors (50 kW and over)	X	–	–	X	O	–	X	
.6	Motors (below 50 kW)	–	X	–	X	–	–	X	
6.9	Seats of high speed craft								
7	Anchoring and mooring equipment								
7.1	Anchor chains and fitting								
.1	Anchor chain steel bar	X	–	–	–	–	X	–	
.2	Casting/forging	X	–	–	–	–	X	–	
7.2	Anchors and accessory								
.1	Anchor head	X	–	–	–	–	X	X[1]	
.2	Anchor shank and anchor pin	X	–	–	–	–	X	X[1]	
.3	Anchor shackle	X	–	–	–	–	X	X[1]	
.4	Steel plate	X[2]	–	–	–	–	X	–	Applicable to welding anchor
7.3	Chain stopper								
.1	Casting	X[2]	–	–	–	–	X	X[1]	
.2	Forging	X[2]	–	–	–	–	X	X[1]	
.3	Steel plate	X[2]	–	–	–	–	X	–	

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
7.4	Cable clenches								
7.5	Windlass								
.1	Motors (50 kW and over)	X	–	–	X	O	–	X	
.2	Motors (below 50 kW)	–	X	–	X	–	–	X	
.3	Electrical control box	X	–	–	–	–	–	X	
.4	Master controller	X	–	–	–	–	–	X	
.5	Hydraulic cylinder	X	–	–	–	–	–	X	For brake
.6	Hydraulic power unit	X	–	–	–	–	–	X	
.7	Hydraulic motor	X	–	–	–	–	–	X	
.8	Cable lifter	X[2]	–	–	–	–	X	X[1]	
.9	Main shaft (forging)	X	–	–	–	–	X	X[1]	
.10	Main shaft (steel bar)	X[2]	–	–	–	–	–	X[1]	
.11	Transmission gearing	X	–	–	X	O	X	X[1]	Applicable to rated power of 100 kW or above
7.6	Mooring winch and capstan								If used as an alternative for windlass, see relevant requirements for windlass
.1	Motors (50 kW and over)	X	–	–	X	O	–	X	
.2	Motors (below 50 kW)	–	X	–	X	–	–	X	
.3	Hydraulic motor	X	–	–	–	–	–	X	
.4	Main shaft (forging)	X	–	–	–	–	X	X[1]	
.5	Main shaft (steel bar)	X[2]	–	–	–	–	–	X[1]	
.6	Hydraulic power unit	X	–	–	–	–	–	X	
7.7	Winch or capstan for operation								
.1	Motors (50 kW and over)	X	–	–	X	O	–	X	
.2	Motors (below 50 kW)	–	X	–	X	–	–	X	
.3	Hydraulic motor	X	–	–	–	–	–	X	
.4	Main shaft (forging)	X	–	–	–	–	X	X[1]	
.5	Main shaft (steel bar)	X[2]	–	–	–	–	–	X[1]	
.6	Hydraulic power unit	X	–	–	–	–	–	X	
Machinery (including machinery equipment of refrigerated vessels)									
8	Pumps and piping								
8.1	Bilge pump and bilge injection pump								
8.2	Ballast pump								
8.3	Liquid cargo pump, stripping pump and tank cleaning pump								
8.4	Fuel oil pump								
8.5	Fuel oil injection valve cooling pump								
8.6	Lubricating oil pump								
8.7	Fire pump (including emergency fire pump)								
8.8	Cooling water pump								
8.9	Boiler feed pump								
8.10	Boiler circulating water pump								
8.11	Hot oil circulating pump								
8.12	Condensate pump								
8.13	Pipes of more than 50 mm in diameter for piping of Classes I and II and fittings (flange, bend and three-way, etc.)								
8.14	Pipes of 50 mm in diameter and below for piping of Classes I and II and fittings (flange, bend and three-way, etc.)								

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
8.15	Pipes for piping of Class III and fittings (flange, bend and three-way, etc.)								
8.16	Valves of 50 mm in diameter and over for piping of Classes I and II, valves of 300 mm in diameter and over for piping of Class III; sea valve								
.1	Valve body	–	X	–	–	–	X	X[1]	
8.17	Valves of less than 50 mm in diameter for piping of Classes I and II								
8.18	Plastic pipe								
8.19	Flexible hose assembly, for piping of Classes I and II or more than 50 mm in diameter								
.1	Pipe end fittings	–	X	–	X	–	–	–	Pipe end fittings which are type tested along with hose assembly may not apply for a separate type approval
8.20	Flexible hose assembly: except for above-mentioned								
.1	Pipe end fittings	–	X	–	X	–	–	–	Pipe end fittings which are type tested along with hose assembly may not apply for a separate type approval
8.21	Mechanical pipe joint								
8.22	Corrugated expansion joint								
8.23	Air pipe closing appliance								
.1	Casting	–	X	–	–	–	X	–	
8.24	Spark arrester								
8.25	Sound damper								
8.26	Filter								
8.27	Fume exhaust valve								
9	Boiler and pressure vessel								
9.1	Boiler body								
.1	Steel plate	X[2]	–	–	–	–	X	–	Not applicable to heat-conducting oil furnace
.2	Steel pipe	X[2]	–	–	–	–	X	–	
.3	End plate	X	–	–	–	–	X	X[1]	Not applicable to heat-conducting oil furnace
9.2	Boiler burner								
.1	Flexible hose assembly	X	–	–	X	O	–	X	
.2	Motors (below 50 kW)	-	X	–	X	–	–	X	
.3	Electrical control box	X	–	–	–	–	–	X	
9.3	Economizer			–					
.1	Steel plate	X[2]	–	–	–	–	X	–	
.2	Steel pipe	X	–	–	–	–	X	–	
9.4	Steam generator (over 0.35 MPa)								
.1	Steel plate	X[2]	–	–	–	–	X	–	
.2	Steel pipe	X	–	–	–	–	X	–	
9.5	Thermal oil and thermal water heating units (for service of propulsion machinery)								
.1	Steel plate	X[2]	–	–	–	–	X	–	
.2	Steel pipe	X	–	–	–	–	X	–	
9.6	Safety valve								

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
9.7	Boiler liquid meter								
9.8	Classes I and II pressure vessel								
.1	Steel plate	X[2]	–	–	–	–	X	–	
.2	Steel pipe	X	–	–	–	–	X	–	
.3	End plate	X	–	–	–	–	X	X[1]	
.4	Safety valve	X	–	–	X	O	–	X	
9.9	Class III pressure vessel								
.1	Steel plate	–	X	–	–	–	X[2]	–	
.2	Steel pipe	–	X	–	–	–	X	–	
9.10	Heat exchanger								
10	Machinery equipment								
10.1	Steam turbine								
.1	Rotor	X	–	–	–	–	–	X	
.2	Impeller	X	–	–	–	–	–	X	
.3	Shaft	X	–	–	–	–	–	X	
.4	Thimble	X	–	–	–	–	–	X	The temperature of main and auxiliary steam turbine and steam turbine of inlet temperature > 250℃
.5	Blade	X	–	–	–	–	–	X	The temperature of main and auxiliary steam turbine and steam turbine of inlet temperature > 250℃
.6	Teeth coupling	X	–	–	–	–	–	X	The temperature of main and auxiliary steam turbine and steam turbine of inlet temperature > 250℃
.7	Cylinder and bolt	X	–	–	–	–	–	X	The temperature of main and auxiliary steam turbine and steam turbine of inlet temperature > 250℃
.8	Diaphragm plate	X	–	–	–	–	–	X	The temperature of main and auxiliary steam turbine and steam turbine of inlet temperature > 250℃
.9	Guide blade	X	–	–	–	–	–	X	The temperature of main and auxiliary steam turbine and steam turbine of inlet temperature > 250℃
.10	Box body	X	–	–	–	–	–	X	The temperature of main and auxiliary steam turbine and steam turbine of inlet temperature > 250℃
.11	Foundation	X	–	–	–	–	–	X	The temperature of main and auxiliary steam turbine and steam turbine of inlet temperature > 250℃

10.3.1	Diesel engine (cylinder diameter > 300 mm or single cylinder power >400 kW)								For dual fuel engines and gas fuel engines, reference is made to this paragraph for implementation
.1	Welding bedplate	X	—	—	—	—	X	X[1]	W to be provided for material properties; W to be provided for NDT
.2	Bearing seat (steel casting)	X	—	—	—	—	X	X[1]	W to be provided for material properties; W to be provided for NDT
.3	Welded frame	X	—	—	—	—	X	X[1]	W to be provided for material properties; W to be provided for NDT
.4	Cylinder block (iron casting)	—	X	—	—	—	—	X[1]	Applicable to engines with power >400kW/cyl; W to include hydraulic tests
.5	Welded cylinder block	X	—	—	—	—	X	X[1]	Applicable to crosshead engines; W to be provided for material properties; W to be provided for NDT
.6	Engine block body (iron casting)	—	X	—	—	—	X	X[1]	Applicable to engines with power >400kW/cyl; W to include mechanical properties (for ductile cast iron) and hydraulic tests
.7	Cylinder liner	—	X	—	—	—	X	X[1]	Applicable to engines with cylinder diameter >300mm ; W to include material properties and hydraulic tests
.8	Cylinder cover(iron casting)	—	X	—	—	—	X	X[1]	Applicable to engines with cylinder diameter >300mm; W to include hydraulic tests
.9	Cylinder cover(steel casting, forging)	X	—	—	—	—	X	X[1]	Applicable to engines with cylinder diameter >300mm; W to be provided for material properties; W to be provided for NDT and hydraulic tests
.10	Piston crown	X	—	—	—	—	X	X[1]	Applicable to engines with cylinder diameter >400mm; W to be provided for material properties; W to be provided for NDT
.11	Crankshaft	X	—	—	—	—	X	X[1]	C/E to be provided for material properties; W to be provided for NDT; W to be provided for scantling inspection (including surface condition)
.12	Crank, Main shaft journal (forging) and shaft journal with flange	X	—	—	—	—	X	X[1]	Applicable to structure-semi-integrated crankshaft; C/E to be provided for material properties; W to be provided for NDT; W to be provided for scantling inspection

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
									(including surface condition)
.13	Exhaust valve casing	—	X	—	—	—	—	X[1]	Applicable to crosshead engines; W to include hydraulic test;
.14	Piston rod	X	—	—	—	—	X	X[1]	W Applicable to crosshead engines with cylinder diameter >400mm; C/E to be provided for material properties; W to be provided for NDT
.15	Crosshead	X	—	—	—	—	X	X[1]	Applicable to crosshead engines; C/E to be provided for material properties; W to be provided for NDT
.16	Connecting rod (including bearing cover)	X	—	—	—	—	X	X[1]	C/E to be provided for material properties; W to be provided for NDT; W to be provided for scantling inspection (including surface condition)
.17	Crankshaft connecting bolt (semi-built crankshaft)	X	—	—	—	—	X	X[1]	C/E to be provided for material properties; W to be provided for NDT; W to be provided for scantling inspection (including surface condition)
.18	Main bearing bolt	—	X	—	—	—	X	X[1]	Applicable to engines with cylinder diameter >300mm ; W to include material properties and NDT
.19	Cylinder cover bolt	—	X	—	—	—	X	X[1]	Applicable to engines with cylinder diameter >300mm ; W to include material properties and NDT
.20	Connecting rod upper/ lower bolt	—	X	—	—	—	X	X[1]	Applicable to engines with cylinder diameter >300mm; W to include material properties and NDT
.21	Tie rod	X	—	—	—	—	X	X[1]	Applicable to crosshead engines; W to be provided for material properties; W to be provided for NDT; test report to be provided for scantling inspection (including surface condition)
.22	High pressure fuel injection pump	—	X	—	—	—	—	X	W to include material properties and hydraulic test (manufacturer with cylinder diameter ≤ 300mm may submit hydraulic test report)
.23	High pressure fuel injection valve	—	X	—	—	—	—	X	W to include hydraulic test (manufacturer with cylinder diameter ≤ 300mm may submit hydraulic test report)
.24	High pressure fuel injection pipe (including fuel common rail)	—	X	—	X	—	—	X	W to include material properties and hydraulic test (manufacturer with cylinder diameter ≤ 300mm may submit hydraulic test report)
.25	High pressure servo oil pipe (including common rail pipe)	—	X	—	X	—	—	X	W to include material properties and hydraulic test (manufacturer with cylinder

									Appendix 1A
.7	Actuator	O	X	–	X[3]	–	–	X	For emergency maneuvering, or as valve actuator, located in the ballast tank, can not be locally maneuvered
14.6	Dynamic positioning control system								
.1	Computer	–	X	–	X[3]	–	–	X	
.2	Display	–	X	–	X[3]	–	–	X	
.3	Uninterrupted Power Supply (UPS)	–	X	–	X[3]	–	–	X	
.4	Position reference system	–	X	–	X[3]	–	–	X	
.5	Vertical surface reference system	–	X	–	X[3]	–	–	X	
.6	Gyrocompass	–	X	–	X[3]	–	–	X	
.7	Wind velocity and direction gauge	–	X	–	X[3]	–	–	X	
.8	Programmable controller	–	X	–	X	–	–	X	
14.7	EOM system computer	–	X	–	X	–	–	X	Applicable to hardware, type approval is not necessary to two equipped computers which are standby each other. For ships applying for EOM notation
14.8	Shaft power meter	–	X	–	X	O	–	X	For ships applying for EOM notation
14.9	Flowmeter	–	X	–	X	O	–	X	For ships applying for EOM notation

Symbols:
1) C – Marine Products Certificate; E – Equivalent document; W – Manufacturer's document; X – Applicable; O – Optional;
2) DA – Design approval; TA-B – Type approval B; TA-A – Type approval A; WA – Works approval; PA – Plan approval;
3) X[1]: Inspection is to be carried out according to approved integral product/system (ship, product) drawing;
4) X[2]: If certification requirements for purchased parts can not be satisfied, inspection is to be carried out according to the requirements of CCS rules;
5) X[3]: If certification requirements for purchased parts can not be satisfied, complete type test is to be carried out with integral product;
6) X[4]: may be accepted subject to special agreement of CCS.

General requirements:
1) Aluminum alloy plate, section, rivet and piston for manufacturing equipment are to meet relevant inspection requirements in Chapter 8, PART ONE of CCS Rules for Materials and Welding.
2) In the Table, if parts with type approval requirements are manufactured by the equipment manufacturer and only for products manufactured by the manufacturer, and product approval process can cover those parts, those parts may be deemed as being approved by CCS. There is no need to issue individual approval certificate for those parts. If parts with product certificate requirements are manufactured by the equipment manufacturer and only for products manufactured by the manufacturer, inspection is to be carried out according to CCS requirements, and there is no need to issue individual product certificate.
3) If parts requiring individual plan approval have been approved in equipment drawing, plan approval need not be carried out again.
4) Material and parts only needing manufacturer's certification are not detailed in the Table, for details, see the Guidelines.
5) WA in the Table means works approval by material manufacturer.

Appendix 2B LIST OF CERTIFICATION REQUIREMENTS FOR STATUTORY MARINE PRODUCT PARTS

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
1	Life-saving appliances								
1.1	Lifebuoy								
.1	Retroreflective material	–	X	–	X	–	–	X	
1.2	Position-indicating lamp for life-saving appliances								
1.3	Spontaneous distress flare of lifebuoy								
1.4	Lifejacket								
.1	Retroreflective material	–	X	–	X	–	–	X	
1.5	Immersion suit, anti-exposure suit								
.1	Retroreflective material	–	X	–	X	–	–	X	
1.6	Thermal protective aid								
1.7	Visual signal								
1.8	Line-throwing appliance								
1.9	Life rafts								
.1	Main body adhesive cloth	–	X	–	X	–	–	–	Manufactured by life raft plant approved by CCS and with glue-making capability, TA to be provided with W
.2	Raft case	X	–	–	X	O	–	–	
.3	Radar reflector	–	X	–	X	–	–	X	May be replaced by radar responder
.4	Raft light	–	X	–	X	–	–	X	
.5	Thermal protective aid	–	X	–	X	–	–	X	
.6	Life-saving provisions	–	X	–	X	–	–	–	
.7	Manual reverse osmosis sea water desalination device	–	X	–	X	–	–	X	
.8	Free floating equipment (static pressure relief device)	X	–	–	X	O	–	X	
.9	Relieving gear	X	–	–	X	O	–	X	
.10	Retroreflective material	–	X	–	X	–	–	X	
.11	Rocket parachute flare	–	X	–	X	–	–	X	
.12	Hand flare	–	X	–	X	–	–	X	
.13	Buoyant smoke signal	–	X	–	X	–	–	X	
.14	Inflatable life-saving appliance charging system	–	X	–	X	–	–	X	
.15	Charging steel bottle	X	–	–	–	–	X	X	
1.10	Life boats								
.1	Lifeboat engine group	X	–	–	X	O	–	X	
.2	Air bottle	X	–	–	–	–	X	X	
.3	Lifeboat radar reflector	–	X	–	X	–	–	X	May be replaced by radar responder
.4	Searchlight for lifeboat	–	X	–	X	–	–	X	
.5	Compass for lifeboat	–	X	–	X	–	–	X	
.6	Retroreflective material	–	X	–	X	–	–	X	
.7	Battery	–	X	–	X	–	–	X	
.8	Relieving gear	X	-	–	X	O	–	X	
.9	Portable fire-extinguisher	–	X	–	X	–	–	X	
.10	Thermal protective aid	–	X	–	X	–	–	X	
.11	Resin	–	X	–	–	–	X	–	
.12	Fiber-reinforced material for hull structure	–	X	–	–	–	X	–	
.13	Rocket parachute flare	–	X	–	X	–	–	X	
.14	Hand flare	–	X	–	X	–	–	X	
.15	Buoyant smoke signal	–	X	–	X	–	–	X	
.16	Life-saving provisions	–	X	–	X	–	–	–	
.17	Manual reverse osmosis sea water desalination device	–	X	–	X	–	–	X

.18	Position-indicating lights for life boats	–	X	–	X	–	–	X	
1.11	Rescue boats								
.1	Rescue boat engine group	X	–	–	X	O	–	X	
.2	Rescue boat radar reflector	–	X	–	X	–	–	X	
.3	Searchlight for rescue boat	–	X	–	X	–	–	X	
.4	Compass for rescue boat	–	X	–	X	–	–	X	
.5	Retroreflective material	–	X	–	X	–	–	X	
.6	Battery	–	X	–	X	–	–	X	
.7	Relieving gear	X	–	–	X	O	–	X	
.8	Portable fire-extinguisher	–	X	–	X	–	–	X	
.9	Thermal protective aid	–	X	–	X	–	–	X	
.10	Resin	–	X	–	–	–	X	–	
.11	Fiber-reinforced material for hull structure	–	X	–	–	–	X	–	
.12	Watertight VHF radio communication equipment	X	–	–	X	O	–	X	
.13	Position-indicating lights for rescue boats	–	X	–	X	–	–	X	
1.12	Lowering apparatus								
.1	Boat davit	X	–	–	X	O	–	X[1]	
.2	Wire rope	X	–	–	–	–	X	–	
.3	Moving parts	X	–	–	–	–	X	X[1]	Refer to paragraph 1.2.1(5), Chapter 1 of Rules for Lifting Appliances of Ships and Offshore Installations
.4	Lifting hook	X	–	–	X	O	–	X[1]	Material is to be purchased from approved factory
.5	Release hook	X	–	–	X	O	–	X[1]	
.6	Winch	X	–	–	X	O	–	X[1]	
.7	Hydraulic cylinder	X	–	–	–	–	–	X[1]	
.8	Hydraulic power unit	X	–	–	–	–	–	X[1]	
.9	Accumulator	X	–	–	–	–	X	X	
.10	Motors (50 kW and over)	X	–	–	X	O	–	X	
.11	Motors (below 50 kW)	–	X	–	X	–	–	X	
.12	Electrical control box	X	–	–	–	–	–	X[1]	The first product is to be subject to type test
1.13	Marine evacuation system								
.1	Main body adhesive cloth	–	X	–	X	–	–	–	Refer to requirements for life raft
.2	Vessel	X	–	–	X	O	–	–	
.3	Free floating equipment (static pressure relief device)	X	–	–	X	O	–	X	
.4	Charging steel bottle	X	–	–	–	–	X	X	
1.14	Rescue equipment for person falling into water								
1.15	Embarkation ladder								
1.16	Public address system								
1.17	General emergency alarm system								
2	Pollution prevention at sea								
2.1	Oil-filtering equipment								
.1	Pump	X	–	–	X	O	–	–	
.2	Motors (below 50 kW)	–	X	–	X	–	–	X	
.3	Electrical control box	X	–	–	–	–	–	X	The first product is to be subject to type test
.4	15 ppm alarm	X	–	–	X	O	–	X	
2.2	Oil/water interface detector								
2.3	Existing oil-filtering equipment (additional treatment equipment in resolution MEPC.60(33)) (oil content of effluent not								

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
	exceeding 15 ppm)								
2.4	Oil discharge monitoring and control system								
.1	Electrical control box	X	–	–	–	–	–	X	The first product is to be subject to type test
.2	Oil content meter	X	–	–	X	O	–	X	
2.5	Sewage treatment plant								
.1	Pump (discharge pump, disintegrating pump, circulating pump and air pump)	X	–	–	X	O	–	X	
.2	Motors (below 50 kW)	–	X	–	X	–	–	X	
.4	Electrical control box	X	–	–	–	–	–	X	The first product is to be subject to type test
2.6	Incinerator								
.1	Motors (below 50 kW)	–	X	–	X	–	–	X	
.2	Fan	X	–	–	–	–	–	X	
.3	Electrical control box	X	–	–	–	–	–	X	The first product is to be subject to type test
2.7	Nitrogen oxide analyzer (chemical luminescent detector (CLD) type/ heating chemical luminescent detector (HCLD) type)								
2.8	Exhaust cleaning system(scheme A)								Exhaust pipe, induced-draft fan/blower, pump, valve, piping, motor, electrical control box etc. used for the system are to be certified in accordance with the requirements of appendix 1A. Water treatment system is to be certified by referring to 10.3.4 of Appendix 2A
2.8.1	Scrubber	X	–	–	–	–	–	X	
2.9	Exhaust cleaning system(scheme B)								Exhaust pipe, induced-draft fan/blower, pump, valve, piping, motor, electrical control box etc. used for the system are to be certified in accordance with the requirements of appendix 1A. Water treatment system is to be certified by referring to 10.3.4 of Appendix 2A
2.9.1	Scrubber	X	–	–	–	–	–	X	
2.10	Equipment reducing NO_x emission on board by other equivalent method								
2.10.1	Selective catalysis reducing system (SCR)	X	–	–	X	O	–	X	A system with reductant using urea solution
.1	SCR reactor installation	X	–	–	–	–	–	X[1]	
.2	Electronic control system	X	–	–	X	–	–	X	
.3	Valve	X	–	–	X	O	–	X	Valve of nominal diameter not less than 300 mm
.4	Motors (50 kW and over)	X	–	–	X	O	–	X	
.5	Motors (below 50 kW)	–	X	–	X	O	–	X	
.6	Flexible hose assembly, for piping of Classes I and II or more than 50 mm in nominal diameter	X	–	–	X	O	–	X	
.7	Flexible hose assembly: except for above-mentioned	–	X	–	X	–	–	X	
.8	Plastic pipe	–	X	–	–	–	X	–	Applicable to the pipes

No.	Product name	Document		Approval mode				Plan approval	Remark

									mentioned in Appendix 1 of Chapter 2, PART THREE of the Rules
2.11	Equipment limiting SO_x emission by other technology								
2.12	NO_x emission of diesel engines of over 130 kW								
2.13	Ballast water management system								
.1	Ballast pump	X	–	–	X	O	–	X	
.2	Motors (50 kW and over)	X	–	–	X	O	–	X	
.3	Motors (below 50 kW)	–	X	–	X	–	–	X	
.4	Valve	X	–	–	X	O	–	X	Valve of diameter not less than 300 mm
.5	Electrical control box	X	–	–	–	–	–	X	The first product is to be subject to type test
2.14	Crude oil washing machine								
2.15	Comminuting and disinfecting system								
3	Fire-resisting material, structure and fire- fighting equipment								
3.1	Deck covering								
3.2	Non-combustible material								
3.3	Low flame spread material								
3.4	Vertical-mounted textile and film								
3.5	Soft cushion furniture								
3.6	Bedding								
3.7	Classes A, B and F fire division								
3.8	Class A fire window/side scuttle								
.1	Fireproof glass	–	X	–	–	–	X	–	
.2	Non-combustible material	–	X	–	–	–	X	–	
3.9	Class A and class B division penetrations								
3.10	Fire door								
.1	Non-combustible material	–	X	–	–	–	X	–	
.2	Low flame spread material	–	X	–	–	–	X	–	
.3	Door lock	–	X	–	X	–	–	X	
.4	Fireproof glass	–	X	–	–	–	X	–	
3.11	Fire door control device								
.1	Flexible hose assembly	–	X	–	X	–	–	X	
.2	Electrical control box	X	–	–	–	–	–	X	
3.12	Fire damper								
3.13	Flame-retarding material for furniture on high speed craft								
3.14	Flame-retarding material for high speed craft								
3.15	Fire division of high speed craft								
3.16	Fire division penetration of high speed craft								
3.17	Flame arrester								
3.18	Pressure vacuum valve								
3.19	Bulkhead gearing								
3.20	Fixed gas fire- extinguishing arrangement (CO_2)								
.1	Cylinder	X	–	–	–	–	X	X	
.2	Afflux pipe	–	X	–	–	–	X	–	
.3	Bottle head valve, selection valve (release valve)	X	–	–	X	O	–	X	

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA	
.4	Flexible hose assembly	–	X	–	X	–	–	X	
3.21	Fixed equivalent gas fire-extinguishing arrangement								
.1	Cylinder	X	–	–	–	–	X	X	
.2	Afflux pipe	–	X	–	–	–	X	–	
.3	Bottle head valve, selection valve (release valve)	X	–	–	X	O	–	X	
.4	Flexible hose assembly	–	X	–	X	–	–	X	Where applicable
3.22	Equivalent gas fire-extinguishing arrangement (aerosol system)								
3.23	Fixed local water-based fire-extinguishing arrangement								
.1	Injector head	X	–	–	X	–	–	X	
.2	Water pump	X	–	–	X	O	–	X	
.3	Motors (below 50 kW)	–	X	–	X	–	–	X	
.4	Electrical control box	X	–	–	–	–	–	X	The first product is to be subject to type test
3.24	Fixed water-based fire-extinguishing arrangement (equivalent to IMO resolution A.123(V))								
.1	Injector head	X	–	–	X	–	–	X	
.2	Water pump	X	–	–	X	O	–	X	
.3	Motors (50 kW and over)	X	–	–	X	O	–	X	
.4	Motors (below 50 kW)	–	X	–	X	–	–	X	
.5	Electrical control box	X	–	–	–	–	–	X	The first product is to be subject to type test
3.25	High-expansion foam fire-extinguishing arrangement								
.1	High-expansion foam fire-extinguishing medium	–	X	–	–	–	X	–	
.2	Foam generator	X	–	–	X	O	–	X	
.3	Proportion mixer	X	–	–	–	–	–	X	
3.26	Fixed medium-expansion foam fire-extinguishing arrangement								
.1	Medium-expansion foam fire-extinguishing medium	–	X	–	–	–	X	–	
.2	Foam storage tank	X	–	–	–	–	X	X	
.3	Proportion mixer	X	–	–	–	–	–	X	
.4	Foam applicator, foam monitor	X	–	–	X	O	–	X	
3.27	Fixed low-expansion foam fire-extinguishing arrangement								
.1	Low-expansion foam fire-extinguishing medium	–	X	–	–	–	X	–	
.2	Foam storage tank	X	–	–	–	–	X	X	
.3	Proportion mixer	X	–	–	–	–	–	X	
.4	Foam applicator, foam monitor	X	–	–	X	O	–	X	
3.28	Foam fire-extinguishing medium								
3.29	Chemical dry powder fire-extinguishing arrangement								
.1	Dry powder applicator/monitor	X	–	–	X	O	–	X	
.2	Dry powder storage tank	X	–	–	–	–	X	X	
3.30	Fixed pressure water spray								

No.	Product name	Document		Approval mode				Plan approval	Remark

Symbols:
1) C – Marine Products Certificate; E – Equivalent document; W – Manufacturer's document; X – Applicable; O – Optional;
2) DA – Design approval; TA-B – Type approval B; TA-A – Type approval A; WA – Works approval; PA – Plan approval;
3) X^1: Inspection is to be carried out according to approved integral product/system (ship, product) drawing.

General requirements:
1) Aluminum alloy plate, section, rivet and piston for manufacturing equipment are to meet relevant inspection requirements in Chapter 8, PART ONE of CCS Rules for Materials and Welding.
2) In the Table, if parts with type approval requirements are manufactured by the equipment manufacturer and only for products manufactured by the manufacturer, and product approval process can cover those parts, those parts may be deemed as being approved by CCS. There is no need to issue individual approval certificate for those parts. If parts with product certificate requirements are manufactured by the equipment manufacturer and only for products manufactured by the manufacturer, inspection is to be carried out according to CCS requirements, and there is no need to issue individual product certificate.
3) If parts requiring individual plan approval have been approved in equipment drawing, plan approval need not be carried out again.
4) Material and parts only needing manufacturer's certification are not detailed in the Table, for details, see the Guidelines.
5) WA in the Table means works approval by material manufacturer.

Appendix 2C LIST OF CERTIFICATION REQUIREMENTS FOR LIFTING APPLIANCE PARTS

No.	Product name	Document		Approval mode				Plan approval	Remark
		C/E	W	DA	TA-B	TA-A	WA	PA

5.1	Lift for passenger or crew								
.1	Safety clamp	–	X	X	–	–	–	X[1]	
.2	Speed-limiting device	–	X	X	–	–	–	X[1]	
.3	Wire rope and rigging	–	X	-	–	–	–	X[1]	
.4	Buffer	–	X	X	–	–	–	X[1]	
.5	Electrical control system	X	–	–	–	–	–	X[1]	The first product is to be subject to type test
.6	Actuating device	–	X	X	–	–	–	X[1]	Including winch and brake
.7	Door lock	–	X	X	–	–	–	X[1]	
.8	Motor	–	X	–	X	–	–	X[1]	
5.2	Cargo and vehicle lift and vehicle ramp								
.1	Electrical control box	X	–	–	–	–	–	X	
.2	Hydraulic cylinder	X	–	–	–	–	–	X	
.3	Hydraulic power unit	X	–	–	–	–	–	X	For certification requirements for motors, refer to Appendix 2A
6	Telescope gangway								
6.1	Main structure								
.1	Aluminium alloy	X	–	–	–	–	X	–	
6.2	Telescopic and amplitude-changing rotary mechanism								
.1	Motors (50 kW and over)	X	–	–	X	O	–	X	
.2	Motors (below 50 kW)	–	X	–	X	–	–	X	
.3	Gear	X	–	–	–	–	X	X[1]	C/E to be provided for forging material
.4	Rack	X	–	–	–	–	–	X	
.5	Guide	X	–	–	–	–	–	X	
.6	Brake	X	–	O	O	–	–	X	
.7	Luffing cylinder	X	–	–	–	–	–	X[1]	
.8	Reduction gearbox	X	–	×	–	–	–	X	
.9	Rotating support	X	–	–	X	O	–	X[1]	C/E to be provided for forging material
.10	Hydraulic motor	X[2]	–	–	–	–	–	X	
6.3	Hydraulic power unit								
.1	Flexible hose assembly, for piping of Classes I and II or more than 50 mm in diameter	X	–	–	X	O	–	X	
.2	Flexible hose assembly: except for above-mentioned	–	X	–	X	–	–	X	
.3	Hydraulic pump	X	–	–	X	O	–	X	
.4	Accumulator	O	X	–	–	–	X	X	<0.7 MPa & 0.1 ~ 0.25 m^3, WA to be provided for W, ≥ 0.7 MPa or ≥ 0.25 m^3, C/E to be provided
.5	Motors (50 kW and over)	X	–	–	X	O	–	X	
.6	Motors (below 50 kW)	–	X	–	X	–	–	X	
.7	Electrical control box	X	–	–	–	–	–	X	
6.4	Winch (where applicable)								
.1	Winch	X	–	–	–	–	–	X	

Symbols:
1) C – Marine Products Certificate; E – Equivalent document; W – Manufacturer's document; X – Applicable; O – Optional;

2) DA – Design approval; TA-B – Type approval B; TA-A – Type approval A; WA – Works approval; PA – Plan approval;
3) X^1: Inspection is to be carried out according to approved integral product/system (ship, product) drawing;
4) X^2: If certification requirements for purchased parts can not be satisfied, inspection is to be carried out according to the requirements of CCS rules.

General requirements:

1) Aluminum alloy plate, section, rivet and piston for manufacturing equipment are to meet relevant inspection requirements in Chapter 8, PART ONE of CCS Rules for Materials and Welding.
2) In the Table, if parts with type approval requirements are manufactured by the equipment manufacturer and only for products manufactured by the manufacturer, and product approval process can cover those parts, those parts may be deemed as being approved by CCS. There is no need to issue individual approval certificate for those parts. If parts with product certificate requirements are manufactured by the equipment manufacturer and only for products manufactured by the manufacturer, inspection is to be carried out according to CCS requirements, and there is no need to issue individual product certificate.
3) If parts requiring individual plan approval have been approved in equipment drawing, plan approval need not be carried out again.
4) Material and parts only needing manufacturer's certification are not detailed in the Table, for details, see the Guidelines.
5) WA in the Table means works approval by material manufacturer.

CHAPTER 4 SURVEYS DURING CONSTRUCTION①

Section 1 GENERAL PROVISIONS

4.1.1 Application for survey

4.1.1.1 When applying for surveys by CCS during construction of a ship, the applicant is to submit a written application to the Headquarters or a local unit of CCS, prior to the commencement of construction.

4.1.2 Assessment of shipyard

4.1.2.1 When a shipyard for the first time applies for building a ship to be classed with CCS or a novel ship to be classed with CCS, the Surveyor is to assess the production capacity of the shipyard, covering locations and facilities of production, quality assurance system, competence of building personnel in general and subcontractors, and to assess the fitness and effectiveness of the ship to be built.

4.1.3 Examination prior to commencement of construction

4.1.3.1 Prior to the commencement of construction, the Surveyor is to examine and confirm the preparations of the shipyard for construction and surveys, e.g. plan of preparations for construction, building/welding procedure, qualifications of welders/NDT personnel, list of certification requirements for marine products, welding specifications, NDT diagrams, tightness testing diagrams, list of survey/test items, relevant materials (including steel plates, welding consumables), manufacturing tolerance standards, subcontractors (if applicable) and technical documents required before the commencement of construction, such as drawings. Individual items, which will not affect the commencement of construction, may be examined and confirmed before an appropriate stage of construction at the discretion of the Surveyor.

4.1.4 Check of other test/survey documents

4.1.4.1 The Surveyor is to review or confirm the relevant documents provided by the shipyard in preparations for building the ship, such as documents of installing procedures of machinery, equipment and systems (excluding reasonable alignment of shafting), documents and programmes for on-site inclining test, mooring test and sea trial, etc.

4.1.4.2 The Surveyor is to confirm that the measurement and test equipment used for safety systems, etc., is furnished with valid certificates, and that both the operators of such equipment and company personnel on whose service results the surveys are based have recognized qualification certificates or qualification certificates approved by or acceptable to CCS.

Section 2 SURVEYS AND TESTS

4.2.1 General requirements

4.2.1.1 The Surveyor is to carry out surveys according to approved plans (including comments) and confirm the actions taken by the shipyard to implement the plans, and feed different opinions of the shipyard on the implementation of approved plans and associated comments back to the plan approval department in time.

4.2.1.2 The shipyard is to prepare, as required by the rules, lists of certified products for the ship intended to be built, according to Appendices 1A, 1B, 1C, 1D, 1E and 1F of Chapter 3 of this PART and submit them to the attending Surveyor for confirmation.

4.2.1.3 For ships engaged on international voyages and contracted for construction on or after 1 January 2008, the hull survey during construction is additionally to be in accordance with the requirements in Appendix 1 of this Chapter.

4.2.1.4 New installation of materials containing asbestos is to be prohibited for all ships as from 1 January 2011.

4.2.1.5 For newly constructed dual class ships, the scope of survey is to be in accordance with the bilateral agreement adopted by the two Societies or the trilateral agreement adopted by the two Societies and the shipyard.

---

① The requirements for initial classification surveys of ships under construction are given in 5.14.2 of Section 14 of Chapter 5.

4.2.1.6 Unless otherwise specified, the survey of all watertight cable transits installed on all ships contracted for construction on or after 1 July 2024 is to comply with the requirements of Appendix 3 of this Chapter.

4.2.2 Survey and test items

4.2.2.1 Hull survey and test items

(1) The Surveyor is to confirm that hull structural materials (metals, castings, forgings, welding consumables and nonmetallic materials), mooring and anchoring equipment and systems are furnished with the certificates or documents required by the rules.

(2) The Surveyor is to inspect the hull structure and equipment to ensure that the materials, scantlings, construction, arrangement and installation are in accordance with the approved plans, diagrams, specifications, calculations and other technical documentation and that the workmanship is in all respects satisfactory.

(3) Where any scantling, material or poor material, building work, arrangement, procedure, device or equipment is found to not comply with the approved plans, diagrams, specifications or calculations, the Surveyor is to require rectification thereof.

(4) For the purpose of construction survey, the Surveyor is to control and inspect main stages, inspect scantlings, and inspect welding quality and welding specifications of erection.

(5) Compartment structures are to be inspected to confirm integrity of hull structure. Construction monitoring is to be conducted for critical structural areas.

(6) Compartment bulkheads, including transverse and longitudinal ones, are to be subject to structural test, or leak test or hose test or an alternative test.

(7) Inspection and test of hatches and openings together with their closing means, including operation test of remote controls.

(8) Inspection and test of fire protection, extinction and detection arrangements and their installation.

(9) Inspection and test of steering gear, anchoring and mooring equipment after installation, for which the testing of the main steering gear and rudder stock and that of the auxiliary steering gear are to respectively comply with the requirements of 13.1.5.2 and those of 13.1.5.3 of PART THREE of the Rules.

(10) Determination of rudder centreline, propulsion shafting centerline.

(11) Determination of ship’s main dimensions, load line marks, draft scale and other marks.

(12) Lightweight survey.

(13) Inclining test, including inspection of ship’s condition before testing and assessment after testing, is to be attended.

(14) Inspection and test of items related to class notations, including confirming that the materials, equipment, devices and systems as required by the rules are in accordance with the approved plans, calculations and other technical documentation, that they are furnished with the certificates required by the rules and that the workmanship is in all respects satisfactory.

(15) Mooring tests and sea trials are to be attended.

4.2.2.2 Machinery survey and test items

(1) The Surveyor is to confirm that the machineries, equipment, devices and systems as required by the rules are all furnished with the products certificates or documents required by the rules.

(2) The Surveyor is to inspect the machineries, equipment, devices and systems to ensure that their arrangement, installation and workmanship are in all respects in accordance with the approved plans, diagrams, specifications, calculations and other technical documentation.

(3) Inspection and test of manufacturing and installation of piping, including strength test in workshop and tightness test after installation on board the ship are to be attended.

(4) Inspection and performance test of machineries, equipment, devices and systems after installation, such as main engines, propulsion shafting, propeller, gear boxes, generating sets, boilers, pressure vessels, steering gear, windlasses, air compressors, heat exchangers, sea chests, scupper valves, etc.

(5) Performance test of pump and pipe systems, such as those of fuel oil, lubricating oil, cooling, heating, bilge, ballasting, fire fighting, ventilating, measuring, venting, cargo oil, cleaning, inert gas.

(6) Inspection and performance test of control or remote control systems of main and auxiliary engines and other auxiliary machinery and devices after installation.

(7) Inspection and performance test of remotely controlled means of closing, such as emergency closing means of fuel oil tanks, closing of ventilation systems and openings and after their installation.

(8) Inspection and performance test of equipment, devices and systems required by class notations after installation.

(9) Mooring tests and sea trials are to be attended.

(10) The arrangement of fire pumps and fire mains are to be inspected and separate operation of each fire

pump (including emergency fire pumps) is to be checked for ensuring necessary pressure for fire mains in any place of the ship.
(11) Inspection of fixed fire-extinguishing systems, special arrangement of machinery and boiler spaces, mechanical ventilation and exhaust fans, and operation of remotely controlled stop devices.
4.2.2.3 Survey and test items for electrical installations
(1) The Surveyor is to confirm that the electrical installations and systems as required by the rules are all furnished with the products certificates or documents required by the rules.
(2) The Surveyor is to inspect the electrical installations such as generators, motors, cables, main and emergency switchboards to ensure that their arrangement, installation and workmanship are in all respects in accordance with the approved plans, diagrams, specifications, calculations and other technical documentation.
(3) Inspection and test of the electrical installations such as generators, motors, cables, main and emergency switchboards after installation.
(4) Inspection and test of steering systems including emergency steering system.
(5) Inspection and test of internal communication systems and alarm systems on board.
(6) Inspection and test of the electrical installations after installation within dangerous zones (if any).
(7) Inspection and test of emergency power supply including temporary emergency power supply.
(8) Inspection and test of equipment, devices and systems required by class notations after installation, such as mechanical automatic control systems and remote control systems — control of main and auxiliary engines, other auxiliary machinery and boilers, inspection and performance test of safety and alarm systems and dynamic positioning systems.
(9) Mooring tests and sea trials are to be attended.

4.2.3 The requirements for tests
4.2.3.1 The tightness tests of compartments are to be in accordance with the relevant requirements in Section 3 of this Chapter.
4.2.3.2 Tightness test for machineries, boilers, pressure vessels and piping is to be carried out after installation. The duration of test is in general to be not less than 5 min, with the test pressure as required in PART THREE of the Rules.
4.2.3.3 Inclining test
(1) When construction is finished, each ship is to undergo an inclining test to determine the elements of its stability, and the information thereon is to be provided to the master of the ship, which will enable him to promptly assess with ease the stability of his ship in different service conditions. The conditions and requirements for the inclining test and the assessment of test results are to comply with the relevant provisions of IMO or the requirements of the flag State Administration (if any).
(2) CCS may allow the inclining test of an individual cargo ship to be dispensed with, provided basic stability data are available from the inclining test of a sister ship and it is shown to the satisfaction of the Administration that reliable stability information for the exempted ship can be obtained from such basic data. The ship is to be inclined whenever, in comparison with the data derived from the sister ship, a deviation from the lightship displacement exceeding 1% for ships of 160 m or more in length and 2% for ships of 50 m or less in length and as determined by linear interpolation for intermediate lengths or a deviation from the lightship longitudinal centre of gravity exceeding 0.5% of L is found.
Note: Length of the ship (L) is the length as defined in Reg.3 of the Load Line Convention.

(3) CCS may allow the inclining test of an individual ship or class of ships especially designed for the carriage of liquids or ore in bulk to be dispensed with, subject to agreement by the flag State Administration, when reference to existing data for similar ships clearly indicates that, due to the ship's proportions and arrangements, more than sufficient metacentric height will be available in all probable loading conditions.

Section 3 TESTING PROCEDURES OF WATERTIGHT COMPARTMENTS

4.3.1 General requirements
4.3.1.1 The testing procedures of watertight compartments are to be carried out in accordance with Annex 1 of this Section, the "Procedures for Testing Tanks and Tight Boundaries", which are composed of Part A, Part B and Part C as follows:
Part A — SOLAS Ships (including CSR BC & OT)

Part B — SOLAS Exempt/Equivalent Ships
Part C — Non-SOLAS Ships

4.3.1.2 Testing procedures of watertight compartments for SOLAS Ships (including CSR BC & OT) are to be carried out in accordance with Part A, unless:

(1) the shipyard provides documentary evidence of the shipowner's agreement to a request to the flag Administration for an exemption from the application of SOLAS Reg. II-1/11, or for an equivalency agreeing that the content of Part B is equivalent to SOLAS Reg. II-1/11; and

(2) the above-mentioned exemption/equivalency has been granted by the responsible flag Administration.

4.3.1.3 Testing procedures of watertight compartments are to be carried out in accordance with Part B for those SOLAS ships (including CSR BC & OT) for which:

(1) the shipyard provides documentary evidence of the shipowner's agreement to a request to the flag Administration for an exemption from the application of SOLAS Reg. II-1/11, or for an equivalency agreeing that the content of Part B is equivalent to SOLAS Reg. II-1/11; and

(2) the above-mentioned exemption/equivalency has been granted by the responsible flag Administration.

4.3.1.4 Testing procedures of watertight compartments are to be carried out in accordance with PART C for non-SOLAS ships, see SOLAS Chapter I, Regulation 1 and Regulation 3.

Annex 1
Procedures for Testing Tanks and Tight Boundaries
Part A - SOLAS Ships①

1 General

1.1 These test procedures are to confirm the watertightness of tanks,watertight boundaries and the structural adequacy of tanks which form part of the watertight subdivisions② of ships. These procedures may also be applied to verify the weathertightness of structures and shipboard outfitting. The tightness of all tanks and watertight boundaries of ships during new construction and those relevant to major conversions or major repairs③ is to be confirmed by these test procedures prior to the delivery of the ship.

1.2 Testing procedures of watertight compartments for SOLAS Ships (including CSR BC & OT) are to be carried out in accordance with Part A, unless:

(1) the shipyard provides documentary evidence of the shipowner's agreement to a request to the flag Administration for an exemption from the application of SOLAS Reg. II-1/11, or for an equivalency agreeing that the content of Part B is equivalent to SOLAS Reg. II-1/11; and

(2) the above-mentioned exemption/equivalency has been granted by the responsible flag Administration.

2 Application

2.1 All gravity tanks④ and other boundaries required to be watertight or weathertight are to be tested in accordance with this Procedure and proven to be tight and structurally adequate as follows:

(1) gravity tanks for their tightness and structural adequacy;

(2) watertight boundaries other than tank boundaries for their watertightness; and

(3) weathertight boundaries for their weathertightness.

2.2 The testing of cargo containment systems of liquefied gas carriers is to be in accordance with the testing requirements in 4.21 to 4.26 of the IGC Code and standards deemed appropriate by CCS.

2.3 The testing of structures not listed in Table 1 or Table 2 is to be specially considered.

3 Test Types and Definitions

3.1 The following two types of tests are specified in this requirement:

(1) Structural Test:

A test to verify the structural adequacy of tank construction. This may be a hydrostatic test or, where the situation warrants, a hydropneumatic test.

(2) Leak Test:

A test to verify the tightness of a boundary. Unless a specific test is indicated, this may be a hydrostatic/hydropneumatic test or an air test. A hose test may be considered an acceptable form of leak test

---

① Ships to which the SOLAS Convention is applicable.

② Watertight subdivision means the transverse and longitudinal subdivisions of the ship required to satisfy the subdivision requirements of SOLAS Chapter II-1.

③ Major repair means a repair affecting structural integrity.

④ Gravity tank means a tank that is subject to vapour pressure not greater than 70 kPa.

for certain boundaries, as indicated by Footnote 3 of Table 1.

3.2 The definition of each test type is as follows:

Hydrostatic Test: (Leak and Structural)	A test wherein a space is filled with a liquid to a specified head.
Hydropneumatic Test: (Leak and Structural)	A test combining a hydrostatic test and an air test, wherein a space is partially filled with a liquid and pressurized with air.
Hose Test: (Leak)	A test to verify the tightness of a joint by a jet of water with the joint visible from the opposite side.
Air Test: (Leak)	A test to verify tightness by means of air pressure differential and leak indicating solution. It includes tank air test and joint air tests, such as compressed air fillet weld tests and vacuum box tests.
Compressed Air Fillet Weld Test: (Leak)	An air test of fillet welded tee joints wherein leak indicating solution is applied on fillet welds.
Vacuum Box Test: (Leak)	A box over a joint with leak indicating solution applied on the welds. A vacuum is created inside the box to detect any leaks.
Ultrasonic Test: (Leak)	A test to verify the tightness of the sealing of closing devices such as hatch covers by means of ultrasonic detection techniques.
Penetration Test: (Leak)	A test to verify that no visual dye penetrant indications of potential continuous leakages exist in the boundaries of a compartment by means of low surface tension liquids (i.e. dye penetrant test).

3.3 The 'top of the overflow' is defined as being the top of any overflow system which is used to prevent overfilling of a tank. Such system can be an overflow pipe, airpipe, intermediate tank. For gravity tanks (i.e. sewage, grey water and similar tanks, not filled with pumps) the top of the overflow is to be taken as the highest point of the filling line.

Note: Gauging devices are not considered equivalent to an overflow system with the exception of fuel oil overflow tanks not intended to hold fuel which have been fitted with a level alarm.

Where a tank is fitted with multiple means of preventing overfilling, the decision on which overflow system is to be used to determine the test head is to be based on the highest point to which the liquid may rise in service.

4 Test Procedures

4.1 General

Tests are to be carried out in the presence of a Surveyor at a stage sufficiently close to the completion of work with all hatches, doors, windows, etc. installed and all penetrations including pipe connections fitted, and before any ceiling and cement work is applied over the joints. Specific test requirements are given in 4.4 and Table 1. For the timing of the application of coating and the provision of safe access to joints, see 4.5, 4.6 and Table 3.

4.2 Structural test procedures

4.2.1 Type and time of test

Where a structural test is specified in Table 1 or Table 2, a hydrostatic test in accordance with 4.4.1 will be acceptable. Where practical limitations (strength of building berth, light density of liquid, etc.) prevent the performance of a hydrostatic test, a hydropneumatic test in accordance with 4.4.2 may be accepted instead.

A hydrostatic test or hydropneumatic test for the confirmation of structural adequacy may be carried out while the vessel is afloat, provided the results of a leak test are confirmed to be satisfactory before the vessel is afloat.

Alternative equivalent tank testing procedures may be considered for tanks which are constructed from composite materials such as glass reinforced plastic (GRP) and fibre reinforced plastic (FRP) based on the recommendations of the composite manufacturer.

4.2.2 Testing schedule for new construction or major structural conversion

4.2.2.1 Tanks which are intended to hold liquids, and which form part of the watertight subdivision of the ship①, shall be tested for tightness and structural strength as indicated in Table 1 and Table 2.

4.2.2.2 The tank boundaries are to be tested from at least one side. The tanks for structural test are to be selected so that all representative structural members are tested for the expected tension and compression.

4.2.2.3 The watertight boundaries of spaces other than tanks for structural testing may be exempted, provided that the water-tightness of boundaries of exempted spaces is verified by leak tests and inspections. Structural testing may not be exempted and the requirements for structural testing of tanks in 4.2.2.1 to 4.2.2.2 shall apply, for ballast holds, chain lockers and a representative cargo hold if intended for in-port ballasting.

4.2.2.4 Tanks which do not form part of the watertight subdivision of the ship[①], may be exempted from structural testing provided that the water-tightness of boundaries of exempted spaces is verified by leak tests and inspections.

4.3 Leak test procedures

(1) For the leak tests specified in Table 1, tank air tests, compressed air fillet weld tests, vacuum box tests in accordance with 4.4.4 through 4.4.6, or their combination, will be acceptable. Hydrostatic or hydropneumatic tests may also be accepted as leak tests provided that 4.5, 4.6 and 4.7 are complied with. Hose tests will also be acceptable for such locations as specified in Table 1, Footnote 3, in accordance with 4.4.3.

(2) The application of the leak test for each type of welded joint is specified in Table 3.

(3) Air tests of joints may be carried out in the block stage provided that all work on the block that may affect the tightness of a joint is completed before the test. See also 4.5.1 for the application of final coatings and 4.6 for the safe access to joints and the summary in Table 3.

4.4 Test methods

4.4.1 Hydrostatic test

(1) Unless another liquid is approved, hydrostatic tests are to consist of filling the space with fresh water or sea water, whichever is appropriate for testing, to the level specified in Table 1 or Table 2. See also 4.7.

(2) In cases where a tank is designed for cargo densities greater than sea water and testing is with fresh water or sea water, the testing pressure height is to simulate the actual loading for those greater cargo densities as far as practicable, but the test pressure shall not exceed the maximum design internal pressure at the top of tank.

(3) All external surfaces of the tested space are to be examined for structural distortion, bulging and buckling, other related damage and leaks.

4.4.2 Hydropneumatic test

(1) Hydropneumatic tests, where approved, are to be such that the test condition, in conjunction with the approved liquid level and supplemental air pressure, will simulate the actual loading as far as practicable. The requirements and recommendations for tank air tests in 4.4.4 will also apply to hydropneumatic tests. See also 4.7.

(2) All external surfaces of the tested space are to be examined for structural distortion, bulging and buckling, other related damage and leaks.

4.4.3 Hose test

(1) Hose tests are to be carried out with the pressure in the hose nozzle maintained at least at $2 \cdot 10^5$ Pa during the test. The nozzle is to have a minimum inside diameter of 12 mm and be at a perpendicular distance from the joint not exceeding 1.5 m. The water jet is to impinge directly upon the weld.

(2) Where a hose test is not practical because of possible damage to machinery, electrical equipment insulation or outfitting items, it may be replaced by a careful visual examination of welded connections, supported where necessary by means such as a dye penetrant test or ultrasonic leak test or the equivalent.

4.4.4 Tank air test

(1) All boundary welds, erection joints and penetrations, including pipe connections, are to be examined in accordance with approved procedure and under a stabilized pressure differential above atmospheric pressure not less than $0.15 \cdot 10^5$ Pa, with a leak indicating solution such as soapy water/detergent or a proprietary brand applied.

(2) A U-tube with a height sufficient to hold a head of water corresponding to the required test pressure is to be arranged. The cross sectional area of the U-tube is not to be less than that of the pipe supplying air to the tank.

(3) Arrangements involving the use of two calibrated pressure gauges to verify the required test pressure may be accepted taking into account the provisions in F5.1 and F7.4 of IACS Rec. 140, “Recommendation for Safe Precautions during Survey and Testing of Pressurized Systems”.

(4) A double inspection is to be made of tested welds. The first is to be immediately upon applying the leak indication solution; the second is to be after approximately four or five minutes in order to detect those smaller leaks which may take time to appear.

4.4.5 Compressed air fillet weld test

(1) In this air test, compressed air is injected from one end of a fillet welded joint and the pressure verified at the other end of the joint by a pressure gauge. Pressure gauges are to be arranged so that an air pressure

---

① Watertight subdivision means the main transverse and longitudinal subdivisions of the ship required to satisfy the subdivision requirements of SOLAS Chapter II-1.

of at least $0.15 \cdot 10^5$ Pa can be verified at each end of all passages within the portion being tested.
Note: Where a leak test is required for fabrication involving partial penetration welds, a compressed air test is also to be applied in the same manner as to fillet weld where the root face is large, i.e., 6-8 mm.

4.4.6 Vacuum box test

(1) A box (vacuum testing box) with air connections, gauges and an inspection window is placed over the joint with a leak indicating solution applied to the weld cap vicinity. The air within the box is removed by an ejector to create a vacuum of $0.20 \cdot 10^5 – 0.26 \cdot 10^5$ Pa inside the box.

4.4.7 Ultrasonic test

(1) An ultrasonic echo transmitter is to be arranged inside of a compartment and a receiver is to be arranged on the outside. The watertight/weathertight boundaries of the compartment are scanned with the receiver in order to detect an ultrasonic leak indication. A location where sound is detectable by the receiver indicates a leakage in the sealing of the compartment.

4.4.8 Penetration test

(1) A test of butt welds or other weld joints uses the application of a low surface tension liquid at one side of a compartment boundary or structural arrangement. If no liquid is detected on the opposite sides of the boundaries after the expiration of a defined period of time, this indicates tightness of the boundaries. In certain cases, a developer solution may be painted or sprayed on the other side of the weld to aid leak detection.

4.4.9 Other test

(1) Other methods of testing may be considered by CCS upon submission of full particulars prior to the commencement of testing.

4.5 Application of coating

4.5.1 Final coating

(1) For butt joints welded by an automatic process, the final coating may be applied any time before the completion of a leak test of spaces bounded by the joints, provided that the welds have been carefully inspected visually to the satisfaction of the Surveyor.
(2) Surveyors reserve the right to require a leak test prior to the application of final coating over automatic erection butt welds.
(3) For all other joints, the final coating is to be applied after the completion of the leak test of the joint. See also Table 3.

4.5.2 Temporary coating

(1) Any temporary coating which may conceal defects or leaks is to be applied at the time as specified for the final coating (see 4.5.1). This requirement does not apply to shop primer.

4.6 Safe access to joints

For leak tests, safe access to all joints under examination is to be provided. See also Table 3.

4.7 Hydrostatic or hydropneumatic tightness test

In cases where the hydrostatic or hydropneumatic tests are applied instead of a specific leak test, examined boundaries must be dew-free, otherwise small leaks are not visible.

Test Requirements for Tanks and Boundaries **Table 1**

	Tank or boundary to be tested	Test type	Test head or pressure	Remark
1	Double bottom tanks[4]	Leak and structural[1]	The greater of - top of the overflow[10], - to 2.4 m above top of tank[2], or - to bulkhead deck	
2	Double bottom voids[5]	Leak	See 4.4.4 through 4.4.6, as applicable	including pump room double bottom and bunker tank protection double hull required by MARPOL Annex I
3	Double side tanks	Leak and structural[1]	The greater of - top of the overflow[10], - to 2.4 m above top of tank[2], or - to bulkhead deck	
4	Double side voids	Leak	See 4.4.4 through 4.4.6, as applicable	

	Tank or boundary to be tested	Test type	Test head or pressure	Remark
5	Deep tanks other than those listed elsewhere in this table	Leak and structural[1]	The greater of - top of the overflow[10], or - to 2.4 m above top of tank[2]	
6	Cargo oil tanks	Leak and structural[1]	The greater of - top of the overflow[10], - to 2.4m above top of tank[2], or - to top of tank[2] plus the design vapour pressure	
7	Ballast hold of bulk carriers	Leak and structural[1]	Top of cargo hatch coaming	
8	Peak tanks	Leak and structural[1]	The greater of - top of the overflow[10], or - to 2.4 m above top of tank[2]	After peak to be tested after installation of stern tube
9	.1 Fore peak spaces with equipment	Leak	See 4.4.3 through 4.4.6, as applicable	
	.2 Fore peak voids	Leak	See 4.4.4 through 4.4.6, as applicable	
	.3 Aft peak spaces with equipment	Leak	See 4.4.3 through 4.4.6, as applicable	
	.4 Aft peak voids	Leak	See 4.4.4 through 4.4.6, as applicable	After peak to be tested after installation of stern tube
10	Cofferdams	Leak	See 4.4.4 through 4.4.6, as applicable	
11	.1 Watertight bulkheads	Leak[8]	See 4.4.3 through 4.4.6, as applicable[7]	
	.2 Superstructure end bulkheads	Leak	See 4.4.3 through 4.4.6, as applicable	
12	Watertight doors below freeboard or bulkhead deck	Leak[6, 7]	See 4.4.3 through 4.4.6, as applicable	
13	Double plate rudder blades	Leak	See 4.4.4 through 4.4.6, as applicable	
14	Shaft tunnels clear of deep tanks	Leak[3]	See 4.4.3 through 4.4.6, as applicable	
15	Shell doors	Leak[3]	See 4.4.3 through 4.4.6, as applicable	
16	Weathertight hatch covers and closing appliances	Leak[3, 7]	See 4.4.3 through 4.4.6, as applicable	Hatch covers closed by tarpaulins and battens excluded
17	Dual purpose tanks/dry cargo hatch covers	Leak[3, 7]	See 4.4.3 through 4.4.6, as applicable	In addition to structural test in item 6 or 7
18	Chain lockers	Leak and structural[1]	Top of chain pipe	
19	L.O. sump. tanks and other similar tanks/spaces under main engines	Leak[9]	See 4.4.3 through 4.4.6, as applicable	
20	Ballast ducts	Leak and structural[1]	The greater of - ballast pump maximum pressure, or - setting of any pressure relief valve	
21	Fuel Oil Tanks	Leak and structural[1]	The greater of - top of the overflow[10], - to 2.4m above top of tank[2], or - to top of tank[2] plus the design vapour pressure, or - to bulkhead deck	
22	Fuel oil overflow tanks not intended to hold fuel	Leak and structural[1]	The greater of - top of the overflow[10], - to 2.4m above top of tank[2], or - to bulkhead deck	

Notes:
1 Refer to section 4.2.2.
2 The top of a tank is the deck forming the top of the tank, excluding any hatchways.
3 Hose Test may also be considered as a medium of the test. See 3.2.
4 Including tanks arranged in accordance with the provisions of SOLAS regulation II-1/9.4.
5 Including duct keels and dry compartments arranged in accordance with the provisions of SOLAS regulation II-1/11.2 and II-1/9.4 respectively, and/or oil fuel tank protection and pump room bottom protection arranged in accordance with the

provisions of MARPOL Annex I, Chapter 3, Part A regulation 12A and Chapter 4, Part A, regulation 22 respectively.
6 Where water tightness of a watertight door has not been confirmed by prototype test, testing by filling watertight spaces with water is to be carried out. See SOLAS regulation II-1/16.2 and MSC/Circ.1572/Rev.1.
7 As an alternative to the hose testing, other testing methods listed in 4.4.7 through 4.4.9 may be applicable subject to adequacy of such testing methods being verified. See SOLAS regulation II-1/11.1. For watertight bulkheads (item 11.1) alternatives to the hose testing may only be used where a hose test is not practicable.
8 A "Leak and structural test", see 4.2.2 is to be carried out for a representative cargo hold if intended for in-port ballasting. The filling level requirement for testing cargo holds intended for in-port ballasting is to be the maximum loading that will occur in-port as indicated in the loading manual.
9 Where L.O. sump tanks and other similar spaces under main engines intended to hold liquid form part of the watertight subdivision of the ship, they are to be tested as per the requirements of Item 5, Deep tanks other than those listed elsewhere in this table.
10 Refer to section 3.3.

Additional Test Requirements for Special Service Ships/Tanks **Table 2**

	Type of Ship/Tank	Structures to be tested	Type of Test	Test Head or Pressure	Remark
1	Liquefied gas carriers	Integral tanks	Leak and structural	Refer to Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk	
		Hull structure supporting membrane or semi-membrane tanks	Refer to Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk	Refer to Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk	
		Independent tanks type A	Refer to Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk	Refer to Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk	
		Independent tanks type B	Refer to Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk	Refer to Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk	
		Independent tanks type C	Refer to Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk	Refer to Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk	
2	Edible liquid tanks	Independent tanks	Leak and structural[1]	The greater of - top of the overflow[3], or - to 0.9 m above top of tank[2]	
3	Chemical carriers	Integral or independent cargo tanks	Leak and structural[1]	The greater of - to 2.4 m above top of tank[2], or - to top of tank[2] plus the design vapour pressure	Where a cargo tank is designed for the carriage of cargoes with specific gravities larger than 1.0, see section 4.4.1

Notes:
1 Refer to section 4.2.2.
2 Top of tank is deck forming the top of the tank excluding any hatchways.
3 Refer to section 3.3.

Application of Leak Test, Coating and Provision of Safe Access for Type of Welded Joints
Table 3

Type of welded joints		Leak test	Coating[1]		Safe Access[2]	
			Before leak test	After leak test but before structural test	Leak test	Structural test
Butt	Automatic	Not required	Allowed[3]	N/A	Not required	Not required
	Manual or Semi-automatic[4]	Required	Not allowed	Allowed	Required	Not required
Fillet	Boundary including	Required	Not allowed	Allowed	Required	Not required

	penetrations					

Notes:
1 Coating refers to internal (tank/hold coating), where applied, and external (shell/deck) painting. It does not refer to shop primer.
2 Temporary means of access for verification of the leak test.
3 The condition applies provided that the welds have been carefully inspected visually to the satisfaction of the Surveyor.
4 Flux Core Arc Welding (FCAW) semiautomatic butt welds need not be tested provided that careful visual inspections show continuous uniform weld profile shape, free from repairs, and the results of NDE testing show no significant defects.

Part B - SOLAS Exempt/Equivalent Ships

1 General

1.1 These test procedures are to confirm the watertightness of tanks, watertight boundaries and the structural adequacy of tanks which form part of the watertight subdivisions① of ships. These procedures may also be applied to verify the weathertightness of structures and shipboard outfitting. The tightness of all tanks and watertight boundaries of ships during new construction and those relevant to major conversions or major repairs② is to be confirmed by these test procedures prior to the delivery of the ship.

1.2 Testing procedures of watertight compartments are to be carried out in accordance with Part B for those SOLAS ships (including CSR BC & OT) for which:

(1) the shipyard provides documentary evidence of the shipowner's agreement to a request to the flag Administration for an exemption from the application of SOLAS Reg. II-1/11, or for an equivalency agreeing that the content of Part B is equivalent to SOLAS Reg. II-1/11; and

(2) the above-mentioned exemption/equivalency has been granted by the responsible flag Administration.

2 Application

2.1 Testing procedures are to be carried out in accordance with the requirements of Part A in association with the following alternative procedures for 4.2.2 "Testing schedule for new construction or major structural conversion" of Part A .

2.2 The tank boundaries are to be tested from at least one side. The tanks for structural test are to be selected so that all representative structural members are tested for the expected tension and compression.

2.3 Structural tests are to be carried out for at least one tank of a group of tanks having structural similarity (i.e. same design conditions, alike structural configurations with only minor localised differences determined to be acceptable by the attending Surveyor) on each vessel provided all other tanks are tested for leaks by an air test. The acceptance of leak testing using an air test instead of a structural test does not apply to cargo space boundaries adjacent to other compartments in tankers and combination carriers or to the boundaries of tanks for segregated cargoes or pollutant cargoes in other types of ships.

2.4 Additional tanks may require structural testing if found necessary after the structural testing of the first tank.

2.5 For tanks which are less than 2 m^3 in volume, structural testing may be replaced by leak testing.

2.6 Where the structural adequacy of the tanks and spaces of a vessel were verified by the structural testing required by either PART A or PART B 2.3, subsequent vessels in the series (i.e. sister ships built from the same plans at the same shipyard) may be exempted from structural testing of tanks, provided that:

(1) water-tightness of boundaries of all tanks and spaces are verified by leak tests and thorough inspections are carried out;

(2) structural testing is carried out for at least one tank or space of each type among all tanks/spaces of each sister vessel;

(3) additional tanks and spaces may require structural testing if found necessary after the structural testing of the first tank or if deemed necessary by the attending Surveyor.

For cargo space boundaries adjacent to other compartments in tankers and combination carriers or boundaries of tanks for segregated cargoes or pollutant cargoes in other types of ships, structural tests are to be carried out for at least one tank of a group of tanks having structural similarity (i.e. same design conditions, alike structural configurations with only minor localised differences determined to be acceptable by the attending Surveyor) on each vessel provided all other tanks are tested for leaks by an air test.

2.7 Sister ships built (i.e. keel laid) two years or more after the delivery of the last ship of the series, may be tested in accordance with Part B 2.6 at the discretion of CCS, provided that:

---

① Watertight subdivision means the main transverse and longitudinal subdivisions of the ship required to satisfy the subdivision requirements of SOLAS Chapter II-1.

② Major repair means a repair affecting structural integrity.

(1) general workmanship has been maintained (i.e. there has been no discontinuity of shipbuilding or significant changes in the construction methodology or technology at the yard, shipyard personnel are appropriately qualified and demonstrate an adequate level of workmanship as determined by CCS); and
(2) an NDT plan is implemented and evaluated by CCS for the tanks not subject to structural tests. Shipbuilding quality standards for the hull structure during new construction are to be reviewed and agreed during the kick-off meeting. The work is to be carried out in accordance with the Rules and under survey by CCS.

Part C - Non-SOLAS Ships

1 General

1.1 These test procedures are to confirm the watertightness of tanks, watertight boundaries and the structural adequacy of tanks which form part of the watertight subdivisions① of ships. These procedures may also be applied to verify the weathertightness of structures and shipboard outfitting. The tightness of all tanks and watertight boundaries of ships during new construction and those relevant to major conversions or major repairs② is to be confirmed by these test procedures prior to the delivery of the ship.
1.2 Testing procedures of watertight compartments are to be carried out in accordance with PART C for non-SOLAS ships, see SOLAS Chapter I, Regulation 1 and Regulation 3.

2 Application

2.1 Testing procedures are to be carried out in accordance with the requirements of PART A in association with the following alternative procedures for 4.2.2 of PART A "Testing Schedule for New Construction or Major Structural Conversion".
2.2 The tank boundaries are to be tested from at least one side. The tanks for structural test are to be selected so that all representative structural members are tested for the expected tension and compression.
2.3 The requirements given in Table 1 of Part A to structurally test tanks to 2.4 metres above the top of the tank do not apply. Instead, the minimum test pressure for structural testing is to be taken as 0.3D + 0.76 metres above the top of the tank where the top of the tank is the deck forming the top of the tank, excluding any hatchways and D is the depth of the ship. The minimum test pressure need not be taken greater than 2.4 metres above the top of the tank.
2.4 Structural tests are to be carried out for at least one tank of a group of tanks having structural similarity (i.e. same design conditions, alike structural configurations with only minor localised differences determined to be acceptable by the attending Surveyor) on each vessel provided all other tanks are tested for leaks by an air test. The acceptance of leak testing using an air test instead of a structural test does not apply to cargo space boundaries adjacent to other compartments in tankers and combination carriers or the boundaries of tanks for segregated cargoes or pollutant cargoes in other types of ships.
2.5 Additional tanks may require structural testing if found necessary after the structural testing of the first tank.
2.6 For tanks which are less than 2 m^3 in volume, structural testing may be replaced by leak testing.
2.7 Where the structural adequacy of the tanks and spaces of a vessel were verified by the structural testing required by either PART A or PART C section 2.4, subsequent vessels in the series (i.e. sister ships built from the same plans at the same shipyard) may be exempted from structural testing of tanks, provided that:
(1) water-tightness of boundaries of all tanks and spaces are verified by leak tests and thorough inspections are carried out;
(2) structural testing is carried out for at least one tank or space among all tanks/spaces of each sister vessel;
(3) additional tanks and spaces may require structural testing if found necessary after the structural testing of the first tank or if deemed necessary by the attending Surveyor.
For cargo space boundaries adjacent to other compartments in tankers and combination carriers or boundaries of tanks for segregated cargoes or pollutant cargoes in other types of ships, structural tests are to be carried out for at least one tank of a group of tanks having structural similarity (i.e. same design conditions, alike structural configurations with only minor localised differences determined to be acceptable by the attending Surveyor) on each vessel provided all other tanks are tested for leaks by an air test.
For cargo space boundaries adjacent to other compartments in tankers and combination carriers or

① Watertight subdivision means the main transverse and longitudinal subdivisions of the ship.
② Major repair means a repair affecting structural integrity.

boundaries of tanks for segregated cargoes or pollutant cargoes in other types of ships, structural tests are to be carried out for at least one tank of a group of tanks having structural similarity (i.e. same design conditions, alike structural configurations with only minor localised differences determined to be acceptable by the attending Surveyor) on each vessel provided all other tanks are tested for leaks by an air test.

2.8 Sister ships built (i.e. keel laid) two years or more after the delivery of the last ship of the series, may be tested in accordance with PART C 2.7 at the discretion of CCS, provided that:

(1) general workmanship has been maintained (i.e. there has been no discontinuity of shipbuilding or significant changes in the construction methodology or technology at the yard, shipyard personnel are appropriately qualified and demonstrate an adequate level of workmanship as determined by CCS); and

(2) an NDT plan is implemented and evaluated by CCS for the tanks not subject to structural tests. Shipbuilding quality standards for the hull structure during new construction are to be reviewed and agreed during the kick-off meeting. The work is to be carried out in accordance with the Rules and under survey of CCS.

Section 4 DOCUMENTATION

4.4.1 Reports

4.4.1.1 The shipyard is to submit relevant inspection, testing, measuring reports and records to the Surveyor and the owner.

4.4.1.2 The Surveyor is to attend the inspection and testing of the specified items, review the relevant inspection, testing, measuring reports and records submitted by the shipyard, and then issue various survey reports, records, data and relevant certificates for the ship's hull and equipment, machinery, electrical installations in the forms specified by the Headquarters of CCS and report this to the Headquarters.

4.4.1.3 The shipyard is to submit the as-built construction drawings referred to in 4.4.2.1 of this Section to the Surveyor.

4.4.2 Documents and information

4.4.2.1 At least one set of the following as-built construction drawings is to be maintained on board the ship and by the shore-based management:

(1) Main plans

① General arrangement;

② Capacity plan;

③ Hydrostatic curves;

④ Loading Manual, where required.

(2) Hull structural plans

① Midship section;

② Scantling plan;

③ Decks;

④ Shell expansion;

⑤ Transverse bulkheads;

⑥ Rudder and rudder stock;

⑦ Cargo hatch covers, when applicable.

(3) Bilge ballast and cargo piping diagrams.

4.4.2.2 The following as-built construction documents and information are to be maintained on board the ship and by the owner and/or the shore-based management:

(1) Technical information of the ship:

① Stability information, calculations, and relevant diagrams and tables;

② Specifications, operation manual, equipment instructions and other guidelines.

(2) Certificates of the ship and its equipment including installations and systems, classification certificates, survey reports and records, and other specific certificates.

4.4.2.3 In general, the date of completion for construction surveys is to be recorded as that for construction. The other important dates for the ship, e.g. the signing date of construction contract, the date of commencement of construction, the date of the keel laid, the date of launching and the date of delivery are also to be recorded.

4.4.2.4 Upon request by the owner, certain special purpose ships are to be additionally provided with the

certificates, information, reports and other technical documents required by an industry organization.
4.4.2.5 The documents and information stated in 4.4.2.1, 4.4.2.2, 4.4.2.3 (if any) above and subsequent documents and information related to them are to be kept by all parties concerned, e.g. the ship, owner or manager of the ship, for the lifetime of the ship.
4.4.2.6 CCS is to, at least during the period in which the ship is classed with CCS, maintain the drawings and documentation referred to in 4.4.2.1, 4.4.2.2(1)①, 4.4.2.2(2) and 4.4.2.4 that are related to the classification management of the ship.

Section 5 ASSIGNING CLASS FOR A NEW BUILDING PROJECT WHEN THE DESIGN IS ALREADY APPROVED BY AN INITIAL SOCIETY①

4.5.1 General requirements

4.5.1.1 This Section is applicable to assigning class for a newbuilding project by Memorandum of Understanding (MoU) adopted between CCS, a Shipyard and, if applicable, a Ship Owner covering the acceptance by CCS of a design based on the prior approval by an Initial Society for a new building.

4.5.2 Assigning class for a new building project based on the Rules and the Memorandum of Understanding between CCS, the Shipyard and, if applicable, a Owner

4.5.2.1 Whenever CCS is requested by an Owner/Shipyard to class a vessel(s) for new construction project when the design is already approved by an Initial Society, the following procedures are to be applied.
(1) CCS may accept to class a new building project vessel when the design is already approved by an Initial Society for new building and all comments are confirmed as dealt with by the Initial Society approving the design.
(2) CCS may accept to class a new building project vessel in accordance with the Memorandum of Understanding (MoU) adopted by CCS and the shipyard, subject to the requirements in (3), (4) and (5) being fulfilled. This MoU is to clearly define requirements for submission of plans as required by 4.5.3 below, harmonizing and resolution of plans already approved by an Initial Society for new building project and comments to be dealt with.
(3) CCS is to perform review and approval of plans based on the Rules. As a minimum scope, the approval of the plans listed in 4.5.3 below is required by CCS to verify compliance with the Rules. CCS is to record the written documentary evidence of the above-mentioned plans which were approved as complying with the Rules or with other requirements confirmed acceptable in accordance with the Rules.
(4) CCS is to perform the survey during fabrication, construction and testing of the vessel based on the Rules.
(5) Certification of materials and components of manufacturers is to be carried out by CCS in accordance with the Rules.

4.5.3 Plans to be submitted by the Shipyard to CCS

4.5.3.1 This paragraph contains the list of plans to be submitted by the Shipyard to CCS. The list of plans varies from ship to ship, but are to include at least the following.
4.5.3.2 Main plans
(1) General Arrangement;
(2) Capacity Plan;
(3) Hydrostatic Curves;
(4) Loading Manual, where required;
(5) Damage Stability calculation, where required.
4.5.3.3 Steel plans
(1) Midship Section;
(2) Scantling Plan;
(3) Decks;
(4) Shell Expansion;

---

① Initial Society is the Society which has previously approved the design using their own Rules and which can provide satisfactory evidence of continued compliance with QSCS.

(5) Transverse Bulkheads
(6) Rudder and Rudder Stock;
(7) Hatch Covers;
(8) For CSR vessels, plans showing, for each structural element, both as-built and renewal thicknesses and any thickness for “voluntary addition”;
(9) Plan of tank testing.
4.5.3.4 Machinery and Electrical plans
(1) Machinery Arrangement;
(2) Intermediate, Thrust- and Screw Shafts;
(3) Propeller;
(4) Couplings and shaft alignment calculation;
(5) Main Engines, Propulsion Gears and Clutch Systems (or Manufacturer make, model and rating information);
(6) For Steam Turbine Vessels, Main Boilers, Superheaters and Economisers (or Manufacturer make, model and rating information) and Steam Piping;
(7) Bilge and Ballast Piping Diagram;
(8) Wiring Diagram;
(9) Steering Gear Systems Piping and Arrangements and Steering Gear Manufacturer make and model information;
(10) Diagram of the air, sounding and overflow systems;
(11) Diagram of cooling systems (sea water and fresh water);
(12) Diagram of fuel oil system;
(13) Diagram of the lubricating oil system;
(14) Diagram of the hydraulic systems intended for essential services or located in machinery spaces;
(15) Diagrams of sea water and / or freshwater piping systems;
(16) Electrical power balance (main and emergency supply);
(17) General specification for the automation of the ship;
(18) Detailed specification of the essential service systems;
(19) List of components used in the automation circuits, and references (Manufacturer, type, etc.);
(20) General diagram showing the monitoring and/or control positions for the various installations, with an indication of the means of access and the means of communication between the positions as well as with the engineers;
(21) Diagrams of the supply circuits of automation systems, identifying the power source;
(22) List of monitored parameters for alarm/monitoring and safety systems;
(23) Diagram of compressed air system.
4.5.3.5 Torsional vibration calculations.
4.5.3.6 For vessels with ice class notation, plans for flexible couplings and/or torque limiting shafting devices in the propulsion line shafting (or manufacturer make, model and rating information) are also to be provided.
4.5.3.7 For oil tankers, the following plans are also to be provided:
(1) Pumping arrangement at the forward and after ends and drainage of cofferdams and pump rooms.
4.5.3.8 For ships assigned with unattended machinery space notation, the following plans are also to be provided:
(1) Instrument and Alarm List;
(2) Fixed Fire Detection and Alarm System;
(3) List of Automatic Safety Functions (e.g. slowdowns, shutdowns, etc.);
(4) Function Testing Plan.
4.5.3.9 Document(s) of Approval of Alternative Design and Arrangements, if any.
4.5.3.10 Other plans as required by the Rules are also to be provided depending on the type of ship.

Section 6 ASSIGNING DUAL CLASS FOR A NEW BUILDING

4.6.1 General requirements

4.6.1.1 Each Society acts on behalf of the other Society in accordance with the trilateral agreement adopted by the two Societies and the shipyard. This agreement is to clearly define modalities such as submission of plans, rules to be applied, harmonizing and resolution of plan approval comments between societies.

4.6.2 Plan submission and survey

4.6.2.1 Plans and documents related to classification requirements are to be submitted to each Society by the shipyard.

4.6.2.2 One set of plans and documents fully approved by the First Society shall be provided to the Second Society and each Society is to perform review and approval of plans based on its own classification Rules. As a minimum scope, the approval of the plans listed in 4.5.3, Section 5, Chapter 4 of this PART is required by the Second Society to verify compliance with its applicable classification Rules. The Second Society is to record written documentary evidence of the above-mentioned plans which were approved as complying with the Second Society's own Rules or with other requirements confirmed acceptable in accordance with its own Rules.

4.6.2.3 Each Society is to perform the survey during fabrication, construction and testing of the vessel based on its own classification Rules and in accordance with the work agreed by the two Societies and described in the trilateral agreement, and/or the bilateral agreement adopted by the two Societies, if any.

Appendix 1 HULL SURVEY FOR NEW CONSTRUCTION

1. Scope

1.1 The scope of this Appendix includes the following main aspects:

(1) examination of the parts of the ship covered by CCS rules and by applicable statutory regulations for hull construction, to obtain appropriate evidence that they have been built in compliance with the classification rules and regulations, taking account of the relevant approved drawings;

(2) appraisal of the manufacturing, construction, control and qualification procedures, including welding consumables, weld procedures, weld connections and assemblies, with indication of relevant approval tests;

(3) witnessing inspections and tests as required in the classification rules used for ship construction including materials, welding and assembling, specifying the items to be examined and/or tested and how (e.g. by structural, hydropneumatic, hose or leak testing, non-destructive examination, verification of geometry) and by whom.

1.2 Appraisal of material and equipment used for ship construction and their inspection at works is not included in this Appendix. Details of requirements for hull and machinery steel forgings and castings and for normal and higher strength hull structural steel are given in CCS Rules for Materials and Welding. Acceptance of these items is verified through the survey process carried out at the manufacturer's works and the issuing of the appropriate certificates.

1.3 In addition to the above, for tankers and bulk carriers subject to SOLAS Reg. II-1/3-10 (Goal-based ship construction standards for bulk carriers and oil tankers) (hereinafter referred to as "GBS ships[①]"), see also Annex 2 to this Appendix.

2. Definitions[②]

2.1 For the purpose of this Appendix, the relevant terms are defined as follows:

(1) Hull structure: the following parts and/or structural members are covered:

① hull envelope including all internal and external structures;

② superstructures, deckhouses and casings;

③ welded foundations, e.g. main engine seatings;

④ hatch coamings, bulwarks;

⑤ all penetrations fitted or welded into bulkheads, decks and shell;

⑥ the fittings of all connections to decks, bulkheads and shell, such as air pipes and ship side valves – all ILLC 1966, as amended, items;

⑦ welded attachments to shell and decks, e.g. crane pedestals, bitts and bollards, but only as regards their interaction on the hull structure.

(2) Documents: reference to documents also includes electronic transmission or storage.

(3) Survey methods: survey methods which the Surveyor is directly involved in are patrol, review, witness, defined respectively as follows:

① Patrol: the act of checking on an independent and unscheduled basis that the applicable processes, activities and associated documentation of the shipbuilding functions identified in Table 1 continue to conform with classification and statutory requirements;

② Review: the act of examining documents in order to determine traceability, identification and to confirm that processes continue to conform with classification and statutory requirement;

③ Witness: the attendance at scheduled inspections in accordance with the agreed Inspection and Test Plans to the extent necessary to check compliance with the survey requirements.

3. Application

3.1 This Appendix covers the survey of all new construction of steel ships intended for classification and for international voyages.

3.2 This Appendix covers all statutory items, relevant to the hull structure and coating, i.e. Load Line and SOLAS Safety Construction.

3.3 This Appendix does not cover the manufacture of equipment, fittings and appendages regardless whether they are made inside or outside of the shipyard, examples being as follows. Evidence of acceptance is to be provided by accompanying documentation from class Surveyor at manufacturer and

---

① The requirements for GBS ships in this PART are to be implemented from 1 July 2016.

② Terminology for hull terms and hull survey terms can be found in IACS Recommendation No.82.

verified at the shipyard:
(1) hatch covers;
(2) doors and ramps integral with the shell and bulkheads;
(3) rudders and rudder stock;
(4) all forgings and castings integral to the hull.
3.4 This Appendix applies to the installation into the ship, welding and testing of:
(1) the items listed in 3.3 above;
(2) equipment forming part of the watertight and weathertight integrity of the ship.
3.5 This Appendix applies to the hull structures constructed and coating applied at any of the following:
(1) shipbuilder's facilities;
(2) sub-contractors at the shipbuilder's facilities;
(3) sub-contractors at their own facilities or at other remote locations.

4. Qualification and monitoring of personnel

4.1 CCS Surveyors are to, through patrol, review and witness as defined in 2.1(3) of this Appendix, verify that the ships are built using approved plans in accordance with the relevant rules and statutory requirements. The Surveyors are to be qualified to be able to carry out the tasks.
4.2 CCS is to establish and implement relevant management procedures to ensure that the activities of the Surveyors are monitored.

5. Survey of the hull structure

5.1 Table 1 provides a list of surveyable items for the hull structure and coating covered by this Appendix, including:
(1) description of the shipbuilding functions;
(2) classification and statutory survey requirements;
(3) survey method required for classification;
(4) relevant classification rules, IACS and statutory requirement references;
(5) documentation to be available for the Surveyor during construction:
① the shipbuilder is to provide the Surveyors access to documentation required by classification, this includes documentation retained by the shipbuilder or other third parties;
② the following documents are to be submitted to CCS for approval or examination for the specific new construction:
a. plans and supporting documents;
b. examination and testing plans;
c. NDE plans;
d. welding consumable details;
e. welding procedure specifications;
f. welding plan or details;
g. welders' qualification records;
h. NDE operators' qualification records;
(6) documents to be inserted into the ship construction file. Refer to paragraph 10 for details;
(7) a list of specific activities which are relevant to the shipbuilding functions. This list is not exhaustive and can be modified to reflect the construction facilities or specific ship type.
5.2 Evidence is also to be made available, as required, by the shipbuilder, to the surveyor whilst the construction process proceeds to prove that the material and equipment supplied to the ship has been built or manufactured under survey by CCS relevant to the classification rules and statutory requirements.

6. Review of the construction facility

6.1 CCS is to, by means of review, familiarize itself with the yard's production facilities, management processes, and safety for consideration in complying with the requirements of Table 1 prior to any steelwork or construction taking place in the following circumstances:
(1) where CCS has none or no recent experience of the construction facilities – typically after a one year lapse, or when significant new infrastructure has been added;
(2) where there has been a significant management or personnel re-structuring having an impact on the ship construction process; or
(3) where the shipbuilder contracts to construct a ship of a different type or substantially different in design.
6.2 Review of the construction facility may be referred to Annex 1 "Shipyard Review Record".

7. Newbuilding survey planning

7.1 Prior to commencement of surveys for any newbuilding project, CCS is to discuss with the shipbuilder at a kickoff meeting the items listed in Table 1. The purpose of the meeting is to agree how the list of specific activities shown in Table 1 is to be addressed. If a surveyor has been nominated for a specific newbuilding project, then the surveyor is to attend the kickoff meeting. The meeting is to:

(1) take into account the shipbuilders' construction facilities and ship type;

(2) include the list of proposed subcontractors;

(3) the builder is is to agree to:

① undertake ad hoc investigations during construction as may be requested by CCS where areas of concern arise and keep CCS advised of the progress of any investigation;

② whenever an investigation is undertaken, in principle, suspend relevant construction activities if warranted by the severity of the problem;

(4) make a record of the meeting.

7.2 Attention is to be given to specific published Administration requirements and interpretations of statutory requirements.

7.3 The shipyard is to advise CCS of any changes to the activities agreed at the kickoff meeting and these are to be documented in the survey plan, e.g.:

(1) if the shipbuilder chooses to use or change sub-contractors, or;

(2) if the shipbuilder chooses to incorporate any modifications necessitated by changes in production or inspection methods, rules and regulations, structural modifications, or;

(3) in the event where increased inspection requirements are deemed necessary as a result of a substantial nonconformance or otherwise.

7.4 Shipbuilding quality standards for the hull structure during new construction are to be reviewed and agreed during the kickoff meeting. Structural fabrication is to be carried out in accordance with IACS Rec.47[①], or a Recognized Fabrication Standard (RFS) which has been accepted by CCS prior to the commencement of fabrication/construction. The work is to be carried out in accordance with the Rules and under survey by CCS.

CCS may accept an RFS as an alternative to IACS Rec.47 provided that 7.4.1 or 7.4.2 is complied with as applicable.

7.4.1 Where a RFS is well established and has well documented history (3 or more years prior to the new vessel contract) of successful application to similar designs as the new vessel and that history is for the same Shipyard as the new vessel. Then the Shipyard is to create a summary document referencing the RFS to be used in construction and highlighting any limitations to usage of the selected RFS. This summary document is to be included with the "record of kick-off meeting" for the vessel.

The summary document is also to be included in the SCF, (for Tankers and Bulk Carriers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10 per Annex 2 of Appendix 1 in this chapter, Table A Tier II Item 11), as applicable.

7.4.2 Where a RFS is new or revised or otherwise not as per 7.4.1 the following steps are to be carried out:

(1) The tolerances and fabrications standards of the RFS are to be compared with those of Recommendation 47. Any that are less stringent than those of Recommendation 47 are to be identified.

(2) The tolerances and fabrication standards of the RFS identified in 7.4.2(1) are to be assessed to determine the acceptability for use and/or any restrictions for usage for the subject (or proposed) design. Details of how the acceptability for use and/or restrictions are to be recorded.

(3) A summary document including the outcomes of 7.4.2(1) and 7.4.2(2) is to be compiled. This document is to also include a reference to the RFS, details of the tolerance and fabrication standards not analysed as part of 7.4.2(2) and any limitations to the usage of the RFS.

The summary document is to be included with the "record of the kick-off meeting" of the vessel. The summary document is also to be included in the SCF, (for Tankers and Bulk Carriers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10 per Annex 2 of Appendix 1 in this chapter, Table A Tier II Item 11), as applicable.

7.5 The kickoff meeting may be attended by other parties (owner, Administrations, etc.) subject to agreement by the shipbuilder.

7.6 In the event of series ship[②] production, the requirement for a kickoff meeting in paragraph 7.1 may be waived for the second and subsequent ships provided that no changes to the specific activities agreed in the kickoff meeting for the first ship are introduced. If any changes are introduced, these are to be agreed in

---

① For detailed requirements of IACS Rec.47, see Appendix 2 of this Chapter.

② Series Ship Production: vessels in the series subsequent to the first one (prototype), i.e. sister ships built in the same shipyard.

a new dedicated meeting and documented in a record of such meeting.

8. Examination and test plan for newbuilding activities

8.1 The shipbuilder is to provide plans of the items which are intended to be examined and tested. These plans need not be submitted for approval and examination at the time of the kickoff meeting. They are to include:

(1) proposals for the examination of completed steelwork – generally referred to as the block plan and are to include details of joining blocks together at the pre-erection and erection stages or at other relevant stages;

(2) proposals for fit up examinations where necessary;

(3) proposals for testing of the structure (leak and hydrostatic) as well as for all watertight and weathertight closing appliances;

(4) proposals for non-destructive examination;

(5) any other proposals specific to the ship type or to the statutory requirements.

8.2 The plans and any modifications to them are to be submitted to the Surveyors in sufficient time to allow review before the relevant survey activity commences.

8.3 In addition to the above, for GBS ships, see also Annex 2 to this Appendix.

9. Proof of the consistency of surveys

9.1 CCS is to be able to provide evidence, e.g. through records, check lists, inspection and test records, etc. that its surveyors have complied with the requirements of the newbuilding survey planning and duly participated in the relevant activities shown in the shipbuilder's examination and test plans.

9.2 In addition, CCS is to maintain records of deficiencies found during the patrolling activities required in Table 1 and described in paragraph 2.1(3). Records are to include the date when deficiency was found, description of the deficiency and the date the deficiency was cleared.

10. Ship construction file

10.1 The purposes of this paragraph are applicable to all ships except GBS ships for which the paragraph 3 of Annex 2 to this Appendix is to be applied. The shipbuilder is to deliver documents for the ship construction file. In the event that items have been provided by another party such as the shipowner and where separate arrangements have been made for document delivery which excludes the shipbuilder, that party has the responsibility. The Ship Construction File is to be reviewed for content in accordance with the requirements of paragraph 10.2.

10.2 It is recognised that the purpose of documents held in the Ship Construction File on board the ship, is to facilitate inspection (survey) and repair and maintenance, and, therefore, is to include in addition to documents listed in Table 1, but not be limited to:

(1) as-built structural drawings including scantling details, material details, and, as applicable, wastage allowances, location of butts and seams, cross section details and locations of all partial and full penetration welds, areas identified for close attention and rudders (see Sections 5, 6, 7, 8 and 16 of Chapter 5 of this PART);

(2) manuals required for classification and statutory requirements, e.g. loading and stability, bow doors and inner doors and side shell doors and stern doors – operations and maintenance manuals (Sections 4 and 5, Chapter 9 of PART TWO of the Rules);

(3) ship structure access manual, as applicable;

(4) copies of certificates of forgings and castings welded into the hull (Chapters 5 and 6 of PART ONE of CCS Rules for Materials and Welding);

(5) details of equipment forming part of the watertight and weather tight integrity of the ship;

① A Cable Transit Seal Systems Register, to be prepared by the shipbuilder for watertight cable transits. The Register can be in either a hard copy or digitized media. For an example of a register see "Annex 3 of this Appendix - Recommendatory Sample - Cable Transit Seal Systems Register". It is to include a marking / identification system, documentation referencing manufacturer manual(s) for each type of cable transit installed, the Type Approval certification for each type of transit system, applicable installation drawings, and a recording of each installed transit documenting the as built condition after final inspection in the shipyard. This is to include sections to record any inspection, modification, repair and maintenance.

(6) tank testing plan including details of the test requirements (Section 3 of this Chapter);

(7) corrosion protection specifications (Sections 6, Chapter 1 of PART TWO of the Rules);

(8) details for the in-water survey, if applicable, information for divers, clearances measurements instructions, tank and compartment boundaries (Chapter 12 of PART EIGHT of the Rules);

(9) docking plan and details of all penetrations normally examined at dry-docking;

(10) coating technical documents (for ships implementing “Guidelines for Implementation of IMO Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in All Types of Ships and Double-Side Skin Spaces of Bulk Carriers” and/or ships having PSPC notation.

Items for Hull Survey **Table 1**

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS① requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
	Shipbuilding quality control function								
1	Welding								
1.1	Welding consumables	Works approval of the manufacturer by CCS	Review approval status and patrol, verify storage, handling and treatment in accordance with manufacturer's requirements	UR W17		Consumable specification and approval status	Not required	Identify consumables against approved list	
								Verify temporary and permanent storage facilities	e.g. kept dry, covered, where applicable heated
								Verify traceability	e.g. random batch number checking
1.2	Welder qualification	Qualified welders	Review of welder certification and patrol	IACS Rec.47		Shipyard's records with individual's identification	Not required	Verify welder qualification standard, e.g. class or recognised standard approval	
								Verify welder approved for weld position	
								Verify validity of qualification certificate	
1.3	Welding – mechanical properties (welding procedures)	All weld joint configurations, positions and materials to be covered by weld procedures approved by CCS	Review and patrol	UR W28		Approved weld procedure specification and welding plan relevant to the ship project or process	Not required	Verify procedures are available at relevant workstations	
		CCS witnesses all new weld procedure	Witness					Verify weld procedures records	

① IACS Recommendations indicated in this Table are not mandatory requirements, IACS UI are given in CCS Guidelines for Implementation of Statutory Surveys (Ships Engaged on International Voyages).

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
		qualification tests carried out in the shipyard whenever CCS is surveying in the shipyard						have been approved and cover all weld processes and positions in accordance with Rules or recognised standards and are available for the Surveyor's reference	
1.3a	Welding equipment	Correctly calibrated and maintained	Patrol and review			Shipbuilder's maintenance and calibration records	Not required	Verify condition of machinery and equipment	
								Verify machines are calibrated by appropriate staff	
								Verify calibration carried out in accordance with manufacturer's recommendations	
								Verify calibration in accordance with maintenance schedule	
1.3b	Welding environment	Satisfactory environment	Patrol	IACS Rec.47			Not required	Verify welding areas clean, dry, well lit	
								Confirm relevant measures taken for any pre or post heat treatment, drying of surfaces prior to welding	
								Confirm shielding gases, fluxes protected	
1.3c	Welding supervision	Sufficient number of skilled supervisors	Review and patrol	UR W33, IACS Rec.47				Verify supervision is effective	
1.4	Welding – surface	Substantially free from significant	Visual examination, surface detection	UR W33, IACS Rec.47		Shipbuilder's and recognised standards	Not required	Identify workstations where NDE is carried	

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
	discontinuities	indications, satisfactory profile and size	techniques, review of documents and patrol of operator			and Rules as applicable, welding and NDE plans, NDE report		out, e.g. panel line butt welds, castings into hull structure	
								Verify NDE carried out in accordance with approved plans where applicable	
								Verify suitability of NDE methods	
								Verify operators suitably qualified particularly where sub-contractors have been employed	
								Verify NDE is carried out according to the acceptable process	
								Review NDE records	
1.5	Welding – embedded discontinuities	NDE is to be carried out by qualified operators capable of ensuring that welds are substantially free from significant indications	Radiography and ultrasonic testing, review of documents and patrol of operator, examination of films	UR W33, IACS Rec.47		Shipbuilder's and recognised standards and Rules as applicable, welding and NDE plans, NDE reports, operator qualifications	Not required	Identify workstations where NDE is carried out, e.g. panel line butt welds, castings into hull structure	
								Verify NDE carried out in accordance with approved plans where applicable	
								Verify suitability of NDE methods	
								Verify operators suitably qualified particularly where sub-contractors have been employed	
								Verify that records have been completed and in accordance with recoginsed standards, e.g. IQI and sensitivity	

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
								recorded	
								Verify that reports and radiographs have been evaluated correctly by the shipbuilder. Systematic review of radiographs carried out by the Surveyor	
								Verify equipment calibration satisfactory and in accordance with manufacturer's and recognised standards requirements	
								Verify NDE is carried out according to the acceptable process	
2	Steel preparation and fit-up								
2.1	Surface preparation, marking and cutting	Traceability and acceptability of material, check of steel plates & profiles, materials type, scantling identification, testing marks	Patrol	IACS Rec.47		Material certificates, shipbuilder's marking/cutting production documents at the workstation – documents retained at the facility	Not required	Verify stockyard storage satisfactory	
								Verify material traceability, e.g. stamping identification against material certification, archiving of records	
								Verify transfer marking after treatment line	
								Verify standard of shot-blasting and priming	
								Verify suitability of primer	
								Verify that steel grades can be identified	

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
								Verify machinery adjusted to maintain within IACS or manufacturer's recommendations	
								Verify accuracy of marking and cutting	
								Verify storage of piece parts	
2.2	Straightening	Approval of straightening methods/procedures against deformation	Patrol and review	IACS Rec.47		Recognised standards, approved procedures	Not required	Verify that straightening processes are approved for the grade and type of steel, e.g. TMCP, z plate	
								Verify that plates and sections are within recognised tolerances	
2.3	Forming	Maintain material properties. Acceptance of forming method against unproper deformations	Patrol	IACS Rec.47		Shipbuilder's procedure for hot forming	Not required	Verify that temperature control is exercised by the operator	
								Verify that suitable methods of temperature control are available when forming special steels and materials	
								Verify that forming processes are acceptable	
2.4	Conformity with alignment/fit-up/gap criteria	Check alignment/fit-up/gap against reference standards	Patrol	IACS Rec.47		Shipbuilder's and recognised standards and Rules as applicable	Not required	Verify the processes to ensure satisfactory fit-up and alignment at all workstations	
								Verify that edge preparations are reinstated where lost during fitting	

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
								operations	
								Verify remedial procedures are in place to compensate for wide gaps and alignment deviations	
2.5	Conformity for critical areas, when defined, with alignment/fit-up or weld configuration	Check alignment/fit-up/gap against approved drawings	Witness and review	IACS Rec.47		Shipbuilder's and recognised standards and Rules as applicable, approved plan or standard, builder's records	Approved plans of critical areas if applicable	Verify that the information relevant to the latest approved drawings is available at the workstations	
								Verify the processes to ensure satisfactory fit-up and alignment at all workstations	
								Verify that edge preparations are reinstated where lost during fitting operations	
								Verify remedial procedures are in place to compensate for wide gaps and alignment deviations	
3	Steelwork process, e.g. sub-assembly, block, grand and mega block assembly, pre-erection and erection, closing plates	Compliance with approved drawings, visual examination of welding and material, check alignment and deformations	Patrol of the process and witness of the completed item	IACS Rec.47		Approved plans, shipbuilder's inspection records, shipbuilder's and recognised standards and Rules as applicable, construction plan (steelwork subdivision)		Verify that the information relevant to the latest approved drawings is available at the workstations	
								Verify that correct weld sizes have been adopted	
								Verify operation of the welding processes at the different work stages is satisfactory	
								Verify that piece parts are identifiable	

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
								Verify that fit-ups are within recognised tolerances	
								Verify that correct welding requirements specified in No.1 of this Table have been adopted	
								Verify processes for closing plates etc. are acceptable	
								Confirm that hull structure is in accordance with the approved plan	
4	Remedial work and alteration	Welding, check against deformation, alignment	Review records and witness	IACS Rec.47		Permanent record of shipyard surveyable items		Verify that records have been maintained of significant deviations from the approved plans, for situations such as mis-cut openings, re-routing outfit items	
								Verify that all deviations brought to the attention of the Surveyor by the shipbuilder are acceptable	
5	Tightness testing, including leak and hose testing, hydropneumatic testing	Absence of leaks	Review and witness of the test	UR S14	Reg. II-1/11 of SOLAS, as amended	Approved tank testing plan, shipbuilder's inspection records	Approved tank testing plan	Confirm that tank testing is carried out in accordance with the approved plan	
								Confirm the methods used to carry out leak testing	
								Confirm that correct test pressures maintained for leak,	

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
								hose and hydro and hydropneumatic testing is satisfactory	
								Verify that adequate records of the tank testing have been maintained	
6	Structural testing	Structural adequacy of the design	Review and witness of the test	UR S14	Reg. II-1/11 of SOLAS, as amended	Approved tank testing plan, shipbuilder's inspection records	Approved tank testing plan	Confirm that tank testing is carried out in accordance with the approved plan	
								Confirm that correct test pressure maintained for testing is satisfactory	
								Verify that adequate records of the tank testing have been maintained	
7	Corrosion protection systems, e.g. coatings, cathodic protection, impressed current except for coating system subject to PSPC	Salt water ballast tanks with boundaries formed by the hull envelope, and also bulk carrier hold internal surfaces, coamings and hatch covers are to have an efficient protective coating. The safety of cathodic systems to be dealt with separately	Review and report on builder's & manufacturer's documentation	UR Z8 & Z9 , UI SC122, UR F1	Reg. II-1/3-2 of SOLAS, as amended	Manufacturer's and builder's specifications	Corrosion protection specifications	Verify that applied coatings are approved and review records of application	
								Verify that adequate records have been maintained and copied to the ship construction file	

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
	Application of antifouling systems		Review		AFS Convention	Painting specification	Paint specification and Mfg Declaration	Verify that adequate records have been maintained and copied to the ship construction file	
7.1	Application of protective coatings for dedicated seawater ballast tanks in all types of ships and double-side skin spaces of bulk carriers subject to PSPC	Monitor implementation of the coating inspection requirements	Patrolling and review	UI SC223	Reg. II-1/3-2 of SOLAS, as amended	Signed and verified tripartite Agreement	Coating Technical File	Verify that applied coatings are approved and review records of application in accordance with Chapter 7 of Annex to MSC.215(82)	
8	Installation, welding and testing of the following:								
8.1	Hatch covers	Tightness and securing	Witness	UR S14 and IACS Rec. 14	Reg. 13, 14, 15 and 16 of ILLC ’66	Approved tank testing plan, shipbuilder’s inspection records	Details required, structural drawings	Confirm leak test of hatch covers	
								Confirm operation and securing test	
8.2	Doors and ramps integral with the shell and bulkheads	Tightness and securing	Witness	UR S14	Reg. II-1/18 of SOLAS as amended, Reg. 12 and 21 of ILLC ’66	Approved tank testing plan, shipbuilder’s inspection records	Details required	Confirm leak test	
								Confirm operation and securing test	
								Confirm safety device operation	
								Ensure correct maintenance logs/manuals supplied with the ship construction file	
8.3	Rudders	Fitting	Witness	UR S14		Approved plan, shipbuilder’s	Details required,	Confirm alignment and mounting and	

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
						inspection records	structural drawings	fitting up to the connection to the tiller	
								Confirm function test	
								Verify fitting of pintles and all securing bolts	
								Verify all fit-up records including all clearances maintained and placed into the ship construction file	
8.4	Forgings and castings	Compliance with approved drawings, visual examination of welding and material, check alignment and deformations	Patrol of the process and witness of the completed item	UR W7 & W8		Approved plans, shipbuilder's inspection records, shipbuilder's and recognised standards and Rules as applicable, construction plan (steelwork subdivision)	Copies of certificates of forgings and castings	Verify castings and forgings against material certificate	
								Verify that correct welding and fit-up requirements specified in Nos. 1, 2.4 and 2.5 of this Table have been adopted	
								Verify that material certificates are included in the ship construction file	
	Appendages							Verify that correct welding and fit-up requirements specified in reference 1, 2.4 and 2.5 of this Table have been adopted	
8.5	Equipment forming the watertight and weathertight integrity of the ship, e.g. overboard discharges, air	Tightness and securing	Witness		Reg. II-1/16 & 16-1 of SOLAS, as amended; Reg. 17, 18, 19, 20, 22, 23 of ILLC '66	Approved tank testing plan, shipbuilder's inspection records	Details required	Verify that correct welding and fit-up requirements specified in Nos. 1, 2.4 and 2.5 of this Table have been adopted	
								Verify compliance with Load Line	

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
	pipes, ventilators							Convention 1966 as amended - i.e. all fittings in accordance with the record of freeboard assignment	
				UR P3				Verify closing devices, e.g. air pipes, vents etc are of approved type	
								Verify material certificates for overboard discharges where applicable	
								Verify record of freeboard assignment and all material certificates included in the ship construction file	
	Freeboard marks and draft marks	Within allowable tolerances and in accordance with the freeboard assignment	Witness	UI-LL4	Reg. 4, 5, 6, 7 and 8 of ILLC'66		Details required	Verify freeboard marks in accordance with load line assignment	
								Verify draft marks in accordance with the agreed tolerances specified by the builder unless more onerous flag State requirements	
	Principal dimensions	Within allowable tolerances	Review and witness	IACS Rec. 47			Details required	Verify principal dimensions in accordance with recognised standard	
								Verify dimensions included in the ship construction file	
	Safety Construction certification	No outstanding imperfections or defects	Witness		Reg. I/7 or Reg. I/10 of SOLAS, as amended (as			Verify that Administration requirements have	

No.	Shipbuilding function	Survey requirements for classification	Survey method required for classification	IACS© requirements	Statutory requirements and relevant reference	Documentation available to Surveyor during construction	Ship construction file	Specific activities	Proposals for the project
					appropriate).			been incorporated into the hull structure	
8.6	Watertight cable transit seal systems	Compliance with approved drawings, visual examination of fitting, check alignment and securing	Patrol of the process and witness of the completed item		Reg. II-1/13 and 13-1 of SOLAS as amended	Shipbuilder's inspection records, manufacturer's specification	Cable Transit Seal Systems Register	Verify that correct welding and fit up requirements, including as specified in reference 1, 2.4 and 2.5 of this table have been adopted	
								Verify watertight cable transit seal systems are type approved	
								Verify the format and content of the Register

Annex 1 Shipyard Review Record

Name of shipyard	Date

1 Details of any management systems

Obtained approval	Certified by	Expiry date	Remarks (scope, etc.)
ISO 9001			
ISO 14001			
ISO 45001			
Other:			

2 Construction facilities: (Documents such as a brochure of shipyard can be attached in lieu of completing this section)

2.1 Building berth (B) or dock (D) * In case of berth, depth is not applicable.

B/D	Name	Length (m)	Width (m)	Depth*(m)	Building capacity (Gross tonnage)	Crane (ton × no.)

2.2 Outfitting quays

Name	Length (m)	Width (m)	Depth (m)	Berthing capacity (Gross tonnage)	Crane (ton × no.)

2.3 Main fabrication and erection facilities

(1) Marking and cutting of steel plates (including internal members) – Marking method (Manual, Photo × __, EPM × __, NC × __others _____) – NC cutting machine (Gas × __, Plasma × __, Laser × __) Control procedure of NC (On-line, other) – Cutting equipment (Edge planer × __, Roll-shear × __)
(2) Marking and cutting of section bar – Marking method (Manual, NC) – Marking of reference curved line (Manual, NC) – Cutting method (Manual, NC) – In case of NC (Gas × __, Plasma × __)
(3) One-side automatic welding machine (Yes, No) – Type of welding machine (Flux Backing × __, Flux and Copper Backing × __other _____) – Existence of special surface plate for plate welding (Yes, No)
(4) Fillet welding machine (Gravity, Automatic) Percentage of automatization except gravity: about __% – Line welder (No, Yes: submerged arc × __heads, CO_2 × __heads) – Small automatic fillet welding machine (No, Yes: Name: _____ × __) – Welding robot (No, Yes: Portal × __, Rectangular × __, Articulated × __)
(5) Painting equipment – Plate shot blasting/primer coating machine (No, Yes: Max. Width __ m, Length __ m) – Section bar shot blasting/primer coating machine (No, Yes: Max. Length __ m) – Special coating factory (No, Yes: __m × __ m × __ sections)
(6) Vertical automatic welding machine (No, Yes: EG × __, SEG × __, ES × __) EG: Electrogas SEG: Simplified Electrogas ES: Electroslag
(7) Other main fabrication facilities

3 Shipyard control of qualified welders

(1) Normal steel

		Certification	Traceability	Supervision	Maintenance of qualification
Shipyard workers	Confirm system in place	Yes/No	Yes/No	Yes/No	Yes/No
Subcontracted workers	Confirm system in place	Yes/No	Yes/No	Yes/No	Yes/No

4 Feature of construction procedure

(1) Subcontract of hull blocks (weight) – Sub members (No, Yes: Ratio of subcontracted works __ %, No., of subcontractors __) – Blocks (No, Yes: Ratio of subcontracted works __ %, No., of subcontractors __)
(2) Method of plate block assembly – Method fitting and welding longitudinals and transverse webs on jointed panels – Method welding longitudinals on jointed panels prior to fitting and welding transverse webs – Method fitting and welding a frame consists of longitudinals and transverse webs on jointed panels – Method jointing panels with pre-assembled longitudinals by welding prior to fitting and welding transverse webs – Other (please specify in (5) below)
(3) Pre-erection outfitting carried out Grand block/mega block adopted Method of erection at building berth/dock – Max. weight of loading block: tons – Construction method in building dock/berth/land construction etc. (1 ship, 1.5 ships: Semi-tandem, dual entrance) – Block loading process (single starting block, multi starting blocks, inserting block : No, Yes)
(4) Final dock (No, Yes: In-house, Other place of the same company, Use other company)
(5) Other feature of construction procedure

5 Quality control system (refer to Quality Manual, if available):

Item and description	Result	Remark
(1) Existence of the organization chart including the departments of design, purchasing, manufacturing and quality assurance – Are the function, responsibility and competence of the organization clear?		
(2) Quality control organization – Existence of quality control organization – Number of employees in this organization – Existence of procedures or plans related to tests and inspections	__ persons, including the chief	
(3) Pre-inspection system of shipyard – Is pre-inspection carried out prior to class inspection? – Are pre-inspectors assigned? (check the list.) – Number of pre-inspectors (related to hull only) – Are inspection results marked on the object and/or recorded in the checklist?	__ persons	
(4) Records of inspections and tests – Are records made and kept properly? – Does the responsible person verify the records? – Can the adoption of necessary corrective actions against nonconformity happened be checked?		
(5) Condition at the time of the surveys in the presence of class surveyors – Is the schedule of the surveys changed often? – Are pre-inspection, shipyard inspection and repairs completed beforehand? – Are the sufficient preparations for surveys such as scaffoldings, lighting, cleaning made?		
Note: Above-mentioned (3) and (4) include the acceptance inspection of subcontracted items.		

6 Measures for safety and health

Item and description	Result	Remark
(1) Are conditions of scaffolding, nets, safety belt, lighting and ventilation good?		
(2) Does sufficient attention paid for radiographic examination and operation of cherry picker?		
Note:		

7 Control system of non-destructive examination (NDE)

Item and description	Result	Remark
(1) Number of NDE supervisors in shipyard (including persons responsible for judging results)	_____ persons	
(2) Dependence on subcontracted NDE work – Number of shipyard employees – Number of sub-contractors	 _____ persons _____ persons	
(3) NDE sub-contractor company's name and official technical qualifications	Name _____ (approved by) _____ Name _____ (approved by) _____	
(4) Grade and number of NDE employees with official technical qualifications in shipyard Specialized in radiography Specialized in ultrasonic Specialized in surface detection	 __ Grade __ persons __ Grade __ persons __ Grade __ persons	
(5) If non-destructive examinations are subcontracted, the grade and number of officially qualified persons Specialized in radiography Specialized in ultrasonic Specialized in surface detection	 __ Grade __ persons __ Grade __ persons __ Grade __ persons	
(6) Non-destructive examination equipment (in-house) – Number of radiographic equipment – Number of ultrasonic equipment	 _____ _____	
Note: Even if all works are subcontracted, it is recommendable to attach the qualified person(s) who can verify the works.		

8 Quality control on production line

Item and description	Result	Remark
8.1 Preventive measures for misuse of materials		
(1) Job title of supervisor and person in charge of collating ordered steel and received steel, and checking of mill sheet	Title of supervisor: _____ Title of person in charge: _____	
(2) Are means for checking the material grade in hand prescribed for high-grade steels?		
(3) Are regulations prescribed for checking the material grade for high-tensile steel and steel for low-temperature applications? Are there regulations for inscribing high tensile steel on the surface of the high tensile steel and special indication for steel for low temperature applications?		
(4) Are procedures for re-using of remaining cut-off mild steel?		
(5) Are there procedures for re-using of remaining cut-off high-tensile steel?		
(6) In the case of (4) and (5) above, can a collation be made with the mill sheet?		
(7) Section of controlling the lists of remaining cut-off steel	Name of section: _____	
Notes: – In the case of high tensile steel, are means identifying different grades? – In the case of (3) and (4) above, are the materials approved by other classes controlled similarly?		
8.2 Shot blasting/Primer coating		
(1) Existence of surface preparation standards		
(2) Existence of coating thickness control standards – Existence of thickness measurement records		
Note: The standard is to include the description related traceability after shot blasting and primer coating.		
8.3 Marking and cutting (Assembly work)		
(1) Existence of standards for accuracy and periodical inspection of tape measures, tapes, stencils, etc.		
(2) Existence of standards for accuracy of cut dimensions and edge preparation		
(3) Existence of standards for finish of cutting face		
(4) What is the frequency and extent of maintenance and inspection carried out for ensuring accuracy of NC cutter and/or flame planer?		

Item and description	Result	Remark
(5) In case of NC, are the disks, tapes etc., maintained in good condition?		
(6) What are the measures adopted and guidance given to make the worker fully conversant with cutting work standards for maintaining accuracy?		
Note: – In the case of (2) and (3) above, check items are to include confirmation of edge preparations free from piercing hole. – NC for section bars is also to be in accordance with the above.		
8.4 Bending and strain free		
(1) Existence of standards for maximum heating temperatures during water cooling and at the time of bending and distortion removal of steel by quick heating and cooling		
(2) Existence of regulations for plate thickness and bending radius for flange processing		
(3) What are the measures adopted and guidance given to make the worker fully conversant with maintaining quality and accuracy during the bending process?		
Note:		
8.5 Control of welding procedure		
(1) Are all welding procedures applied to the ships approved by the classification society or other IACS members?		
Note:		
8.6 Treatment of serious nonconformities		
(1) Are repair plans submitted to the classification society when serious nonconformities happened?		
(2) Were the NDE (RT/UT) plans submitted at appropriate timing?		
(3) Was the extent of tests extended considering the results of the test?		
Note:		
8.7 Hydrostatic and watertight tests		
(1) Is the test plan submitted to the classification society?		
(2) Are vacuum tests applied to?		
(3) Are local air injection tests during sub-assembly works applied to?		
(4) If (2) or (3) above is applied to, are the test procedures approved by the classification society?		
Note:		

Annex 2 Requirements for Tankers and Bulk Carriers subject to SOLAS Reg. II-1/3-10 (Goal-based ship construction standards for bulk carriers and oil tankers)

1. Examination and test plan for newbuilding activities

1.1 The shipbuilder is to provide plans of the items which are intended to be examined and tested in accordance with CCS Rules in a document known as the Survey Plan, taking into account the ship type and design. This Survey Plan shall be reviewed at the time of the kick off meeting, and must include:

1.1.1 a set of requirements, including specifying the extent and scope of the construction survey(s) and identifying areas that need special attention during the survey(s), to ensure compliance of construction with mandatory ship construction standards including:

(1) types of surveys (visual, non-destructive examination, etc.) depending on location, materials, welding, casting, coatings, etc.;

(2) establishment of a construction survey schedule for all assembly stages from the kick-off meeting, through all major construction phases, up to delivery;

(3) inspection/survey plan, including provisions for critical areas identified during design approval;

(4) inspection criteria for acceptance;

(5) Interaction with shipyard, including notification and documentation of survey results;

(6) correction procedures to remedy construction defects;

(7) list of items that would require scheduling or formal surveys;

(8) determination and documentation of areas that need special attention throughout ship's life, including criteria used in making the determination;

1.1.2 a description of the requirements for all types of testing during survey, including test criteria.

2. Design Transparency

2.1 For ships subject to compliance with IMO Res. MSC.287(87), IMO Res. MSC.290(87), IMO Res. MSC.454(100) and IMO MSC.1/Circ.1343, readily available documentation is to include the main goal-based parameters and all relevant design parameters that may limit the operation of the ship.

3. Ship Construction File (SCF)

3.1 A Ship Construction File (SCF) with specific information on how the functional requirements of the Goal-based Ship Construction Standards for Bulk Carriers and Oil Tankers have been applied in the ship design and construction is to be provided upon delivery of a new ship, and kept on board the ship and/or ashore and updated as appropriate throughout the ship's service. The contents of the Ship Construction File are to conform to the requirements below.

3.1.1 The following design specific information is to be included in the Ship Construction File (SCF):

(1) areas requiring special attention throughout the ship's life, including critical structural areas;

(2) all design parameters limiting the operation of a ship;

(3) any alternatives to the rules, including structural details and equivalency calculations;

(4) "As built" drawings and information which are verified to incorporate all alterations approved by CCS or flag State during the construction process including scantling details, material details, location of butts and seams, cross section details and locations of all partial and full penetration welds;

(5) net (renewal) scantlings for all the structural constituent parts, as built scantlings and voluntary addition thicknesses;

(6) minimum hull girder section modulus along the length of the ship which has to be maintained throughout the ship's life, including cross section details such as the value of the area of the deck zone and bottom zone, the renewal value for the neutral axis zone;

(7) a listing of materials used for the construction of the hull structure, and provisions for documenting changes to any of the above during the ship's service life;

(8) copies of certificates of forgings and castings welded into the hull (UR W7 and UR W8);

(9) details of equipment forming part of the watertight and weather tight integrity of the ship;

① A Cable Transit Seal Systems Register, to be prepared by the shipbuilder for watertight cable transits. The Register can be in either a hard copy or digitized media. For an example of a register see "Annex 3 of this Appendix - Recommendatory Sample - Cable Transit Seal Systems Register". It is to include a marking / identification system, documentation referencing manufacturer manual(s) for each type of cable transit installed, the Type Approval certification for each type of transit system, applicable installation drawings, and a recording of each installed transit documenting the as built condition after final inspection in the shipyard. This is to include sections to record any inspection, modification, repair and maintenance.

(10) tank testing plan including details of the test requirements (UR S14);

(11) details for the in-water survey, when applicable, information for divers, clearances measurements instructions etc., tank and compartment boundaries;
(12) docking plan and details of all penetrations normally examined at drydocking;
(13) Coating Technical File, for ships subject to compliance with the IMO Performance Standard for Protective Coatings (PSPC).

3.1.2 Refer to Table A of this Annex for details of information to be further included. This information has to be kept on board the ship and/or ashore and updated as appropriate throughout the ship's life in order to facilitate safe operation, maintenance, survey, repair and emergency measures.

3.1.3 It is to be noted that parts of the content of the SCF may be subject to various degrees of restricted access and that such documentation may be appropriately kept ashore.

3.1.4 The SCF has to include the list of documents constituting the SCF and all information listed in Table A of this Annex, which is required for a ship's safe operation, maintenance, survey, repair and in emergency situations. Details of specific information that is not considered to be critical to safety might be included directly or by reference to other documents.

3.1.5 When developing an SCF, all of the columns in Table A of this Annex have to be reviewed to ensure that all necessary information has been provided.

3.1.6 It may be possible to provide information listed in the annex under more than one Tier II① functional requirement as a single item within the SCF, for example, the Coating Technical File required by the PSPC②is relevant for both "Coating life" and "Survey during construction".

3.1.7 The SCF has to remain with the ship and, in addition, be available to CCS and flag State throughout the ship's life. Where information not considered necessary to be on board is stored ashore, procedures to access this information should be specified in the onboard SCF. The intellectual property provisions within the SCF should be duly complied with.

3.1.8 The SCF should be updated throughout the ship's life at any major event, including, but not limited to, substantial repair and conversion, or any modification to the ship structure.

3.2 The SCF is to be reviewed③, at the time of new building, in accordance with the requirements of paragraphs 3.1.1 and 3.1.2 and the normal storage location is to be distinguished.

3.2.1 For the SCF stored on board ship, the surveyor is to verify that the information is placed on board the ship, upon completion of ship construction.

3.2.2 For the SCF stored on shore archive, the surveyor is to verify that the information is stored on shore archive by examining the list of information included on shore archive, upon completion of ship construction.

4. Determination of number of Surveyor(s)

CCS will assign adequate number of suitable qualified surveyor(s) for new building projects according to the construction progress of each ship to meet appropriate coverage of the examination and testing activities as agreed in the Survey Plan.

List of Information to be Included in the Ship Construction File (SCF) **Table A**

Tier II items		Information to be included	Further explanation of the content	Example documents	Normal storage location
DESIGN					
1	Design life	• assumed design life in years	• statement or note on midship section	• SCF-specific	on board ship
				• midship section plan	on board ship

① Tier II items means the functional requirements included in the International Goal-based Ship Construction Standards for Bulk Carriers and Oil Tankers (GBS), adopted by IMO Res. MSC 287(87).

② Performance standard for protective coatings for dedicated seawater ballast tanks in all types of ships and double-side skin spaces of bulk carriers, adopted by IMO Res. MSC 215(82), as amended and Performance standard for protective coatings for cargo oil tanks of crude oil tankers, adopted by IMO Res. MSC 288(87), as amended.

③ "Review" means the examination of the SCF that is carried out by the surveyor, at the end of the newbuilding process, in order to confirm that drawings and documents required under the paragraph 3 of the annex, plus the possible additional drawings/documents provided by the shipyard, as per the Ship Constructional File (SCF) list of drawings/documents are present in the copies of the SCF stored on board and in the ashore archive.
The "review" is not to be intended as an assessment of the drawings/documents in order to verify their compliances with the applicable Rules/Regulations.

Tier II items		Information to be included	Further explanation of the content	Example documents	Normal storage location
2	Environmental conditions	• assumed environmental conditions	• statement referencing data source or Rule (specific rule and data) or; • in accordance with Rule (date and revision)	• SCF-specific	on board ship
3	Structural strength				
3.1	General design	• applied Rule (date and revision)	• applied design method alternative to Rule and subject structure(s)	• SCF-specific	on board ship
		• applied alternative to Rule		• capacity plan	on board ship
3.2	Deformation and failure modes	• calculating conditions and results;	• allowable loading pattern	• loading manual	on board ship
		• assumed loading conditions	• maximum allowable hull girder bending moment and shear force	• trim and stability booklet	on board ship
3.3	Ultimate strength	• operational restrictions due to structural strength	• maximum allowable cargo density or storage factor	• loading instrument instruction manual	on board ship
				• operation and maintenance manuals	on board ship
3.4	Safety margins	• strength calculation results	• bulky output of strength calculation	• strength calculation	on shore archive
			• plan showing highly stressed areas (e.g. critical structural areas) prone to yielding and/or buckling	• areas prone to yielding and/or buckling	on board ship
		• gross hull girder section modulus			
		• minimum hull girder section modulus along the length of the ship to be maintained throughout the ship's life, including cross section details such as the value of the area of the deck zone and bottom zone, the renewal value for the neutral axis zone		• general arrangement plan	on board ship
		• gross scantlings of structural constituent parts	• structural drawing	• key construction plans	on board ship
		• net scantlings of structural constituent parts, as built scantlings and voluntary addition thicknesses	• rudder and stern frame		
			• structural details of typical members	• rudder and rudder stock plans	on board ship
				• structural details	on board ship
				• yard plans	on shore archive
				• dangerous area plan	on board ship

Tier II items		Information to be included	Further explanation of the content	Example documents	Normal storage location
		• hull form			
			• hull form information indicated in key construction plans	• lines plan	on shore archive
			• hull form data stored within an onboard computer necessary for trim and stability and longitudinal strength calculations	or	
				Equivalent	on board ship
4	Fatigue life	• applied Rule (date and revision)	• applied design method alternative to Rule and subject structures	• SCF-specific	on board ship
		• applied alternative to Rule			
		• calculating conditions and results;	• assumed loading conditions and rates	• structural details	on board ship
		• assumed loading conditions			
		• fatigue life calculation results	• bulky output of fatigue life calculation	• fatigue life calculation	on shore archive
			• plan showing areas (e.g. critical structural areas) prone to fatigue	• areas prone to fatigue	on board ship
5	Residual strength	• applied Rule (date and revision)		• SCF-specific	on board ship
6	Protection against corrosion				
6.1	Coating life	• coated areas and target coating life and other measures for corrosion protection in holds, cargo and ballast tanks, other structure-integrated deep tanks and void spaces	• plans showing areas (e.g. critical structural areas) prone to excessive corrosion	• SCF-specific	on board ship
6.2	Corrosion addition			• Coating Technical File required by PSPC (Performance standard for protective coatings for dedicated seawater ballast tanks in all types of ships and double-side skin spaces of bulk carriers, adopted by IMO resolution MSC.215(82), as amended and Performance standard for protective coatings for cargo oil tanks of crude oil tankers, adopted by IMO Resolution MSC.288(87), as amended)	on board ship
		• specification for coating and other measures for corrosion protection in holds, cargo and ballast tanks, other structure-integrated deep tanks and void spaces		• areas prone to excessive corrosion	on board ship
		• gross scantlings of structural constituent parts		• key construction plans	on board ship
		• net scantlings of structural constituent			

Tier II items		Information to be included	Further explanation of the content	Example documents	Normal storage location
		parts, as built scantlings and voluntary addition thicknesses			
7	Structural redundancy	• applied Rule (date and revision)		• SCF-specific	on board ship
8	Watertight and weathertight integrity	• applied Rule (date and revision)		• SCF-specific	on board ship
		• key factors for watertight and weathertight integrity	• details of equipment forming part of the watertight and weathertight integrity	• structural details of hatch covers, doors and other closings integral with the shell and bulkheads	on board ship
9	Human element considerations	• list of ergonomic design principles applied to ship structure design to enhance safety during operations, inspections and maintenance of ship		• SCF-specific	on board ship
10	Design transparency	• applied Rule (date and revision) • applicable industry standards for design transparency and IP protection		• intellectual property provisions	on board ship
		• reference to part of SCF information kept ashore		• summary, location and access procedure for part of SCF information on shore	on board ship
CONSTRUCTION					
11	Construction quality procedures	• applied construction quality standard	• recognized national or international construction quality standard	• SCF-specific	on board ship
12	Survey during construction	• survey regime applied during construction (to include all owner and class scheduled inspections during construction)	• applied Rules (date and revision) • copies of certificates of forgings and castings welded into the hull	• SCF-specific • tank testing plan	on board ship on board ship
		• information on non-destructive examination		• non-destructive testing plan	on board ship
				• Coating Technical File required by PSPC	on board ship
IN-SERVICE CONSIDERATIONS					
13	Survey and maintenance	• maintenance plans specific to the structure of the ship where higher attention is called for	• plan showing highly stressed areas (e.g. critical structural areas) prone to yielding, buckling, fatigue and/or excessive corrosion	• SCF-specific • operation and maintenance manuals (e.g. hatch covers and doors)	on board ship on board ship
		• preparations for survey	• arrangement and details of all penetrations normally examined at dry-docking	• docking plan	on board ship
		• gross hull girder section modulus	• detailed information for dry-docking	• dangerous area plan	on board ship

Tier II items		Information to be included	Further explanation of the content	Example documents	Normal storage location
		• minimum hull girder section modulus along the length of the ship to be maintained throughout the ship's life, including cross section details such as the value of the area of the deck zone and bottom zone, the renewal value for the neutral axis zone	• details for in-water survey	• Ship Structure Access Manual	on board ship
				• Means of access to other structure-integrated deep tanks	on board ship
				• Coating Technical File required by PSPC	on board ship
		• gross scantlings of structural constituent parts		• key construction plans	on board ship
		• net scantlings of structural constituent parts, as built scantlings and voluntary addition thicknesses		• rudder and rudder stock	on board ship
				• structural details	on board ship
				• yard plans	on shore archive
			• hull form information indicated in key construction plans	• lines plan	on shore archive
		• hull form		or equivalent	on board ship
14	Structural accessibility	• means of access to holds, cargo and ballast tanks and other structure-integrated deep tanks	• plans showing arrangement and details of means of access	• Ship Structure Access Manual	on board ship
				• means of access to other structure-integrated deep tanks	on board ship
RECYCLING CONSIDERATIONS					
15	Recycling	• identification of all materials that were used in construction and may need special handling due to environmental and safety concerns	• list of materials used for the construction of the hull structure	• SCF-specific	on board ship

Notes:
1. "SCF-specific" means documents to be developed especially to meet the requirements of these GBS guidelines (MSC.1/Circ.1343).
2. "Key construction plans" means plans such as midship section, main O.T. and W.T. transverse bulkheads, construction profiles/plans, shell expansions, forward and aft sections in cargo tank (or hold) region, engine-room construction, forward construction and stern construction drawings.
3. "Yard plans" means a full set of structural drawings, which include scantling information of all structural members.
4. "Hull form" means a graphical or numerical representation of the geometry of the hull. Examples would include the graphical description provided by a lines plan and the numerical description provided by the hull form data stored within an onboard computer.

5. “Lines plan” means a special drawing which is dedicated to show the entire hull form of a ship.
6. “Equivalent (to Lines plan)” means a set of information of hull form to be indicated in key construction plans for SCF purposes. Sufficient information should be included in the drawings to provide the geometric definition to facilitate the repair of any part of the hull structure.
7. “Normal storage location” means a standard location where each SCF information item should be stored. However, those items listed as being on board in the table above should be on board as a minimum to ensure that they are transferred with the ship on a change of owner.
8. “Shore archive” is to be operated in accordance with applicable international standards.

Appendix 2 SHIPBUILDING AND REPAIR QUALITY STANDARD

1 Shipbuilding and Remedial Quality Standards for New Construction

1.1 Scope

It is intended that these standards provide guidance where established and recognized shipbuilding or national standards accepted by CCS do not exist.

1.1.1 This standard provides guidance on shipbuilding quality standards for the hull structure during new construction and the remedial standard where the quality standard is not met. The applicability of the standard is in each case to be agreed upon by CCS.

1.1.1.1 Whereas the standard generally applies to:

(1) conventional merchant ship types;

(2) parts of hull covered by CCS rules;

(3) hull structures constructed from normal and higher strength hull structural steel.

1.1.1.2 The standard does generally not apply to the new construction of:

(1) special types of ships as e.g. gas tankers;

(2) structures fabricated from stainless steel or other, special types or grades of steel.

1.1.2 In this standard, both a “Standard” range and a “Limit” range are listed. The “Standard” range represents the target range expected to be met in regular work under normal circumstances. The “Limit” range represents the maximum allowable deviation from the “Standard” range. Work beyond the “Standard” range but within the “Limit” range is acceptable. In cases where no ‘limit’ value is specified, the value beyond the ‘standard’ range may be accepted subject to the consideration of CCS.

1.1.3 The standard covers typical construction methods and gives guidance on quality standards for the most important aspects of such construction. Unless explicitly stated elsewhere in the standard, the level of workmanship reflected herein will in principle be acceptable for primary and secondary structure of conventional designs. A more stringent standard may however be required for critical and highly stressed areas of the hull, and this is to be agreed with CCS in each case. In assessing the criticality of hull structure and structural components, reference is made to References l.1, 1.2, 1.3, 1.11, 1.13,1.14, 1.15, 1.16, 1.19 and 1.21 to this Section.

1.1.4 Details relevant to structures or fabrication procedures not covered by this standard are to be approved by CCS on the basis of procedure qualifications and/or recognized national standards.

1.1.5 For use of this standard, fabrication fit-ups, deflections and similar quality attributes are intended to be uniformly distributed about the nominal values. The shipyard is to take corrective action to improve work processes that produce measurements where a skew distribution is evident. Relying upon remedial steps that truncate a skewed distribution of the quality attribute is unacceptable.

1.2 General requirements for new construction

1.2.1 In general, the work is to be carried out in accordance with CCS rules and under the supervision of the CCS Surveyor.

1.2.2 Welding operations are to be carried out in accordance with work instructions accepted by CCS.

1.2.3 Welding of hull structures is to be carried out by qualified welders, according to approved and qualified welding procedures and with welding consumables approved by CCS, see Section 1.3. Welding operations are to be carried out under proper supervision by the shipbuilder. The working conditions for welding are to be monitored by CCS in accordance with URZ23 (Reference 1.12 to this Section).

1.3 Qualification of personnel and procedures

1.3.1 Qualification of welders

1.3.1.1 Welders are to be qualified in accordance with UR W32 (Reference 1.18) or other recognized standard accepted by CCS. Recognition of other standards is subject to submission to CCS for evaluation. Subcontractors are to keep records of welders qualification and, when required, furnish valid approval test certificates.

1.3.1.2 Welding operators using fully mechanized or fully automatic processes need generally not pass approval testing provided that the production welds made by the operators are of the required quality. However, operators are to receive adequate training in setting or programming and operating the equipment. Records of training and operation experience shall be maintained on individual operator’s files and records, and be made available to CCS for inspection when requested.

1.3.2 Qualification of welding procedures

1.3.2.1 Welding procedures are to be qualified in accordance with URW28 (Reference 1.10 to this Section) or other recognized standard accepted by CCS.

1.3.3 Qualification of NDT operators

1.3.3.1 Personnel performing non-destructive testing for the purpose of assessing quality of welds in connection with new construction covered by this standard, are to be qualified in accordance with CCS rules or to a recognized international or national qualification scheme. Records of operators and their current certificates are to be kept and made available to the Surveyor for inspection.

In case of non-destructive examination carried out by an independent firm from the shipbuilder, such firm has to comply with UR W35 (Reference 1.20).

1.4 Materials

1.4.1 Materials for Structural Members

1.4.1.1 All materials, including weld consumables, to be used for the structural members are to be approved by CCS as per the approved construction drawings and meet the respective IACS Unified Requirements (References l.4, 1.5, 1.6, 1.7, 1.8, 1.9 and 1.17 to this Section). Additional recommendations are contained in the following paragraphs.

1.4.1.2 All materials used should be manufactured at a works approved by CCS for the type and grade supplied.

1.4.2 Surface Conditions

1.4.2.1 Definitions

(1) Minor Imperfections: Pitting, rolled-in scale, indentations, roll marks, scratches and grooves.

(2) Defects: Cracks, shells, sand patches, sharp edged seams and minor imperfections exceeding the limits of Table 1.

(3) Depth of Imperfections or defects: The depth is to be measured from the surface of the product.

1.4.2.2 Acceptance without remedies

(1) Minor imperfections, in accordance with the nominal thickness (t) of the product and the limits described in Table 1, are permissible and may be left as they are.

Limits for depth of minor imperfection, for acceptance without remedies Table 1

Imperfection surface area Ratio (%)	15 ~ 20%	5 ~ 15%	0 ~ 5%
$t < 20$ mm	0.2 mm	0.4 mm	0.5 mm
20 mm $\le t <$ 50 mm	0.2 mm	0.6 mm	0.7 mm
50 mm $\le t$	0.2 mm	0.7 mm	0.9 mm

(2) Imperfection surface area Ratio (%) is obtained as influenced area / area under consideration (i.e. plate surface area) × 100%.

(3) For isolated surface discontinuities, influenced area is obtained by drawing a continuous line which follows the circumference of the discontinuity at a distance of 20 mm (Figure 1).

(4) For surface discontinuities appearing in a cluster, influenced area is obtained by drawing a continuous line which follows the circumference of the cluster at a distance of 20 mm (Figure 2).

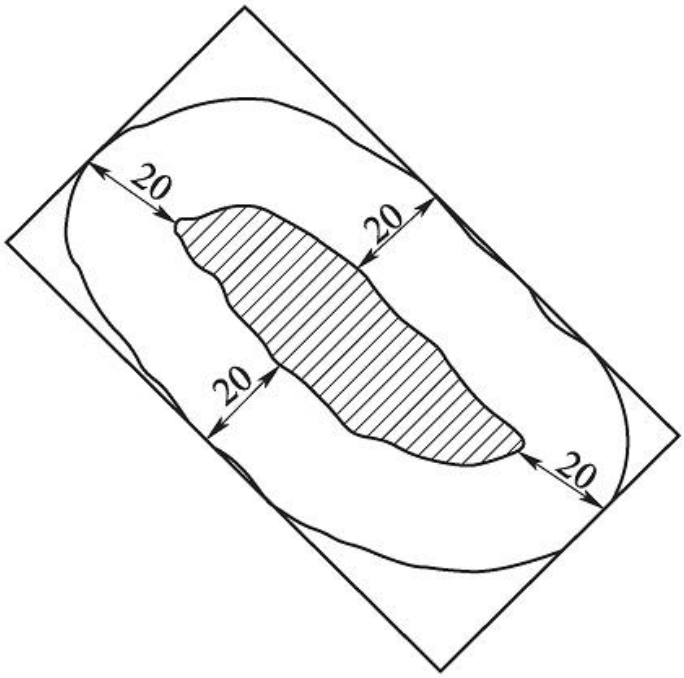

Figure 1 - Determination of the area influenced by an isolated discontinuity (EN 10163-1:2004)

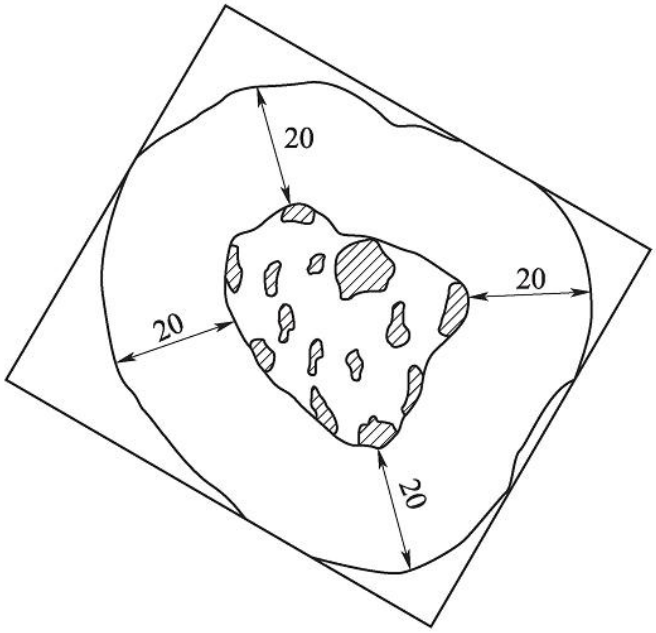

Figure 2 - Determination of the area influenced by clustered discontinuities (EN 10163-1:2004)

1.4.2.3 Remedial of Defects

(1) Defects are to be remedied by grinding and/or welding in accordance with IACS UR W11 (Reference 1.6 to this Section).

1.4.2.4 Further Defects

(1) Lamination

① Investigation to be carried out at the steelmill into the cause and extent of the detected laminations. Severe lamination is to be remedied by local insert plates. The minimum breadth or length of the plate to be replaced is to be:
(a) 1600 mm for shell and strength deck plating in way of cruciform or T-joints;
(b) 800 mm for shell, strength deck plating and other primary members;
(c) 300 mm for other structural members.

② Local limited lamination may be remedied by chipping and/or grinding followed by welding in

accordance with sketch a). In case where the local limited lamination is near the plate surface, the remedial may be carried out as shown in sketch b). For limitations see paragraph 1.4.2.2.

a) b)

(2) Weld Spatters

Loose weld spatters are to be removed by grinding or other measures to clean metal surface (see Table 1.9.13), as required by the paint system, on:

① shell plating;
② deck plating on exposed decks;
③ in tanks for chemical cargoes;
④ in tanks for fresh water and for drinking water;
⑤ in tanks for lubricating oil, hydraulic oil, including service tanks.

1.5 Gas Cutting

The roughness of the cut edges is to meet the following requirements:

1.5.1 Free Edges:

	Standard	**Limit**
Strength Members	150 μm	300 μm
Others	500 μm	1000 μm

1.5.2 Welding Edges:

	Standard	**Limit**
Strength Members	400 μm	800 μm
Others	800 μm	1500 μm

1.6 Fabrication and fairness

1.6.1 Flanged longitudinals and flanged brackets (see Table 1.6.1);
1.6.2 Built-up sections (see Table 1.6.2);
1.6.3 Corrugated bulkheads (see Table 1.6.3);
1.6.4 Pillars, brackets and stiffeners (see Table 1.6.4);
1.6.5 Maximum heating temperature on surface for line heating (see Table 1.6.5);
1.6.6 Block assembly (see Table 1.6.6);
1.6.7 Special sub-assembly (see Table 1.6.7);
1.6.8 Shape (see Table 1.6.8 and 1.6.9);
1.6.9 Fairness of plating between frames (see Table 1.6.10);
1.6.10 Fairness of plating with frames (see Table 1.6.11);
1.6.11 Preheating for welding hull steels at low temperature (see Table 1.6.12).

1.7 Alignment

1.7.1 The quality standards for alignment of hull structural components during new construction are shown in Tables 1.7.1, 1.7.2 and 1.7.3. CCS may require a closer construction tolerance in areas requiring special attention, as follows:
(1) Regions exposed to high stress concentrations;
(2) Fatigue prone areas;
(3) Detail design block erection joints;
(4) High tensile steel regions.

1.8 Welding Joint Details

Edge preparation is to be qualified in accordance with URW28 (Reference 1.10 to this Section) or other recognized standard accepted by CCS.
Some typical edge preparations are shown in Tables 1.8.1, 1.8.2, 1.8.3, 1.8.4 and 1.8.6 for reference.
1.8.1 Typical butt weld plate edge preparation (manual and semi-automatic welding) for reference − see Tables 1.8.1 and 1.8.2.
1.8.2 Typical fillet weld plate edge preparation (manual and semi-automatic welding) for reference − see

Tables 1.8.3 and 1.8.4.
1.8.3 Butt and fillet weld profile (manual and semi-automatic welding) − see Table 1.8.5.
1.8.4 Typical butt weld plate edge preparation (Automatic welding) for reference − see Table 1.8.6.
1.8.5 Distance between welds − see Table 1.8.7.

1.9 Remedial

All the major remedial work is subject to reporting by shipbuilder to CCS for approval in accordance with their work instruction for new building.
Some typical remedial works are shown in Tables 1.9.1 to 1.9.13.
1.9.1 Typical misalignment remedial − see Tables 1.9.1 to 1.9.3.
1.9.2 Typical butt weld plate edge preparation remedial (manual and semi-automatic welding) − see Tables 1.9.4 and 1.9.5.
1.9.3 Typical fillet weld plate edge preparation remedial (manual and semi-automatic welding) − see Tables 1.9.6 to 1.9.8.
1.9.4 Typical fillet and butt weld profile remedial (manual and semi-automatic welding) − see Table 1.9.9.
1.9.5 Distance between welds remedial - see Table 1.9.10.
1.9.6 Erroneous hole remedial − see Table 1.9.11.
1.9.7 Remedial by insert plate − see Table 1.9.12.
1.9.8 Weld surface remedial − see Table 1.9.13.
1.9.9 Weld remedial (short bead) − see Table 1.9.14.

Flanged Longitudinals and Flanged Brackets **Table 1.6.1**

Detail	Standard	Limit	Remark
Breadth of flange  compared to correct size	± 3 mm	± 5 mm	
Angle between flange and web  compared to template	± 3 mm	± 5 mm	per 100 mm of *a*
Straightness in plane of flange and web  	± 10 mm	± 25 mm	per 10 m

Built Up Sections **Table 1.6.2**

Detail	Standard	Limit	Remark
Frames and longitudinal 	± 1.5 mm	± 3 mm	per 100 mm of *a*
Distortion of face plate 	$d \leq 3 + a/100$ mm	$d \leq 5 + a/100$ mm	
Distortion in plane of web and flange of built up longitudinal frame, transverse frame, girder and transverse web 	± 10 mm	± 25 mm	per 10 m in length

Corrugated Bulkheads **Table 1.6.3**

Detail	Standard	Limit	Remark
Mechanical bending 	$R \geq 3t$ mm $R \geq 4.5t$ mm for CSR ships [Note 1]	$2t$ mm [Note 2]	Material to be suitable for cold flanging (forming) and welding in way of radius
Depth of corrugation 	± 3 mm	± 6 mm	
Breadth of corrugation 	± 3 mm	± 6 mm	
Pitch and depth of swedged corrugated bulkhead compared with correct value 	h : ± 2.5 mm Where it is not aligned with other bulkheads P : ± 6 mm Where it is aligned with other bulkheads P : ± 2 mm	h : ± 5 mm Where it is not aligned with other bulkheads P : ± 9 mm Where it is aligned with other bulkheads P : ± 3 mm	

Notes:

1. For CSR Bulk Carriers built under PART TEN of the Rules (2012 version) and its 2013 and 2014 amendments, the standard is $R \geq 2t$ mm.
2. For CSR ships, the allowable inside bending radius of cold formed plating may be reduced provided the following requirements are complied with.
   When the inside bending radius is reduced below 4.5 times the as-built plate thickness, supporting data is to be provided. The bending radius is in no case to be less than 2 times the as-built plate thickness. As a minimum, the following additional requirements are to be complied with:
   a) For all bent plates:
      - 100% visual inspection of the bent area is to be carried out.
      - Random checks by magnetic particle testing are to be carried out.

   b) In addition to a), for corrugated bulkheads subject to lateral liquid pressure:
      - The steel is to be of Grade D/DH or higher.

   The material is impact tested in the strain-aged condition and satisfies the requirements stated herein. The deformation is to be equal to the maximum deformation to be applied during production, calculated by the formula $t_{as\text{-}built}/(2r_{bdg} + t_{as\text{-}built})$, where $t_{as\text{-}built}$ is the as-built thickness of the plate material and r_{bdg} is the bending radius. One sample is to be plastically strained at the calculated deformation or 5%, whichever is greater and then artificially aged at 250℃ for one hour then subject to Charpy V-notch testing. The average impact energy after strain ageing is to meet the impact requirements specified for the grade of steel used.

Pillars, Brackets and Stiffeners **Table 1.6.4**

Detail	Standard	Limit	Remark
Pillar (between decks) 	4 mm	6 mm	
Cylindrical structure diameter (pillars, masts, posts, etc.) 	± *D*/200 mm max. + 5 mm	± *D*/150 mm max. 7.5 mm	
Tripping bracket and small stiffener, distortion at the part of free edge 	$a \leq t/2$ mm	t	
Ovality of cylindrical structure 		$d_{max} - d_{min} \leq 0.02 \times d_{max}$	

Maximum Heating Temperature on Surface for Line Heating **Table 1.6.5**

Item		Standard	Limit	Remark
Conventional Process AH32-EH32 & AH36-EH36	Water cooling just after heating	Under 650℃		
	Air cooling after heating	Under 900℃		
TMCP type AH36-EH36 (C_{eq}. > 0.38%)	Air cooling and subsequent water cooling after heating	Under 900 ℃ (starting temperature of water cooling to be under 500℃)		
TMCP type AH32-DH32 & AH36-DH36 (C_{eq}. ≤ 0.38%)	Water cooling just after heating or air cooling	Under 1000℃		
TMCP type EH32 & EH36 (C_{eq}. ≤ 0.38%)	Water cooling just after heating or air cooling	Under 900℃		
Note: $C_{eq} = \mathrm{C} + \frac{\mathrm{Mn}}{6} + \frac{\mathrm{Cr}+\mathrm{Mo}+\mathrm{V}}{5} + \frac{\mathrm{Ni}+\mathrm{Cu}}{15}(\%)$				

Block Assembly **Table 1.6.6**

Item	Standard	Limit	Remark
Flat Plate Assembly Length and Breadth Distortion Squareness Deviation of interior members from plate	 ± 4 mm ± 10 mm ± 5 mm 5 mm	 ± 6 mm ±20 mm ±10 mm 10 mm	
Curved plate assembly Length and Breadth Distortion Squareness Deviation of interior members from plate	 ± 4 mm ± 10 mm ± 10 mm 5 mm	 ± 8 mm ± 20 mm ± 15 mm 10 mm	measured along the girth
Flat cubic assembly Length and Breadth Distortion Squareness Deviation of interior members from plate Twist Deviation between upper and lower plate	 ± 4 mm ± 10 mm ± 5 mm 5 mm ± 10 mm ± 5 mm	 ± 6 mm ± 20 mm ± 10 mm 10 mm ± 20 mm ± 10 mm	
Curved cubic assembly Length and Breadth Distortion Squareness Deviation of interior members from plate Twist Deviation between upper and lower plate	 ± 4 mm ± 10 mm ± 10 mm ± 5 mm ± 15 mm ± 7 mm	 ± 8 mm ± 20 mm ± 15 mm ± 10 mm ± 25 mm ± 15 mm	measured along with girth

Special Sub-Assembly **Table 1.6.7**

Item	Standard	Limit	Remark
Distance between upper/lower gudgeon	± 5 mm	± 10 mm	
Distance between aft edge of boss and aft peak bulkhead	± 5 mm	± 10 mm	
Twist of sub-assembly of stern frame	5 mm	10 mm	
Deviation of rudder from shaft center line	4 mm	8 mm	
Twist of rudder plate	6 mm	10 mm	
Flatness of top plate of main engine bed	5 mm	10 mm	
Breadth and length of top plate of main engine bed	± 4 mm	± 6 mm	
Note: Dimensions and tolerances have to fulfill engine and equipment manufacturers' requirements, if any.			

Shape **Table 1.6.8**

Detail	Standard	Limit	Remark
Deformation for the whole length 	± 50 mm		per 100 m against the line of keel sighting
Deformation for the distance between two adjacent bulkheads 	± 15 mm		
Cocking-up of fore body 	± 30 mm		The deviation is to be measured from the design line
Cocking-up of aft-body 	± 20 mm		
Rise of floor amidships 	± 15 mm		The deviation is to be measured from the design line

Shape **Table 1.6.9**

Item	Standard	Limit	Remark
Length between perpendiculars	±*L*/1000 mm where *L* is in mm		Applied to ships of 100 m length and above. For the convenience of the measurement the point where the keel is connected to the curve of the stem may be substituted for the fore perpendicular in the measurement of the length
Moulded breadth at midship	±*B*/1000 mm where *B* is in mm		Applied to ships of 15 m breadth and above, measured on the upper deck
Moulded depth at midship	±*D*/1000 mm where *D* is in mm		Applied to ships of 10 m depth and above, measured up to the upper deck

Fairness of Plating Between Frames **Table 1.6.10**

Item		Standard	Limit	Remark
Shell plate	Parallel part (side & bottom shell)	4 mm	8 mm		Fore and aft part	5 mm		
Tank top plate		4 mm		
Bulkhead	Longl. Bulkhead Trans. Bulkhead Swash Bulkhead	6 mm		
Strength deck	Parallel part	4 mm	8 mm	
	Fore and aft part Covered part	6 mm 7 mm	9 mm 9 mm	
Second deck	Bare part	6 mm	8 mm	
	Covered part	7 mm	9 mm	
Forecastle deck poop deck	Bare part	4 mm	8 mm	
	Covered part	6 mm	9 mm	
Super structure deck	Bare part	4 mm	6 mm	
	Covered part	7 mm	9 mm	
House wall	Outside wall	4 mm	6 mm	
	Inside wall	6 mm	8 mm	
	Covered part	7 mm	9 mm	
Interior member (web of girder, etc.)		5 mm	7 mm	
Floor and girder in double bottom		5 mm	8 mm	

Fairness of Plating with Frames **Table 1.6.11**

Item		Standard	Limit	Remark
Shell plate	Parallel part	± 2 *l* /1000 mm	± 3 *l* /1000 mm	*l* = span of frame (mm) To be measured between on trans. space (min. *l* = 3000 mm)
	Fore and aft part	± 3 *l* /1000 mm	± 4 *l* /1000 mm	
Strength deck (excluding cross deck) and top plate of double bottom	–	± 3 *l* /1000 mm	± 4 *l* /1000 mm	
Bulkhead	–		± 5 *l* /1000 mm	
Accommodation above the strength deck and others	–	± 5 *l* /1000 mm	± 6 *l* /1000 mm	
 *l* = span of frame (minimum *l* = 3000 mm)  To be measured between one trans. space				

Preheating for welding hull steels at low temperature **Table 1.6.12**

Item		Standard		Limit	Remark
		Base metal temperature needed preheating	Minimum preheating temperature		
Normal strength steels	A, B, D, E	Below -5℃	20℃ [1)]		
Higher strength steels (TMCP type)	AH32 – EH32 AH36 – EH36	Below 0℃			
Higher strength steels (Conventional type)		Below 0℃			
Note: 1) This level of preheat is to be applied unless the approved welding procedure specifies a higher level.					

Alignment **Table 1.7.1**

Detail	Standard	Limit	Remark
Alignment of butt welds 		$a \le 0.15t$ strength member $a \le 0.2t$ other but maximum 4.0 mm	t is the lesser plate thickness
Alignment of fillet welds 		Strength member and higher stress member: $a \le t_1/3$ Other: $a \le t_1/2$	Alternatively, heel line can be used to check the alignment. Where t_3 is less than t_1, then t_3 should be substituted for t_1 in the standard
Alignment of fillet welds 		Strength member and higher stress member: $a \le t_1/3$ Other: $a \le t_1/2$	Alternatively, heel line can be used to check the alignment. Where t_3 is less than t_1, then t_3 should be substitute for t_1 in the standard

Alignment **Table 1.7.2**

Detail	Standard	Limit	Remark
Alignment of flange of T-longitudinal  *b* (mm)	Strength member $a \le 0.04b$ (mm)	a = 8.0 mm	
Alignment of height of T-bar, L-angle bar or bulb  	Strength member: $a \le 0.15t$ Other: $a \le 0.20t$	a = 3.0 mm	
Alignment of panel stiffener  	$d \le L/50$		
Gap between bracket/intercostal and stiffener  	$a \le 2.0$ mm	a = 3.0 mm	
Alignment of lap welds  	$a \le 2.0$ mm	a = 3.0 mm	

Alignment **Table 1.7.3**

Detail	Standard	Limit	Remark
Gap between beam and frame 	$a \leq 2.0$ mm	$a = 5.0$ mm	
Gap around stiffener cut-out 	$s \leq 2.0$ mm	$s = 3.0$ mm	

Typical Butt Weld Plate Edge Preparation
(Manual Welding and Semi-Automatic Welding) for Reference **Table 1.8.1**

Detail	Standard	Limit	Remark
Square butt $t \le 5$ mm 	$G \le 3$ mm	$G = 5$ mm	see Note 1
Single bevel butt $t > 5$ mm 	$G \le 3$ mm	$G = 5$ mm	see Note 1
Double bevel butt $t > 19$ mm 	$G \le 3$ mm	$G = 5$ mm	see Note 1
Double Vee butt, uniform bevels 	$G \le 3$ mm	$G = 5$ mm	see Note 1
Double Vee butt, non-uniform bevel 	$G \le 3$ mm	$G = 5$ mm	see Note 1

Note 1:
Different plate edge preparation may be accepted or approved by CCS in accordance with UR W28 (Reference 1.10 to this Section) or other recognized standard accepted by CCS.
For welding procedures other than manual welding, see paragraph 1.3.2 Qualification of weld procedures.

Typical Butt Weld Plate Edge Preparation
(Manual Welding and Semi-Automatic Welding) for Reference **Table 1.8.2**

Detail	Standard	Limit	Remark
Single Vee butt, one side welding with backing strip (temporary or permanent) 	G = 3 to 9 mm	G = 16 mm	see Note 1
Single Vee butt 	$G \leq 3$ mm	G = 5 mm	see Note 1

Note 1:
Different plate edge preparation may be accepted or approved by CCS in accordance with UR W28 (Reference 1.10 to this Section) or other recognized standard accepted by CCS.
For welding procedures other than manual welding, see paragraph 1.3.2 Qualification of welding procedures.

Typical Fillet Weld Plate Edge Preparation
(Manual Welding and Semi-Automatic Welding) for Reference **Table 1.8.3**

Detail	Standard	Limit	Remark
Tee Fillet 	$G \leq 2$ mm	$G = 3$ mm	see Note 1
Inclined fillet 	$G \leq 2$ mm	$G = 3$ mm	see Note 1
Single bevel tee with permanent backing 	$G \leq 4$ to 6 mm $\theta° = 30°$ to $45°$	$G = 16$ mm	Not normally for strength member see also Note 1
Single bevel tee 	$G \leq 3$ mm		see Note 1

Note 1:
Different plate edge preparation may be accepted or approved by CCS in accordance with UR W28 (Reference 1.10 to this Section) or other recognized standard accepted by CCS.
For welding procedures other than manual welding, see paragraph 1.3.2 Qualification of welding procedures.

Typical Fillet Weld Plate Edge Preparation
(Manual Welding and Semi-Automatic Welding) for Reference **Table 1.8.4**

Detail	Standard	Limit	Remark
Single 'J' bevel tee 	G = 2.5 to 4 mm		see Note 1
Double bevel tee symmetrical t > 19 mm 	$G \leq 3$ mm		see Note 1
Double bevel tee asymmetrical t > 19 mm 	$G \leq 3$ mm		see Note 1
Double 'J' bevel tee symmetrical 	G = 2.5 to 4 mm		see Note 1

Note 1:
Different plate edge preparation may be accepted or approved by CCS in accordance with UR W28 (Reference 1.10 to this Section) or other recognized standard accepted by CCS.
For welding procedures other than manual welding, see paragraph 1.3.2 Qualification of welding procedures.

Butt And Fillet Weld Profile
(Manual Welding and Semi-Automatic Welding) **Table 1.8.5**

Detail	Standard	Limit	Remark
Butt weld toe angle 	$\theta \leq 60°$ $h \leq 6$ mm	$\theta \leq 90°$	
Butt weld undercut 		$D \leq 0.5$ mm for strength member $D \leq 0.8$ mm for other	
Fillet weld leg length  s = leg length; a = throat thickness		$s \geq 0.9s_d$ $a \geq 0.9a_d$ over short weld lengths	s_d = design s a_d = design a
Fillet weld toe angle 		$\theta \leq 90°$	In areas of stress concentration and fatigue, CCS may require a lesser angle
Fillet weld undercut 		$D \leq 0.8$ mm	

Typical Butt Weld Plate Edge Preparation (Automatic welding) for Reference **Table 1.8.6**

Detail	Standard	Limit	Remark
Submerged Arc Welding (SAW) 	$0 \le G \le 0.8$ mm	$G = 2$ mm	See Note 1

Note 1:
Different plate edge preparation may be accepted or approved by CCS in accordance with UR W28 (Reference 1.10 to this Section) or other recognized standard accepted by CCS.
For welding procedures other than manual welding, see paragraph 1.3.2 Qualification of welding procedures.

Distance Between Welds **Table 1.8.7**

Detail	Standard	Limit	Remark
Scallops over weld seams 		for strength member $d \ge 5$ mm for other $d \ge 0$ mm	The "*d*" is to be measured from the toe of the fillet weld to the toe of the butt weld
Distance between two butt welds 		$d \ge 0$ mm	
Distance between butt weld and fillet weld 		for strength member: $d \ge 10$ mm for other: $d \ge 0$ mm	The "*d*" is to be measured from the toe of the fillet weld to the toe of the butt weld
Distance between butt welds 	for cut-outs $d \ge 30$ mm		
	for margin plates d ≥ 300 mm	150 mm	

Typical Misalignment Remedial **Table 1.9.1**

Detail	Remedial Standard	Remark
Alignment of butt joints 	Strength member $a > 0.15t_1$ or $a > 4$ mm release and adjust Other $a > 0.2t_1$ or $a > 4$ mm release and adjust	t_1 is lesser plate thickness
Alignment of fillet welds  $t_1 < t_2$	Strength member and higher stress member $t_1/3 < a \leq t_1/2$ − generally increase weld throat by 10% $a > t_1/2$ −release and adjust over a minimum of $50a$ Other $a > t_1/2$ −release and adjust over a minimum of $30a$	Alternatively, heel line can be used to check the alignment Where t_3 is less than t_1 then t_3 should be substituted for t_1 in standard
Alignment of flange of T-longitudinal 	When $0.04b < a \leq 0.08b$, max 8 mm: grind corners to smooth taper over a minimum distance $L = 3a$ When $a > 0.08$b or 8 mm: release and adjust over a minimum distance $L = 50a$	
Alignment of height of T-bar, L-angle bar or bulb 	When 3 mm $< a \leq 6$ mm: build up by welding When $a > 6$ mm: release and adjust over minimum $L = 50a$ for strength member and $L = 30a$ for other 	
Alignment of lap welds 	3 mm $< a \leq 5$ mm: weld leg length to be increased by the same amount as increase in gap in excess of 3 mm $a > 5$ mm: members to be re-aligned	

Typical Misalignment Remedial **Table 1.9.2**

Detail	Remedial Standard	Remark
Gap between bracket/intercostal and stiffener 	When 3 mm < a ≤ 5 mm: weld leg length to be increased by increase in gap in excess of 3 mm	
	When 5 mm < a ≤ 10 mm: chamfer 30° to 40° and build up by welding with backing	
	When a > 10 mm: increase gap to about 50 mm and fit collar plate  $t \geqslant t_1$ $b = (2t + 25)$ mm, min. 50 mm	
Gap between beam and frame 	3 mm < a ≤ 5 mm: weld leg length to be increased by the same amount as increase in gap in excess of 3 mm a > 5 mm release and adjust	

Misalignment Remedial **Table 1.9.3**

<table>

Typical Butt Weld Plate Edge Preparation Remedial
(Manual Welding and Semi-Automatic Welding) **Table 1.9.5**

Detail	Remedial Standard	Remark
Single Vee butt, one side welding  	When 5 mm < G ≤ 1.5t mm (maximum 25 mm), build up gap with welding on one or both edges, to "Limit" gap size preferably to "Standard" gap size as described in Table 1.8.2 Where a backing strip is used, the backing strip is to be removed, the weld back gouged, and a sealing weld made Different welding arrangement by using backing material approved by CCS may be accepted on the basis of an appropriate welding procedure specification  	
Single Vee butt  	When G > 25 mm or 1.5t, whichever is smaller, use insert plate of minimum width 300 mm  	

Typical Fillet Weld Plate Edge Preparation Remedial
(Manual Welding and Semi-Automatic Welding) **Table 1.9.6**

Detail	Remedial standard	Remark
Tee Fillet 	3 mm < G ≤ 5 mm – leg length increased to Rule leg + (G-2)	
	5 mm < G ≤ 16 mm or G ≤ 1.5t - chamfer by 30° to 45°, build up with welding, on one side, with backing strip if necessary, grind and weld. 	
	G > 16 mm or G > 1.5t use insert plate of minimum width 300 mm 	
Liner treatment 	$t_2 \le t \le t_1$ $G \le 2$ mm a = 5 mm + fillet leg length	Not to be used in cargo area or areas of tensile stress through the thickness of the liner

Typical Fillet Weld Plate Edge Preparation Remedial
(Manual Welding and Semi-Automatic Welding) **Table 1.9.7**

Detail	Remedial standard	Remark
Single bevel tee 	3 mm < G ≤ 5 mm build up weld	
	5 mm < G ≤ 16 mm - build up with welding, with backing strip if necessary, remove backing strip if used, back gouge and back weld 	
	G > 16 mm new plate to be inserted of minimum width 300 mm 	

Typical Fillet Weld Plate Edge Preparation Remedial
(Manual Welding and Semi-Automatic Welding) **Table 1.9.8**

Detail	Remedial standard	Remark
Single 'J' bevel tee 	As single bevel tee	
Double bevel tee symmetrical 	When 5 mm < $G \leq$ 16 mm build up with welding using ceramic or other approved backing bar, remove, back gouge and back weld.  When G > 16 mm-insert plate of minimum height 300 mm to be fitted. 	
Double bevel tee asymmetrical 		
Double 'J' bevel symmetrical 		

Typical Fillet and Butt Weld Profile Remedial
(Manual Welding and Semi-Automatic Welding) **Table 1.9.9**

Detail	Remedial standard	Remark
Fillet weld leg length 	Increase leg or throat by welding over	Minimum short bead to be referred to Table 1.9.14
Fillet weld toe angle 	θ> 90° grinding, and welding, where necessary, to make $\theta \leq 90°$	
Butt weld toe angle 	θ> 90° grinding, and welding, where necessary, to make $\theta \leq 90°$	
Butt weld undercut 	For strength member, where $0.5 < D \leq 1$ mm, and for other, where $0.8 < D \leq 1$ mm, undercut to be ground smooth (localized only) or to be filled by welding Where $D > 1$ mm undercut to be filled by welding	
Fillet weld undercut 	Where $0.8 < D \leq 1$ mm undercut to be ground smooth (localized only) or to be filled by welding Where $D > 1$ mm undercut to be filled by welding	

Distance Between Welds Remedial **Table 1.9.10**

Detail	Remedial standard	Remark
Scallops over weld seams 	Hole to be cut and ground smooth to obtain distance	

Erroneous Hole Remedial **Table 1.9.11**

Detail	Remedial standard	Remark
Holes made erroneously $D < 200$ mm 	Strength member open hole to minimum 75 mm dia., fit and weld spigot piece  $\theta = 30^\circ - 40^\circ$ $G = 4 - 6$ mm $1/2t = t_1 = t$ $l = 50$ mm Or open hole to over 300 mm and fit insert plate	Fillet weld to be made after butt weld The fitting of spigot pieces in areas of high stress concentration or fatigue is to be approved by CCS.
	Other open hole to over 300 mm and fit insert plate or fit lap plate  $t_1 = t_2$ $L = 50$ mm, min	
Holes made erroneously $D \geq 200$ mm 	Strength member open hole and fit insert plate	
	Other open hole to over 300 mm and fit insert plate or fit lap plate  $t_1 = t_2$ $L = 50$ mm, min	

Remedial by Insert Plate **Table 1.9.12**

Detail	Remedial standard	Remark
Remedial by insert plate   	L = 300 mm minimum B = 300 mm minimum $R = 5t$ mm 100 mm minimum (1) seam with insert piece is to be welded first (2) original seam is to be released and welded over for a minimum of 100 mm.	
Remedial of built section by insert plate   	$L_{min} \geq 300$ mm Welding sequence (1) → (2) → (3) → (4) Web butt weld scallop to be filled during final pass (4)	

Weld Surface Remedial **Table 1.9.13**

Detail	Remedial standard	Remark
Weld spatter 	1. Remove spatter observed before blasting with scraper or chipping hammer, etc. 2. For spatter observed after blasting: a) remove with a chipping hammer, scraper, etc. b) for spatter not easily removed with a chipping hammer, scraper, etc., grind the sharp angle of spatter to make it obtuse	In principle, no grinding is applied to weld surface
Arc strike (HT steel, Cast steel, Grade E of mild steel, TMCP type HT steel, Low temp steel)	Remove the hardened zone by grinding or other measures such as overlapped weld bead etc.	Minimum short bead to be referred to Table 1.9.14

Welding Remedial by Short Bead **Table 1.9.14**

Detail	Remedial standard	Remark
Short bead for remedying scar (scratch)	a) HT steel, Cast steel, TMCP type HT steel (C_{eq} > 0.36%) and Low temp steel (C_{eq} > 0.36%) Length of short bead ≥ 50 mm b) Grade E of mild steel Length of short bead ≥ 30 mm c) TMCP type HT steel (C_{eq} ≤ 0.36%) and Low temp steel (C_{eq} ≤ 0.36%) Length of short bead ≥ 10 mm	Preheating is necessary at 100 ± 25℃
Remedying weld bead	a) HT steel, Cast steel, TMCP type HT steel (C_{eq} > 0.36%) and Low temp steel (C_{eq} > 0.36%) Length of short bead ≥ 50 mm b) Grade E of mild steel Length of short bead ≥ 30 mm c) TMCP type HT steel (C_{eq} ≤ 0.36%) and Low temp steel (C_{eq} ≤ 0.36%) Length of short bead ≥ 30 mm	

Notes:
1. When short bead is made erroneously, remove the bead by grinding.
2. $C_{eq} = \mathrm{C} + \frac{\mathrm{Mn}}{6} + \frac{\mathrm{Cr} + \mathrm{Mo} + \mathrm{V}}{5} + \frac{\mathrm{Ni} + \mathrm{Cu}}{15}(\%)$

Standards
1 EN 10163-1:2004 Delivery requirements for surface condition of hot-rolled steel plates, wide flats and sections – Part 1: General requirements

2 Repair Quality Standard for Existing Ships

2.1 Scope

2.1.1 This standard provides guidance on quality of repair of hull structures. The standard covers permanent repairs of existing ships.

2.1.1.1 Whereas the standard generally applies to:

(1) conventional ship types;

(2) parts of hull covered by the rules of CCS;

(3) hull structures constructed from normal and higher strength hull structural steel, the applicability of the standard is in each case to be agreed upon by CCS.

2.1.1.2 The standard does generally not apply to repair of

(1) special types of ships as e.g. gas tankers;

(2) structures fabricated from stainless steel or other, special types or grades of steel.

2.1.2 The standard covers typical repair methods and gives guidance on quality standard on the most important aspects of such repairs. Unless explicitly stated elsewhere in the standard, the level of workmanship reflected herein will in principle be acceptable for primary and secondary structure of conventional design. A more stringent standard may however be required for critical and highly stressed areas of the hull, and is to be agreed with CCS in each case. In assessing the criticality of hull structure and structural components, reference is made to References 2.l, 2.2, 2.3, 2.6, 2.8, 2.9, 2.10 and 2.11 to this Section.

2.1.3 Restoration of structure to the original standard may not constitute durable repairs of damages originating from insufficient strength or inadequate detail design. In such cases strengthening or improvements beyond the original design may be required. Such improvements are not covered by this standard, however it is referred to References 2.l, 2.2, 2.3, 2.6, 2.8, 2.9, 2.10 and 2.11 to this Section.

2.1.4 IACS UR W33 (Reference 2.8) scope is for new construction only, however, for the purpose of NDT applicability within this Appendix, UR W33 may be used as reference for NDT methods and acceptance standards.

2.2 General requirements for repairs and repairers

2.2.1 In general, when hull structure covered by classification is to be subjected to repairs, the work is to be carried out under the supervision of the Surveyor to CCS. Such repairs are to be agreed prior to commencement of the work.

2.2.2 Repairs are to be carried out by workshops, repair yards or personnel who have demonstrated their capability to carry out hull repairs of adequate quality in accordance with CCS requirements and this standard.

2.2.3 Repairs are to be carried out under working conditions that facilitate sound repairs. Provisions are to be made for proper accessibility, staging, lighting and ventilation. Welding operations are to be carried out under shelter from rain, snow and wind.

2.2.4 Welding of hull structures is to be carried out by qualified welders, according to approved and qualified welding procedures and with welding consumables approved by CCS, see Section 2.3. Welding operations are to be carried out under proper supervision of the repair yard.

2.2.5 Where repairs to hull which affect or may affect classification are intended to be carried out during a voyage, complete repair procedure including the extent and sequence of repair is to be submitted to and agreed upon by the Surveyor to CCS reasonably in advance of the repairs. See Reference 2.7 to this Section.

2.3 Qualification of personnel

2.3.1 Qualification of welders

2.3.1.1 Welders are to be qualified in accordance with IACS UR W32 (Reference 2.13) or to a recognised national or international standard, e.g. ISO 9606-1:2012/COR2:2013, ASME BPVC, Section IX:2019, ANSI/AWS D1.1:2020. Recognition of other standards is subject to submission to CCS for evaluation. Repair yards and workshops are to keep records of welders qualification and, when required, furnish valid approval test certificates.

2.3.1.2 Welding operators using fully mechanised of fully automatic processes need generally not pass approval testing, provided that production welds made by the operators are of the required quality. However, operators are to receive adequate training in setting or programming and operating the equipment. Records of training and production test results shall be maintained on individual operator’s files and records, and be made available to CCS for inspection when requested.

2.3.2 Qualification of welding procedures

2.3.2.1 Welding procedures are to be qualified in accordance with IACS UR W28 (Reference 2.12) or a recognised national or international standard, e.g. EN ISO 15607:2019, ISO 15614-1:2017, ASME BPVC, Section IX:2019, ANSI/AWS D1.1:2020. Recognition of other standards is subject to submission to CCS for evaluation. The welding procedure should be supported by a welding procedure qualification record. The specification is to include the welding process, types of electrodes, weld shape, edge preparation, welding techniques and positions.

2.3.3 Qualification of NDT operators

2.3.3.1 Personnel performing non-destructive testing for the purpose of assessing quality of welds in connection with repairs covered by this standard, are to be qualified in accordance with CCS rules or to a recognised international or national qualification scheme. Records of operators and their current certificates are to be kept and made available to the Surveyor for inspection.

2.4 Materials

2.4.1 General requirements for materials

2.4.1.1 The requirements for materials used in repairs are in general the same as the requirements for materials specified in CCS rules for new constructions, (see Reference 2.4 to this Section).

2.4.1.2 Replacement material is in general to be of the same grade as the original approved material. Alternatively, material grades complying with recognised national or international standards may be accepted by CCS provided such standards give equivalence to the requirements of the original grade or are agreed by CCS. For assessment of equivalency between steel grades, the general requirements and guidelines in Section 2.4.2 apply.

2.4.1.3 Higher tensile steel is not to be replaced by steel of a lesser strength unless specially approved by CCS.

2.4.1.4 Normal and higher strength hull structural steels are to be manufactured at works approved by CCS for the type and grade being supplied.

2.4.1.5 Materials used in repairs are to be certified by CCS applying the procedures and requirements in the rules for new constructions. In special cases, and normally limited to small quantities, materials may be accepted on the basis of alternative procedures for verification of the material's properties. Such procedures are subject to agreement by CCS in each separate case.

2.4.2 Equivalency of material grades

2.4.2.1 Assessment of equivalency between material grades should at least include the following aspects:

(1) heat treatment/delivery condition;

(2) chemical composition;

(3) mechanical properties;

(4) tolerances.

2.4.2.2 When assessing the equivalence between grades of normal or higher strength hull structural steels up to and including grade E40 in thickness limited to 50 mm, the general requirements in Table 2.4.1 apply.

2.4.2.3 Guidance on selection of steel grades to certain recognised standards equivalent to hull structural steel grades specified in CCS rules is given in Table 2.4.2.

Minimum extent and requirements to assessment of equivalency between normal or higher strength hull structural steel grades **Table 2.4.1**

Items to be considered	Requirements	Comments
Chemical composition	− C; equal or lower − P and S; equal or lower − Mn; approximately the same but not exceeding 1.6% − Fine grain elements; in same amount − Detoxidation practice	The sum of the elements, e.g. Cu, Ni, Cr and Mo should not exceed 0.8%
Mechanical properties	− Tensile strength; equal or higher	Actual yield strength should not exceed CCS Rule minimum requirements by more than 80 N/mm^2
	− Yield strength; equal or higher	
	− Elongation; equal or higher	
	− Impact energy; equal or higher at same or lower temperature, where applicable	
Condition of supply	− Same or better	Heat treatment in increasing order: − as rolled (AR) − controlled rolled (CR) − normalised (N) − thermo-mechanically rolled (TM)[1)] − quenched and tempered (QT)[1)]

		[1)] TM- and QT-steels are not suitable for hot forming
Tolerances	− Same or stricter	Permissible under thickness tolerances: − plates: 0.3 mm − sections: according to recognised standards

Guidance on steel grades comparable to the normal and high strength hull structural steel grades given in CCS rules **Table 2.4.2**

Steel grades according to CCS rules (Reference 2.4 to this Section)							Comparable steel grades (1)

Notes:
(1) In selecting comparable steels from this table, attention should be given to the requirements of Table 2.4.1 and the dimension requirements of the product with respect to CCS rules. Some steel grades as per national or international standard are defined with specified yield and tensile strength properties which depend on thickness. For thicknesses with tensile properties specified lower than those of CCS Rules, case-by-case consideration is to be given with regards to design requirements.
(2) EN 10025:1990 is superseded by EN10025 series: 2019 (e.g. EN 10025-2:2019, EN 10025-3:2019, EN 10025-4:2019).

2.5 General requirements to welding

2.5.1 Correlation of welding consumables with hull structural steels

2.5.1.1 For the different hull structural steel grades welding consumables are to be selected in accordance with IACS UR W17 (see Reference 2.5 to this Section).

2.5.2 General requirements to preheating and drying out

2.5.2.1 The need for preheating is to be determined based on the chemical composition of the materials, welding process and procedure and degree of joint restraint.

2.5.2.2 A minimum preheat of 50℃ is to be applied when ambient temperature is below 0℃. Dryness of the welding zone is in all cases to be ensured.

2.5.2.3 Guidance on recommended minimum preheating temperature for higher strength steel is given in Table 2.5.1. For automatic welding processes utilising higher heat input e.g. submerged arc welding, the temperatures may be reduced by 50℃. For re-welding or repair of welds, the stipulated values are to be increased by 25℃.

Preheating temperature **Table 2.5.1**

Carbon equivalent 1)	Recommended minimum preheat temperature (℃)		
	t_{comb} ≤ 50 mm 2)	50 mm < t_{comb} ≤ 70 mm 2)	t_{comb} > 70 mm 2)
C_{eq} ≤ 0.39			50
C_{eq} ≤ 0.41			75
C_{eq} ≤ 0.43		50	100
C_{eq} ≤ 0.45	50	100	125
C_{eq} ≤ 0.47	100	125	150
C_{eq} ≤ 0.50	125	150	175

Notes:

1) $C_{eq} = \mathrm{C} + \frac{\mathrm{Mn}}{6} + \frac{\mathrm{Cr} + \mathrm{Mo} + \mathrm{V}}{5} + \frac{\mathrm{Ni} + \mathrm{Cu}}{15}(\%)$

2) Combined thickness $t_{comb} = t_1+t_2+t_3+t_4$, see Figure 2.5.2.

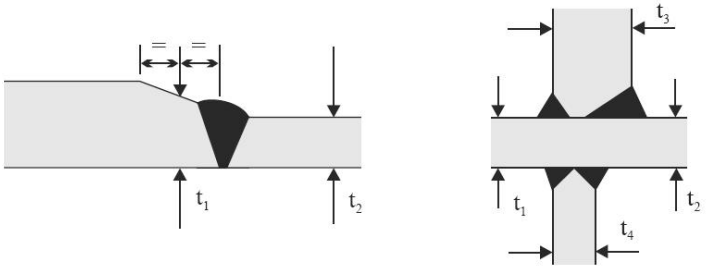

Figure 2.5.2 Combined thickness

2.5.3 Dry welding on hull plating below the waterline of vessels afloat

2.5.3.1 Welding on hull plating below the waterline of vessels afloat is acceptable only on normal and higher strength steels with specified yield strength not exceeding 355 MPa and only for local repairs. Welding involving other high strength steels or more extensive repairs against water backing is subject to special consideration and approval by CCS of the welding procedure.

2.5.3.2 Low-hydrogen electrodes or welding processes are to be used when welding on hull plating against water backing. Coated low-hydrogen electrodes used for manual metal arc welding should be properly conditioned to ensure a minimum of moisture content.

2.5.3.3 In order to ensure dryness and to reduce the cooling rate, the structure is to be preheated by a torch or similar prior to welding, to a temperature of minimum 5℃ or as specified in the welding procedure.

2.6 Repair quality standard

2.6.1 Welding, general requirements

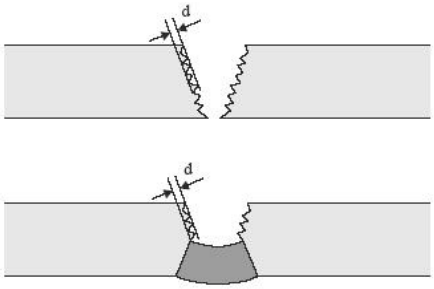

Figure 2.6.1 Groove roughness

Table 2.6.1

Item	Standard	Limit	Remark
Material Grade	Same as original or higher		See Section 2.4
Welding Consumables	IACS UR W17 (Reference 2.5 to this Section)	Approval according to equivalent international standard	
Groove / Roughness	See note and Figure 2.6.1	d < 1.5 mm	Grind smooth
Pre-Heating	See Table 2.5.1	Steel temperature not lower than 5℃	
Welding with water on the outside	See Section 2.5.3	Acceptable for normal and high strength steels	− Moisture to be removed by a heating torch
Alignment	As for new construction		
Weld Finish	IACS UR W33 (Reference 2.8 to this Section)		
NDT	IACS UR W33 (Reference 2.8 to this Section)	At random with extent to be agreed with attending surveyors	

Note: Slag, grease, loose mill scale, rust and paint, other than primer, to be removed.

2.6.2 Renewal of plates

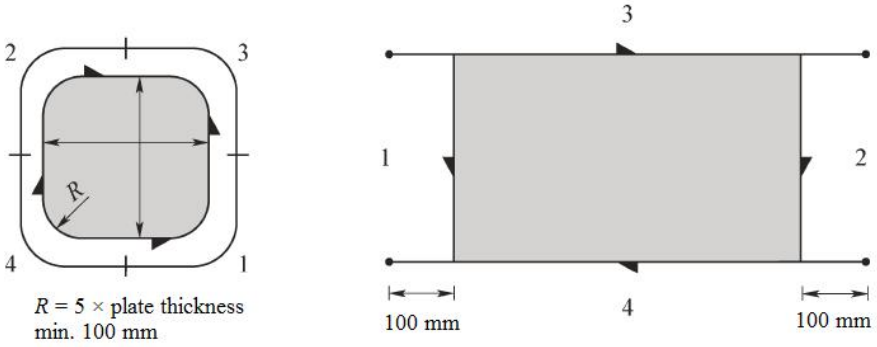

Figure 2.6.2 Welding sequence for inserts

Table 2.6.2

Item	Standard	Limit	Remark
Size Insert	Min 300 × 300 mm R = 5 × thickness Circular inserts: *Dmin* = 200 mm	Min 200 × 200 mm Min R = 100 mm	
Material Grade	Same as original or higher		See Section 2.4
Edge Preparation	As for new construction		In case of non-compliance increase the amount of NDT
Welding Sequence	See Figure 2.6.2, welding sequence: 1 → 2 → 3 → 4		For primary members sequence 1 and 2 transverse to the main stress direction
Alignment	As for new construction		
Weld Finish	IACS UR W33 (Reference 2.8 to this Section)		
NDT	IACS UR W33 (Reference 2.8 to this Section)		

2.6.3 Doublers on plating

Local doublers are normally only allowed as temporary repairs, except as original compensation for openings, within the main hull structure.

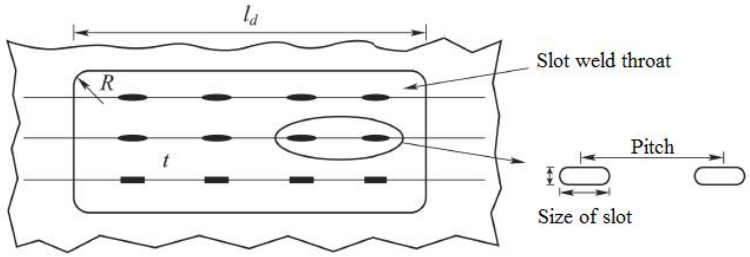

Figure 2.6.3 Doublers on plates

Table 2.6.3

Item	Standard	Limit	Remark
Existing Plating		General:： $t \geq 5$ mm	For areas where existing plating is less than 5 mm plating a permanent repair by insert is to be carried out
Extent / Size	Rounded off corners.	Min 300 × 300 mm $R \geq 50$ mm	
Thickness of Doubler (t_d)	$t_d \leq t_p$ (t_p = original thickness of existing plating)	$t_d > t_p/3$	
Material Grade	Same as original plate		See Section 2.4
Edge Preparation	As for [newbuilding] new construction		Doublers welded on primary strength members: (L_e: leg length) when $t > L_e + 5$ mm, the edge to be tapered (1:4)
Welding	As for [newbuilding]		Welding sequence similar to insert

Item	Standard	Limit	Remark
	new construction		plates
Weld Size (throat thicknesss))	Circumferential and in slots: $0.6 \times t_d$		
Slot Welding	Normal size of slot: (80-100) × 2 t_d Distance from doubler edge and between slots: $d \leq 15\ t_d$	Max pitch between slots 200 mm d_{max} = 500 mm	For doubler extended over several supporting elements, see Figure 2.6.3
NDT	IACS UR W33 (Reference 2.8 to this Section)		

2.6.4 Renewal of internals/stiffeners

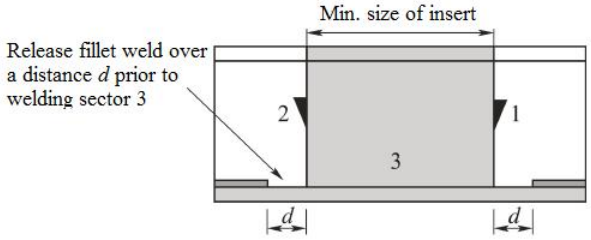

Figure 2.6.4 Welding sequence for inserts of stiffeners

Table 2.6.4

Item	Standard	Limit	Remark
Size Insert	Min. 300 mm	Min 200 mm	
Marterial Grade	Same as original or higher		See Section 2.4
Edge Preparation	As for new construction. Fillet weld stiffener web / plate to be released over min. d = 150 mm		
Welding Sequence	See Figure 2.6.4 Welding sequence is 1→2→3		
Alignment	As for new construction		
Weld Finish	IACS UR W33 (Reference 2.8 to this Section)		
NDT	IACS UR W33 (Reference 2.8 to this Section)		

2.6.5 Renewal of internals/stiffeners – transitions inverted angle/bulb profile

The application of the transition is allowed for secondary structural elements.

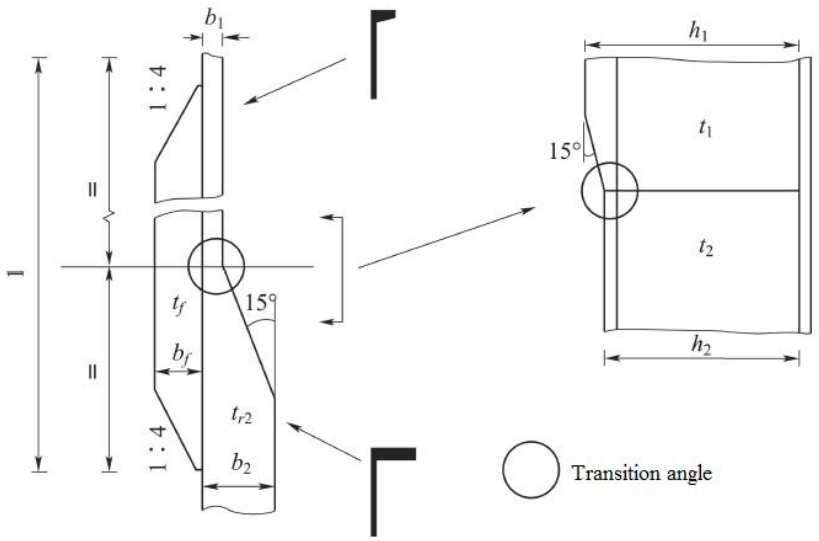

Figure 2.6.5 Transition between inverted angle and bulb profile

Table 2.6.5

Item	Standard	Limit	Remark
$(h_1 - h_2)$	$\leq 0.25 \times b_1$		
$\lvert t_1 - t_2 \rvert$	2 mm		Without tapering transition
Transition Angle	15 degrees		At any arbitrary section
Flanges	$t_f = t_{f2}$ $b_f = b_{f2}$		
Length of Flatbar	$4 \times h_1$		
Material			See Section 2.4

2.6.6 Application of Doubling Straps

2.6.6.1 In certain instances, doubling straps are used as a means to strengthen and reinforce primary structure. Where this has been agreed and approved, particular attention should be paid to:

(1) the end termination points of the straps, so that toe support is such that no isolated hard point occurs;

(2) in the case of application of symmetrical or asymmetrical-ended straps, the corners at the end of the tapering should be properly rounded;

(3) any butts between lengths of doubling straps, so that there is adequate separation of the butt weld from the primary structure below during welding, and so that a high quality root run under controlled circumstances is completed prior to completing the remainder of the weld. Ultrasonic testing should be carried out on completion to verify full penetration.

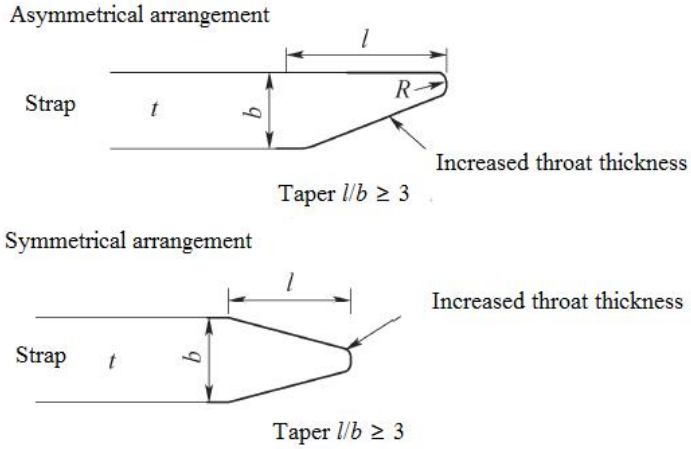

Figure 2.6.6 Application of Doubling Straps

Table 2.6.6

Item	Standard	Limit	Remark
Tapering	$l/b>3$		Special consideration to be drawn to design of strap terminations in fatigue sensitive areas
Radius	$0.1 \times b$	Min 30 mm	
Material			See paragraph 2.4 General requirement to materials
Weld Size			Depending on number and function of straps. Throat thickness to be increased 15 % toward ends
Welding	Welding sequence from middle towards the free ends		See sketch. For welding of lengths > 1000 mm step welding to be applied

2.6.7 Welding of pitting corrosion

Note:

Shallow pits may be filled by applying coating or pit filler. Pits can be defined as shallow when their depth is less than 1/3 of the original plate thickness.

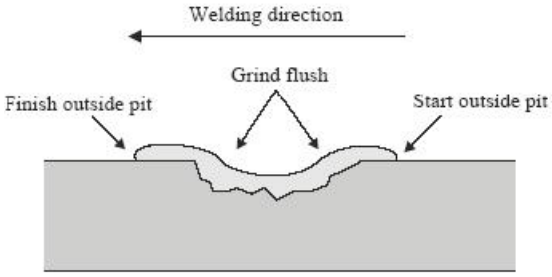

Figure 2.6.7 Welding of pits

Table 2.6.7

Item	Standard	Limit	Remark
Extent / Depth	Pits / grooves are to be welded flush with the original surface.	If deep pits or grooves are clustered together or remaining thickness is less than 6 mm, the plates should be renewed.	See also IACS UR W11 (Reference 2.4 to this Section)
Cleaning	Heavy rust to be removed		
Pre-Heating	See Table 2.5.1	Required when ambient temperature < 5℃	Always use propane torch or similar to remove any moisture
Welding Sequence	Reverse direction for each layer		See also IACS UR W11 (Reference 2.4 to this Section)
Weld Finish	IACS UR W33 (Reference 2.8 to this Section)		
NDT	IACS UR W33 (Reference 2.8 to this Section)	Min 10% extent	Preferably MPI

Reference is made to TSCF Guidelines, Ref. 2.2 & 2.3.

2.6.8 Welding repairs for cracks

In the event that a crack is considered weldable, either as a temporary or permanent repair, the following techniques should be adopted as far as practicable. Run-on and run-off plates should be adopted at all free edges.

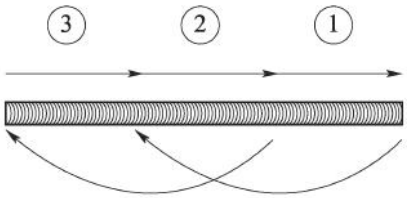

Figure 2.6.8.a Step back technique

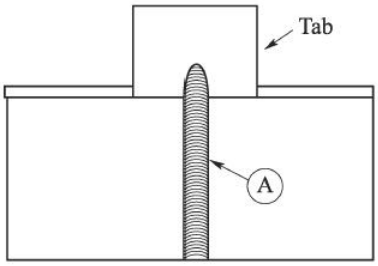

Figure 2.6.8.b End crack termination

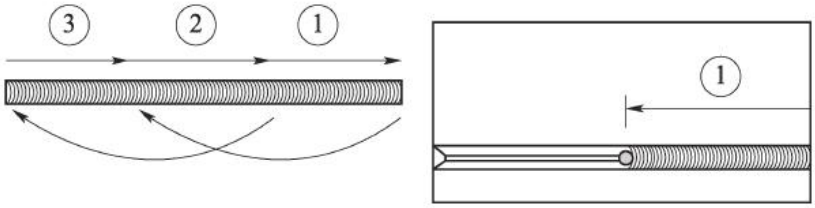

Figure 2.6.8.c Welding sequence for cracks with length less than 300 mm

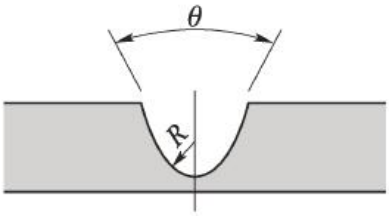

Figure 2.6.8.d Groove preparation (U-groove left and V-groove right)

Table 2.6.8

Item	Standard	Limit	Remark
Groove Preparation	$\theta = 45^{o} \sim 60^{o}$ $r = 5$ mm		For through plate cracks as for newbuilding. See also Figure 2.6.8.d
Termination	Termination to have slope 1:3		For cracks ending on edges weld to be terminated on a tab. See Figure 2.6.8.b
Extent	On plate max 400 mm length. Vee out 50 mm past end of crack	On plate max 500 mm. Linear crack, not branched	
Welding Sequence	See Figure 2.6.8.c for sequence and direction	For cracks longer than 300 mm step-back technique should be used Figure 2.6.8.a	Always use low hydrogen welding consumables
Weld Finish	IACS UR W33 (Reference 2.8 to this Section)		
NDT	IACS UR W33 (Reference 2.8 to this Section)	100 % MP or PE of groove	100% surface crack detection + UE or RE for butt joints

Appendix 3 SURVEYS OF WATERTIGHT CABLE TRANSITS

1 Application

1.1 These requirements apply to all vessels contracted for construction on or after 1st July 2021 and are in addition to the requirements of appendix 1 of this Chapter.

1.2 Watertight cable transits are to be installed and maintained in accordance with the manufacturer's requirements and in accordance with the requirements of the relevant Type Approval certification.

2 Cable Transit Seal Systems Register

2.1 A Cable Transit Seal Systems Register (Register) is to be provided by the shipbuilder for all watertight cable transits fitted to the vessel. For an example of a register see Annex 3 to Appendix 1 of this Chapter– "Recommendatory Sample - Cable Transit Seal Systems Register". The Register can be in either a hard copy or digitized media. It is to include:

(1) A marking/identification system,

(2) Documentation referencing manufacturer manual(s) for each type of cable transit installed,

(3) The Type Approval certification for each type of transit system,

(4) Applicable installation drawings,

(5) A recording of each installed transit documenting the as built condition after final inspection in the shipyard.

(6) Sections to record any inspection, modification, repair and maintenance.

2.2 The Register shall be reviewed by the attending Surveyor to confirm it contains a list of the watertight cable transits, applicable cable transit information and sections to maintain in-service maintenance and survey records.

2.3 For manned vessels the Register is to be held onboard of the vessel. For unmanned vessels, if a suitable storage location does not exist onboard, the Register may be held ashore. The Register is to be readily available for the attending surveyor.

3 Installation and Maintenance of Watertight Cable Transits

3.1 It is to be confirmed that cable transits have been installed, and where disrupted have been reinstated, in accordance with the manufacturer's requirements and in accordance with the requirements of Type Approval.

3.2 It is to be confirmed where specified, appropriate specialized tools have been used.

CHAPTER 5 SURVEYS AFTER CONSTRUCTION

Section 1 GENERAL PROVISIONS

5.1.1 General requirements

5.1.1.1 For the purpose of maintaining the validity of certificates, ships which have been classed with CCS are to be subject to the surveys as specified in Section 2 of this Chapter (where applicable). CCS may permit, as appropriate, remote inspection technique① to be used to facilitate the required external and internal examinations, including close-up surveys and gauging. Such surveys may be extended by CCS Surveyors at their professional judgement, and the owner is to provide appropriate survey conditions and make arrangements accordingly and has the obligation to pay the expenses related to extending the surveys.

5.1.1.2 If any damage or defect affecting the validity of certificates is found at any of the surveys, the Surveyor is to inform the owner or his representative of the recommendations in time when he deems necessary. When such recommendations are not dealt with, the Surveyor is to report this to the Headquarters of CCS immediately.

5.1.1.3 It is the responsibility of the owner to apply to CCS for all surveys necessary for the maintenance of the validity of certificates and to make preparations and take safety precautions for surveys in accordance with the requirements of the Rules.

5.1.1.4 Unless provided otherwise in this Chapter, surveys after construction of ships engaged on non-international voyages and in restricted service are to comply with the relevant provisions of PART TEN of the Rules.

5.1.2 Reclassification

5.1.2.1 When reclassification is desired for a ship for which the class previously assigned by CCS has been canceled, CCS will carry out a survey appropriate to the age of the ship and the circumstances of the case. If, at such a survey, the ship is found or placed in a good and efficient condition in accordance with CCS rules, CCS will reinstate the original class or assign such other class as may be deemed necessary. The date of any reclassification will be recorded in the Register of Ships or its supplement.

5.1.3 Damage and repair surveys

5.1.3.1 Any damage to hull, equipment or machinery (including electrical installations), which could invalidate the conditions for which a class has been assigned, is to be reported to CCS without delay. CCS will appoint the Surveyor(s) boarding a ship in time to carry out damage surveys at a suitable port where the ship arrives on its voyage. And the scope of the survey is to be that considered by the Surveyor(s) necessary for ascertaining the extent and cause of the damage.

5.1.3.2 All repairs to hull, equipment or machinery (including electrical installations) involving the ship's class are to be made under the supervision of the Surveyor(s). If repairs are effected at a place where services of a CCS Surveyor are not available, CCS is to be informed in time by the owner/company.

5.1.4 Alteration or modification surveys

5.1.4.1 Plans and particulars of any proposed alternations or modifications to the approved scantlings or arrangements of hull, equipment or machinery (including electrical installations) are to be submitted to CCS for approval. Such alterations or modifications and related items are in general to comply with the provisions of the present rules of CCS or at least the requirements of previously applicable rules.

5.1.4.2 Alterations or modifications of a major character, if any, are to comply with the provisions of Section 15 of this Chapter.

5.1.5 Definitions

5.1.5.1 For the purpose of this Chapter, the following definitions apply to all ships:

(1) A **ballast tank** is a tank which is used primarily for the carriage of salt water ballast.

(2) **Space**s are independent compartments, including holds, tanks, cofferdams and void spaces bounding cargo holds, decks and the outer hull.

(3) A **transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, side, bottom, inner bottom, and longitudinal bulkhead (where applicable, hopper side plating and bottom plating of top wing tanks). For transversely framed vessels, a transverse section includes adjacent

---

① Refer to IACS Rec. 42 "Guidelines for Use of Remote Inspection Techniques for surveys".

frames and their end connections in way of transverse sections.
(4) **Representative spaces** are those which are expected to reflect the conditions of other spaces of similar type and service and with similar corrosion protection systems. When selecting representative spaces, account is to be taken of the service and repair history on board and identifiable critical and/or suspect areas.
(5) **Suspect areas** are locations showing substantial corrosion and/or are considered by the Surveyor to be prone to rapid wastage.
(6) **Substantial corrosion** is an extent of corrosion such that assessment of corrosion pattern indicates a wastage in excess of 75% of allowable margins, but within acceptable limits. For CSR ships, substantial corrosion is an extent of corrosion such that the assessment of the corrosion pattern indicates a gauged (or measured) thickness between t_{ren} + 0.5 mm and t_{ren}.
(7) A **corrosion prevention system** is normally considered a full hard protective coating. For the purpose of this Chapter, a full hard protective coating is usually to be epoxy coating or equivalent. Other coating systems, which are neither soft nor semi-hard coatings①, may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specifications.
(8) A **prompt and thorough repair** is a permanent repair completed at the time of survey to the satisfaction of the Surveyor, therein removing the need for the imposition of any associated condition of classification.
(9) **Air pipe heads installed on the exposed decks** are those extending above the freeboard deck or superstructure decks.
(10) **Wind and water strakes** are the strakes of a ship's side shell plating between the ballast and deepest load waterlines. Due to the ship's trim, the strakes may vary over the length of the ship.
(11) An **overall survey** is a survey intended to report on the overall condition of the hull structure and determine the extent of additional close-up surveys.
(12) A **close-up survey** is a survey where the details of structural components are within the close visual inspection range of the surveyor, i.e. normally within reach of hand.
(13) **Special consideration** or **specially considered** (in connection with close-up surveys and thickness measurements) means sufficient close-up inspection and thickness measurements are to be taken to confirm the actual average condition of the structure under the coating.
(14) **Cargo length area** is that part of the ship which includes all cargo holds and adjacent areas including fuel tanks, cofferdams, ballast tanks and void spaces.
(15) **Coating condition**② is defined as follows:

GOOD: Condition with only minor spot rusting;
FAIR: Condition with local breakdown at edges of stiffeners and weld connections and/or light rusting over 20% or more of areas under consideration, but less than as defined for POOR condition;
POOR: Condition with general breakdown of coating over 20% or more of areas or hard scale at 10% or more of areas under consideration.

(16) **Extensive corrosion** is an extent of corrosion consisting of hard and/or loose scale, including pitting, over 70% or more of the area under consideration, accompanied by evidence of thickness diminution.
(17) **Renewal thickness (t_{ren})** is the minimum allowable thickness, in mm, below which renewal of structural members is to be carried out.
(18) **Pitting corrosion** is defined as scattered corrosion spots/areas with local material reductions which are greater than the general corrosion in the surrounding area. Pitting intensity is defined in Figure 5.1.5.1(18).
(19) **Edge corrosion** is defined as local corrosion at the free edges of plates, stiffeners, primary support members and around openings. An example of edge corrosion is shown in Figure 5.1.5.1(19).
(20) **Grooving corrosion** is typically local material loss adjacent to weld joints along abutting stiffeners and at stiffener or plate butts or seams. An example of groove corrosion is shown in Figure 5.1.5.1(20).
(21) **Remote Inspection Technique (RIT)** is a means of survey that enables examination of any part of the structure without the need for direct physical access of the surveyor (refer to IACS Rec.42).

---

① As for the requirements regarding semi-hard coatings, these coatings, if already applied, will not be accepted from the next special or intermediate survey commenced on or after 1 July 2010, whichever comes first, with respect to waiving the annual internal examination of the ballast tanks.
② For oil tankers and chemical tankers, reference is made to IACS Recommendation No.87 - Guidelines for Coating Maintenance & Repairs for Ballast Tanks and Combined Cargo/Ballast Tanks on Oil Tankers.

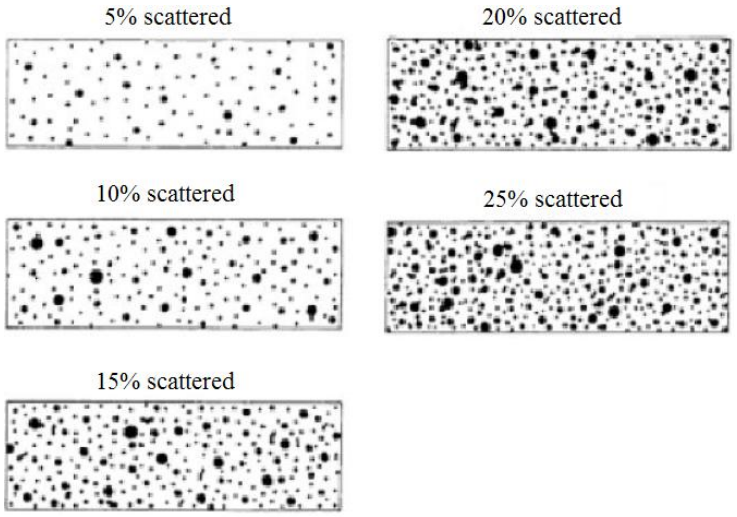

Figure 5.1.5.1(18) Pitting Intensity Diagrams

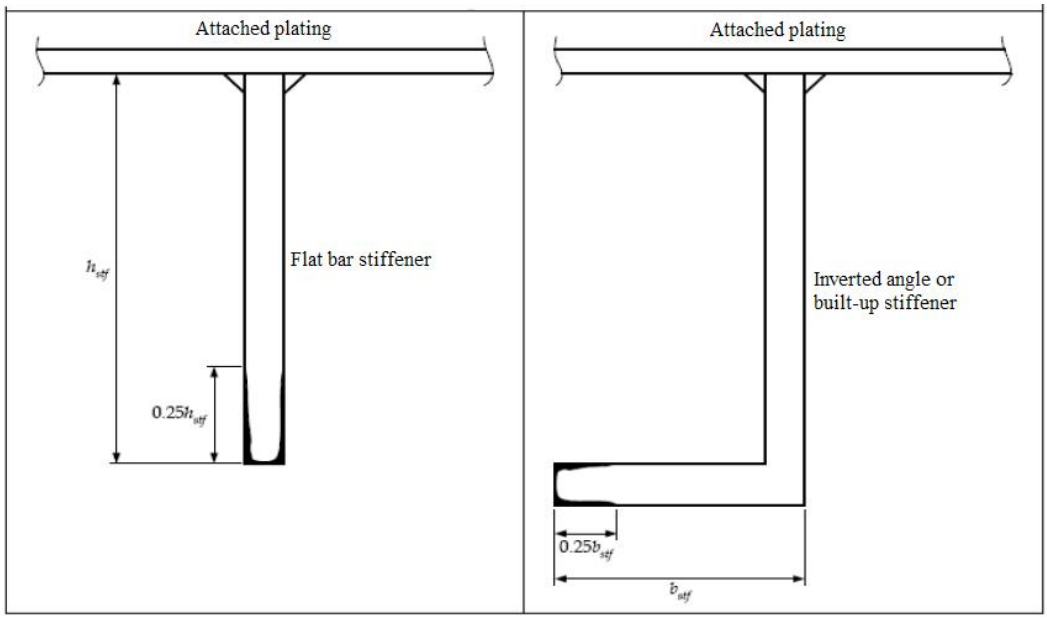

Figure 5.1.5.1(19) Edge Corrosion

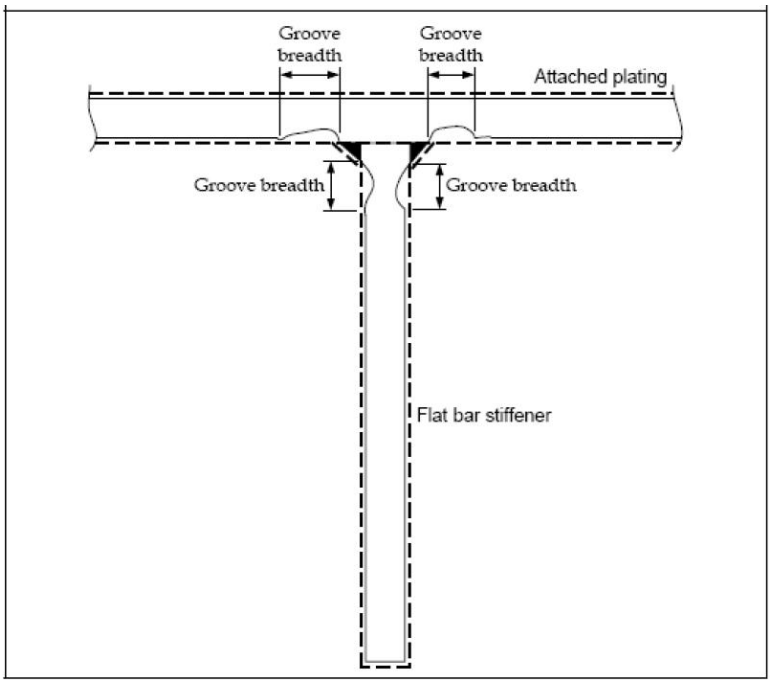

Figure 5.1.5.1(20) Grooving Corrosion

5.1.5.2 The following definitions are added for oil tankers in addition to those in 5.1.5.1 of this Chapter:
(1) A **ballast tank** is a tank which is used primarily for the carriage of salt water ballast.
A **combined cargo/ballast tank** is a tank which is used for the carriage of cargo or ballast water as a routine part of the ship's operation and will be treated as a ballast tank. Cargo tanks in which water ballast might be carried only in exceptional cases per MARPOL I/18.3 are to be treated as cargo tanks.
(2) **Cargo area** is that part of the ship that contains cargo tanks, slop tanks and cargo/ballast pump-rooms, cofferdams, ballast tanks and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above mentioned spaces.
(3) An **oil tanker** is a ship which is constructed primarily to carry oil in bulk in cargo tanks forming an integral part of the ship's hull, including ship types such as combination carriers (Ore/Oil ships etc.) but excluding ships carrying oil in independent tanks not part of the ship's hull such as asphalt carriers.
(4) A **double hull oil tanker** is a ship which is constructed primarily for the carriage of oil in bulk, which has the cargo tanks forming an integral part of the ship's hull and is protected by a double hull which extends for the entire length of the cargo area, consisting of double sides and double bottom spaces for the carriage of water ballast or void spaces.
5.1.5.3 The following definitions are added for bulk carriers in addition to those in 5.1.5.1 of this Chapter:
(1) An **existing bulk carrier** is generally a bulk carrier which has been constructed in compliance with plans approved in accordance with the rules effective before entry into force of the Rules.
(2) A **double skin bulk carrier** is a ship which is constructed generally with single deck, double bottom, topside tanks and hopper side tanks in cargo spaces, and is intended primarily to carry dry cargo in bulk, including such types as ore carriers and combination carriers,[①] in which all cargo holds are bounded by a double-side skin (regardless of the width of the wing space). Common Structural Rules[②] does not apply to ore and combination carriers.
(3) **Ballast tank:**
① A **ballast tank of a bulk carrier** is a tank which is used primarily for salt water ballast, or, where applicable, a space which is used for both cargo and salt ballast will be treated as a ballast tank when substantial corrosion has been found in that space.
② A **ballast tank of a double skin bulk carrier** is a tank which is used primarily for salt water ballast, or, where applicable, a space which is used for both cargo and salt ballast will be treated as a ballast

① For combination carriers and combination carriers with longitudinal bulkheads, additional requirements are specified in Section 6 of this Chapter.
② PART TEN of the Rules (2012 version) and its 2013 and 2014 amendments or PART NINE of the Rules (2015 version) and its subsequent versions (including amendments).

tank when substantial corrosion has been found in that space. A double side tank is to be considered as a separate tank even if it is in connection to either the topside tank or the hopper side tank.

5.1.6 Preparations for survey

5.1.6.1 Conditions for survey

(1) The owner is to provide the necessary facilities for a safe execution of the survey. For self-propelled ships having the notation ESP, the following are to be complied with:

① in order to enable the attending Surveyors to carry out the survey, provisions for proper and safe access are to be agreed between the owner and CCS in accordance with the relevant requirements of IACS PR37;

② details of the means of access are to be provided in the Survey Planning Questionnaire given in Appendix 11B of this Chapter;

③ in cases where the provisions of safety and required access are judged by the attending Surveyors not to be adequate, the survey of the spaces involved is not to proceed.

(2) Tanks and spaces are to be safe for access. Tanks and spaces are to be gas free and properly ventilated. Prior to entering a tank, void or enclosed space, it is to be verified that the atmosphere in that space is free from hazardous gas and contains sufficient oxygen.

(3) In preparation for survey and thickness measurements and to allow for a thorough examination, all spaces are to be cleaned including removal from surfaces of all loose accumulated corrosion scale. Spaces are to be sufficiently clean and free from water, scale, dirt, oil residues etc. to reveal corrosion, deformation, fractures, damages, or other structural deterioration, as well as the condition of the coating. However, those areas of structure whose renewal has already been decided by the owner need only be cleaned and descaled to the extent necessary to determine the limits of the renewed areas.

(4) Sufficient illumination is to be provided to reveal corrosion, deformation, fractures, damages or other structural deterioration, as well as the condition of the coating.

(5) Where soft or semi-hard coatings have been applied, safe access is to be provided for the Surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft or semi-hard coating is to be removed.

(6) Casings, ceilings or linings, and loose insulation, where fitted, are to be removed, as required by the Surveyor, for examination of plating and framing. Compositions on plating are to be examined and sounded, but need not be disturbed if found adhering satisfactorily to the plating.

(7) In refrigerated cargo spaces the condition of the coating behind the insulation is to be examined at representative locations. The examination may be limited to verification that the protective coating remains effective and that there are no visible structural defects. Where POOR coating condition is found, the examination is to be extended as deemed necessary by the Surveyor. If indents, scratches, etc., are detected during surveys of shell plating from the outside, insulations in way are to be removed as required by the Surveyor, for further examination of the plating and adjacent frames.

5.1.6.2 Access to structures

(1) For survey including overall survey of all ships, means are to be provided to enable the Surveyor to examine the hull structure in a safe and practical way.

(2) For survey of all ships in cargo holds and ballast tanks, and for close-up survey of general cargo ships, oil tankers, chemical tankers, and the hull structure, other than cargo hold shell frames, of bulk carriers, one or more of the following means for access, acceptable to the Surveyor, is to be provided:

① permanent staging and passages through structures;

② temporary staging and passages through structures;

③ hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms;

④ boats or rafts;

⑤ portable ladders;

⑥ other equivalent means.

(3) For close-up surveys of the cargo hold shell frames of bulk carriers less than 100,000 DWT, one or more of the following means for access, acceptable to the Surveyor, is to be provided:

① means referred to in (2)① to ③ and ⑥ above;

② portable ladder restricted to not more than 5 m in length may be accepted for surveys of lower section of a shell frame including bracket;

③ hydraulic arm vehicles such as conventional cherry pickers;

④ boats or rafts, provided the structural capacity of the hold is sufficient to withstand static loads at all

levels of water.

(4) Close-up surveys of the cargo hold shell frames of bulk carriers of 100,000 DWT and above:

① For annual surveys, intermediate survey under 10 years of age and special survey No.1, one or more of the means for access referred to in (3) above (except the portable ladder), acceptable to the surveyor, may be provided.

② For subsequent intermediate surveys and special surveys, one or more of the following means for access, acceptable to the Surveyor, is to be provided:

a. either permanent or temporary staging and passage through structures for close-up survey of the upper part of hold frames;

b. hydraulic arm vehicles such as conventional cherry pickers for surveys of lower and middle parts of shell frames as alternative to staging;

c. means referred to in (2)③, ④ and ⑥ above. Boats or rafts, provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water.

③ Notwithstanding the requirement in (4)① for exclusion of portable ladder, the use of a portable ladder fitted with a mechanical device to secure the upper end of the ladder is acceptable for the following:

a. "close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating of the forward cargo hold" at annual survey, as required in 5.7.2.4(1)①b;

b. "close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating of one other selected cargo hold (other than forward cargo hold)" at annual survey, as required in 5.7.2.4(2)①b;

④ The use of hydraulic arm vehicles or aerial lifts ("Cherry picker") may be accepted by the attending surveyor for the close-up survey of the upper part of side shell frames or other structures in all cases where the maximum working height is not more than 17 m.

(5) For Surveys conducted by use of a remote inspection technique, one or more of the following means for access, acceptable to the Surveyor, is to be provided:

① unmanned robot arm;

② Remotely Operated Vehicles (ROV);

③ Unmanned Aerial Vehicles / Drones;

④ other means acceptable to CCS.

5.1.6.3 Equipment for survey

(1) Thickness measurement is normally to be carried out by means of ultrasonic test equipment. The accuracy of the equipment is to be proven to the Surveyor as required. Thickness measurements are to be carried out by a firm approved by CCS in accordance with Appendix 10 of this Chapter, except that in respect of measurements of non-ESP ships less than 500 gross tonnage and all fishing vessels, the firm need not be so approved.

(2) One or more of the following fracture detection procedures may be required if deemed necessary by the Surveyor:

① radiographic equipment;

② ultrasonic equipment;

③ magnetic particle equipment;

④ dye penetrant.

(3) For self-propelled ships having the notation ESP, the following are to be complied with:

① explosimeter, oxygen-meter, breathing apparatus, lifelines, riding belts with rope and hook and whistles together with instructions and guidance on their use are to be made available during the survey. A safety checklist is to be provided;

② adequate and safe lighting is to be provided for the safe and efficient conduct of the survey;

③ adequate protective clothing is to be made available and used (e.g. safety helmet, gloves, safety shoes, etc.) during the survey.

5.1.6.4 Survey at sea or at anchorage[①]

(1) Survey at sea or at anchorage may be accepted provided the Surveyor is given the necessary assistance from the personnel onboard. Necessary precautions and procedures for carrying out the survey are to be in

① Reference is made to IACS Recommendation No.39 − Safe Use Of Rafts Or Boats For Survey.

accordance with 5.1.6.1, 5.1.6.2 and 5.1.6.3 above.
(2) A communication system is to be arranged between the survey party in the tank and the responsible officer on deck. This system must also include the personnel in charge of ballast pump handling if boats or rafts are used.
(3) When boats or rafts are used, appropriate life jackets are to be available for all participants. A safety checklist is to be provided.
(4) Surveys of tanks or applicable holds by means of boats or rafts may only be undertaken with the agreement of the Surveyor, who is to take into account the safety arrangements provided, including weather forecasting and ship response under foreseeable conditions and provided the expected rise of water within the tank does not exceed 0.25 m.
(5) Self-propelled ships having the notation ESP (hereinafter referred to as ESP ships) are to comply with, in addition to 5.1.6.4(1) to (4), the following requirements:

① Rafts or boats alone may be allowed for inspection of the under deck areas for tanks or spaces, if the depth of the webs is 1.5 m or less.

② If the depth of the webs is more than 1.5 m, rafts or boats alone may be allowed only:

a. when the coating of the under deck structure is in GOOD condition and there is no evidence of wastage; or

b. if a permanent means of access is provided in each bay① to allow safe entry and exit. This means:

(a) access direct from the deck via a vertical ladder and a small platform fitted approximately 2 m below the deck in each bay; or

(b) access to deck from a longitudinal permanent platform having ladders to deck in each end of the tank. The platform is, for the full length of the tank, be arranged in level with, or above, the maximum water level needed for rafting of under deck structure. For this purpose, the ullage corresponding to the maximum water level is to be assumed not more than 3 m from the deck plate measured at the midspan of deck transverses and in the middle length of the tank, e.g. in respect to oil tankers (including double hull oil tankers) and chemical tankers, see Figure 5.1.6.4(5)②.

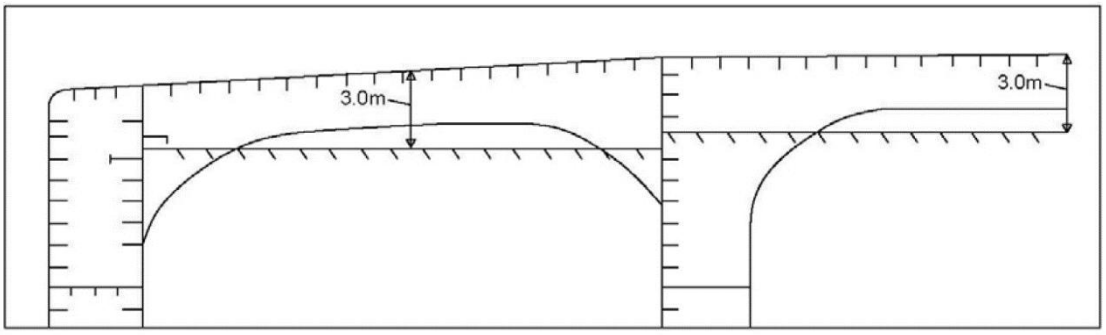

Figure 5.1.6.4(5)② Maximum Water Level in a Tank

If neither of the above conditions are met, then staging or an "other equivalent means" is to be provided for the survey of the under deck areas.

③ The use of rafts or boats alone in ① and ② above does not preclude the use of boats or rafts tomove about within a tank during a survey.

④ When rafts or boats will be used for close-up survey, the following conditions are to be observed:

a. the boat or raft is to be tethered to the access ladder and an additional person is to be stationed down the access ladder with a clear view of the boat or raft;

b. the surface of water in the tank or hold is to be calm (under all foreseeable conditions the expected rise of water within the tank or hold is not to exceed 0.25 m) and the water level stationary. On no account is the level of the water to be rising while the boat or raft is in use;

c. the tank, hold or space must contain clean ballast water only. Even a thin sheen of oil on the water is not acceptable;

d. at no time is the water level to be allowed to be within 1 m of the deepest underdeck web face

① Bay is the area between adjacent transverse frames or transverse bulkheads.

flat so that the survey team is not isolated from a direct escape route to the tank hatch. Filling to levels above the deck transverses is only to be contemplated if a deck access manhole is fitted and open in the bay being examined, so that an escape route for the survey party is available at all times. Other effective means of escape to the deck may be considered;

e. if the tanks (or spaces) are connected by a common venting system, or inert gas system, the tank in which the boat or raft is to be used is to be isolated to prevent a transfer of gas from other tanks (or spaces) (for close-up survey of oil tankers and chemical tankers);

f. only rough duty, inflatable rafts or boats, having satisfactory residual buoyancy and stability even if one chamber is ruptured, are to be used.

5.1.6.5 Survey programme

(1) A specific survey programme is to be worked out by the owner in cooperation with CCS in advance of the special survey for ESP ships or the intermediate survey for ESP ships of 10 years of age or over. The survey programme at intermediate survey may consist of the survey programme at the previous special survey supplemented by the executive hull summary of that special survey and later relevant survey reports. The survey Programme is to be worked out taking into account any amendments to the survey requirements implemented after the last special survey carried out. The survey programme is to be in a written format based on the information in Appendix 11A of this Chapter. The survey is not to commence until the survey programme has been agreed. Prior to the development of the survey programme, the survey planning questionnaire is to be completed by the owner based on the information set out in Appendix 11B of this Chapter, and forwarded to CCS.

(2) In developing the survey programme, the following documentation is to be collected and consulted with a view to reasonably selecting tanks, areas, and structural elements to be examined:

① For bulk carriers:

a. survey status and basic ship information;

b. documentation on board, as described in 5.1.7.2 and 5.1.7.3;

c. main structural plans (scantling drawings), including information regarding use of high-tensile steels (HTS);

d. relevant previous survey and inspection reports from both CCS and the owner;

e. information regarding the use of the ship's holds and tanks, typical cargoes and other relevant data;

f. information regarding corrosion protection level of the newbuilding;

g. information regarding the relevant maintenance level during operation;

② For oil tankers and chemical tankers:

a. survey status and basic ship information;

b. documentation on board, as described in 5.1.7.2 and 5.1.7.3;

c. main structural plans (scantling drawings) of cargo and ballast tanks, including information regarding use of high tensile steels (HTS) (for chemical tankers, also including information regarding use of clad steel and stainless steel);

d. Executive Hull Summary;

e. relevant previous damage and repair history;

f. relevant previous survey and inspection reports from both CCS and the owner;

g. details of the inert gas plant and tank cleaning procedures;

h. information and other relevant data regarding conversion or modification of the ship's cargo and ballast tanks since the time of construction;

i. description and history of the coating and corrosion protection system, if any;

j. inspections by the owner's personnel during the last 3 years with reference to structural deterioration in general, leakages in tank boundaries and piping and condition of the coating and corrosion protection system, if any. Guidance for reporting is shown in Appendix 12 of this Chapter;

k. information regarding the relevant maintenance level during operation including port State control reports of inspection containing hull related deficiencies, Safety Management System non-conformities relating to hull maintenance, including the associated corrective action(s);

l. any other information that will help identify suspect areas and critical structural areas;

m. cargo and ballast history for the last 3 years, including carriage of cargo under heated conditions (only for oil tankers);

n. information regarding the use of the ship's tanks, typical cargoes and other relevant data (only for chemical tankers).

(3) The submitted survey programme is to account for and comply, as a minimum, with the requirements for close-up survey, thickness measurement and tank testing (also including pipe testing for chemical

tankers), respectively, and is to include relevant information including at least:

① basic ship information and particulars;

② main structural plans (scantling drawings), including information regarding use of high tensile steels (HTS) (for chemical tankers, also including information regarding use of clad steel and stainless steel);

③ plan of tanks;

④ list of tanks with information on use, protection and condition of coating;

⑤ conditions for survey (e.g. information regarding tank cleaning, gas freeing, ventilation, lighting, etc.);

⑥ provisions and methods for access to structures;

⑦ equipment for surveys;

⑧ nomination of tanks and areas for close-up survey;

⑨ nominations of areas and sections for thickness measurement;

⑩ nomination of tanks for tank testing (for chemical tankers, and the pipes that are to undergo pipe testing);

⑪ identification of the thickness measurement company (for oil tankers and chemical tankers);

⑫ damage experience related to the ship in question;

⑬ critical structural areas and suspect areas, where relevant (for oil tankers and chemical tankers).

(4) The maximum acceptable structural corrosion diminution levels applicable to the ship are given in Appendix 1 of this Chapter.

(5) In preparing the survey programme, reference may be made to Appendix 12 of this Chapter, Guidelines for Technical Assessment in Conjunction with Planning for Enhanced Surveys and owner's Report.

5.1.6.6 Survey planning meeting for ESP ships

(1) The establishment of proper preparation and the close cooperation between the attending Surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.

(2) Prior to commencement of any part of the special and intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance, the thickness measurement company operator (as applicable) and the master of the ship or an appropriately qualified representative appointed by the Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

(3) The following is an indicative list of items that are to be addressed in the meeting:

① schedule of the ship (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations, etc.);

② provisions and arrangements for thickness measurements (i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety);

③ extent of the thickness measurements;

④ acceptance criteria (refer to the list of minimum thicknesses contained in Appendix 11A "Survey Programme" of this Chapter);

⑤ extent of close-up survey and thickness measurement considering the coating condition and suspect areas/areas of substantial corrosion;

⑥ execution of thickness measurements;

⑦ taking representative readings in general and where uneven corrosion/pitting is found;

⑧ mapping of areas of substantial corrosion; and

⑨ communication between attending Surveyor(s), the thickness measurement company operator(s) and owner's representative(s) concerning findings.

5.1.6.7 Rescue and emergency response equipment

(1) If breathing apparatus and/or other equipment is used as "rescue and emergency response equipment", then it is recommended that the equipment should be suitable for the configuration of the space being surveyed.

5.1.7 Documentation on board

5.1.7.1 General requirements

(1) For ESP ships, the owner is to supply and maintain on board documentation as specified in 5.1.7.2 and 5.1.7.3, which is to be readily available for the Surveyor.

(2) The documentation is to be kept on board for the lifetime of the ship.
(3) For tankers and bulk carriers subject to SOLAS Reg. II-1/3-10, the Owner is to arrange the updating of the Ship Construction File (SCF) throughout the ship's life whenever a modification of the documentation included in the SCF has taken place. Documented procedures for updating the SCF are to be included within the Safety Management System.

5.1.7.2 Survey report file[①]

(1) A survey report file is to be a part of the documentation on board consisting of:

① reports of structural surveys;

② executive hull summary;

③ thickness measurement reports.

5.1.7.3 Supporting documents

(1) The following additional documentation is to be available on board:

① survey programme as required by 5.1.6.5 until such time as the special survey or intermediate survey, as applicable, has been completed;

② main structural plans of cargo/cargo oil and ballast tanks (for CSR ships these plans are to include for each structural element both the as-built and renewal thickness. Any thickness for voluntary addition is also to be clearly indicated on the plans. The midship section plan to be supplied on board the ship is to include the minimum allowable hull girder sectional properties for the hold/ tank transverse section in all cargo holds/tanks);

③ previous repair history;

④ cargo and ballast history;

⑤ inspection by ship's personnel with reference to:

a. structural deterioration in general;

b. leakages in bulkheads and piping;

c. condition of coating or corrosion protection, if any;

d. a guidance for reporting is shown in paragraph 2, Appendix 12 of this Chapter;

⑥ extent of use of inert gas plant and tank cleaning procedures (for oil tankers and chemical tankers);

⑦ any other information that will help identify suspect areas and/or critical structural areas requiring inspection;

⑧ Cable Transit Seal Systems Register, the owner is to maintain the Register to record any disruption (repair, modification or opening out and closing) to a cable transit or to record the installation of a new cable transit.

(2) For tankers and bulk carriers subject to SOLAS Reg. II-1/3-10, the Ship Construction File (SCF), limited to the items to be retained onboard, is to be available on board.

5.1.7.4 Review of documentation on board

(1) Prior to survey, the Surveyor is to examine the completeness of the documentation on board, and its contents as a basis for the survey.

(2) For tankers and bulk carriers subject to SOLAS Reg. II-1/3-10, on completion of the survey, the surveyor is to verify that the update of the Ship Construction File (SCF) has been done whenever a modification of the documentation included in the SCF has taken place.

① For the SCF stored on board ship, the surveyor is to examine the information on board ship. In cases where any major event, including, but not limited to, substantial repair and conversion, or any modification to the ship structures, the surveyor is to also verify that the updated information is kept on board the ship. If the updating of the SCF onboard is not completed at the time of survey, the Surveyor records it and requires confirmation at the next periodical survey.

② For the SCF stored on shore archive, the surveyor is to examine the list of information included on shore archive. In cases where any major event, including, but not limited to, substantial repair and conversion, or any modification to the ship structures, the surveyor is to also verify that the updated information is stored on shore archive by examining the list of information included on shore archive or kept on board the ship. In addition, the surveyor is to confirm that the service contract with of the Archive Center is valid. If the updating of the SCF Supplement ashore is not completed at the time of survey, the Surveyor records it and requires confirmation at the next periodical survey.

(3) For tankers and bulk carriers subject to SOLAS Reg. II-1/3-10, on completion of the survey, the

① Survey report files are available from the Headquarters of CCS and the owner.

surveyor is to verify any addition and/or renewal of materials used for the construction of the hull structure are documented within the Ship Construction File list of materials.

5.1.8 Reporting and evaluation of survey

5.1.8.1 The data and information on the structural condition of the ship collected during the survey is to be evaluated for acceptability and continued structural integrity of the ship.

(1) For CSR bulk carriers, the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the special surveys carried out after the ship reached 15 years of age (or during the special survey no. 3, if this is carried out before the ship reaches 15 years of age) in accordance with the criteria for longitudinal strength of the ship's hull girder for CSR bulk carriers specified in Common Structural Rules[①].

(2) The final result of evaluation of the ship's longitudinal strength required in (1), after renewal or reinforcement work of structural members, if carried out as a result of initial evaluation, is to be reported as a part of the Executive Hull Summary.

5.1.8.2 Principles for survey reporting are given in Appendix 11 of this Chapter.

5.1.8.3 When a survey is split between different survey units of CCS, a report is to be completed by the survey unit implementing the commencement or intermediate stage of the enhanced survey. A list of items examined and/or tested (pressure testing, thickness measurements, etc.) and an indication of whether the item has been credited, are to be made available to the next survey unit and/or attending Surveyor(s), prior to continuing or completing the survey.

5.1.8.4 An executive hull summary (see Appendix 11 of this Chapter) is to be summarized and developed by the survey unit completing the enhanced survey, and upon verification and endorsement by CCS authorized person, the executive hull summary is to be issued to the owner and placed on board the ship for reference at future surveys.

5.1.9 Procedures for thickness measurements

5.1.9.1 General requirements

(1) Except for 5.1.9.3, this paragraph applies to all ships.

(2) The required thickness measurements, if not carried out by CCS itself, are to be witnessed by an attending Surveyor of CCS.

(3) The thickness measurement company is to be part of the survey planning meeting prior to the commencement of the survey. The following are to be agreed during the meeting:

① reporting of thickness measurements on regular basis;

② prompt notification to the Surveyor in case of findings such as:

a. excessive and/or extensive corrosion or pitting/grooving of any significance;
b. structural defects like buckling, fractures and deformed structures;
c. detached and/or holed structure; and
d. corrosion of welds.

(4) Thickness measurements of structures in areas where close-up surveys are required are to be carried out simultaneously with close-up surveys.

(5) In all cases the extent of the thickness measurements is to be sufficient as to represent the actual average condition.

5.1.9.2 Thickness measurement

(1) The thickness measurements are to be carried out by a qualified company certified by CCS according to Appendix 10 of this Chapter.

5.1.9.3 Number and locations of measurements

(1) Application

This subparagraph only applies to CSR ships. For non-CSR ships, the requirements for number and locations of measurements are to be in accordance the applicable requirements of this Chapter depending on ship's age and structural elements concerned.

(2) Number of measurements

Considering the extent of thickness measurements according to the different structural elements of the ship and surveys (special, intermediate and annual), the locations of the points to be measured are given for the most important items of the structure.

(3) Locations of measurements

Tables 5.1.9.3(3)a to c provide explanations and/or interpretations for the application of those requirements

---

① Chapter 13, PART TEN of the Rules (2012 version) and its 2013 and 2014 amendments or Chapter 13, PART 9-1 of the Rules (2015 version) and its subsequent versions (including amendments).

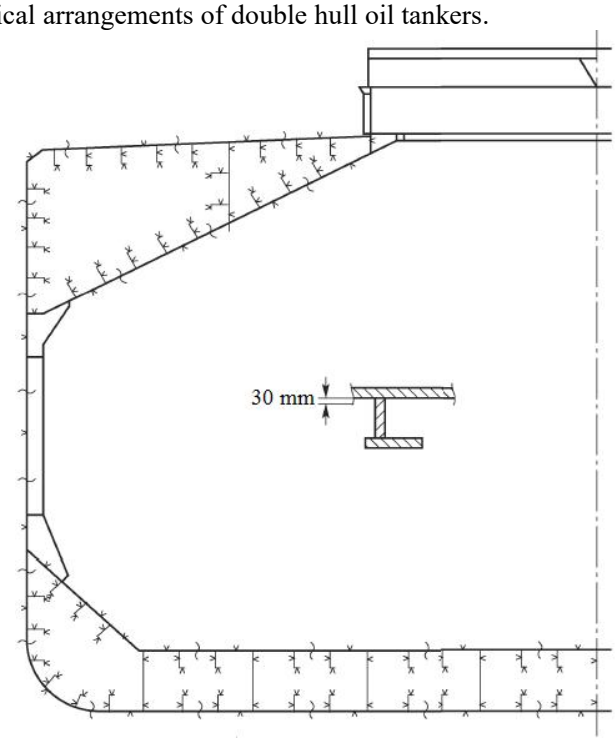
indicated in CSR rules, which refer to both systematic thickness measurements related to the calculation of global hull girder strength and specific measurements connected to close-up surveys.

Interpretations of Rule Requirements for the Locations and Number of Points to Be Measured for CSR Bulk Carriers (Single Skin) Table 5.1.9.3(3)a

Item	Interpretation	Figure reference
Selected plates on deck, tank top, bottom, double bottom and wind-and-water area	"Selected" means at least a single point on one out of three plates, to be chosen on representative areas of average corrosion	
All deck, tank top and bottom plates and wind-and-water strakes	At least two points on each plate to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion	
Transverse section	A transverse section includes all longitudinal members such as plating, longitudinals and girders at the deck, side, bottom; inner bottom and hopper side plating, longitudinal bulkhead and bottom plating in top wing tanks	Figure 5.1.9.3(3)a
All cargo hold hatch covers and coamings	Including plates and stiffeners	Locations of points are given in Figure 5.1.9.3(3)b
Transverse section of deck plating outside line of cargo hatch openings	Two single points on each deck plate (to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion) between the ship sides and hatch coamings in the transverse section concerned	
All deck plating and underdeck structure inside line of hatch openings between cargo hold hatches	"All deck plating" means at least two points on each plate to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion. "Under deck structure": at each short longitudinal girder: three points for web plating (fwd/middle/aft), single point for face plate, one point for web plating and one point for face plating of transverse beam in way. At each end of transverse beams, one point for web plating and one point for face plating	Extent of areas is shown in Sheet 14 of paragraph 13.2B, Appendix 13 of this Chapter; Location of points are given in Figure 5.1.9.3(3)f
Selected side shell frames in cargo holds	Including side shell frames, upper and lower end attachments and adjacent shell plating. 25% of frames: one out of four frames should preferably be chosen throughout the cargo hold length on each side. 50% of frames: one out of two frames should preferably be chosen throughout the cargo hold length on each side. "Selected frames" means at least 3 frames on each side of cargo holds	Extent of areas is shown in Sheet 14 of paragraph 13.2B, Appendix 13 of this Chapter; Locations of points are given in Figure 5.1.9.3(3)c
Transverse bulkheads in cargo holds	Including bulkhead plating, stiffeners and girders, and including internal structure of upper and lower stools, where fitted. Two selected bulkheads: one is to be the bulkhead between the two foremost cargo holds and the second may be chosen in other positions	Areas of measurements are shown in Sheet 14 of paragraph 13.2B, Appendix 13 of this Chapter; Locations of points are given in Figure 5.1.9.3(3)d
One transverse bulkhead in each cargo hold	This means that the close-up survey and related thickness measurements are to be performed on one side of the bulkhead; the side is to be chosen based on the outcome of the overall survey of both sides. In the event of doubt, the Surveyor may also require (possibly partial) close-up survey on the other side	Areas of measurements are shown in Sheet 14 of paragraph 13.2B, Appendix 13 of this Chapter; Locations of points are given in Figure 5.1.9.3(3)d
Transverse bulkheads in one topside, hopper and double bottom ballast tank	Including bulkhead and stiffening systems. The ballast tank is to be chosen based on the history of ballasting among those prone to have the most severe conditions	Locations of points are given in Figure 5.1.9.3(3)e
Transverse webs in ballast tanks	Including web plating, face plates, stiffeners and associated plating and longitudinals. One of the representative tanks of each type (i.e. topside or hopper or side tank) is to be chosen in the forward part	Areas of measurements are shown in Sheet 14 of paragraph 13.2B, Appendix 13 of this Chapter; Locations of points are given in

Item	Interpretation	Figure reference
		Figure 5.1.9.3(3)c

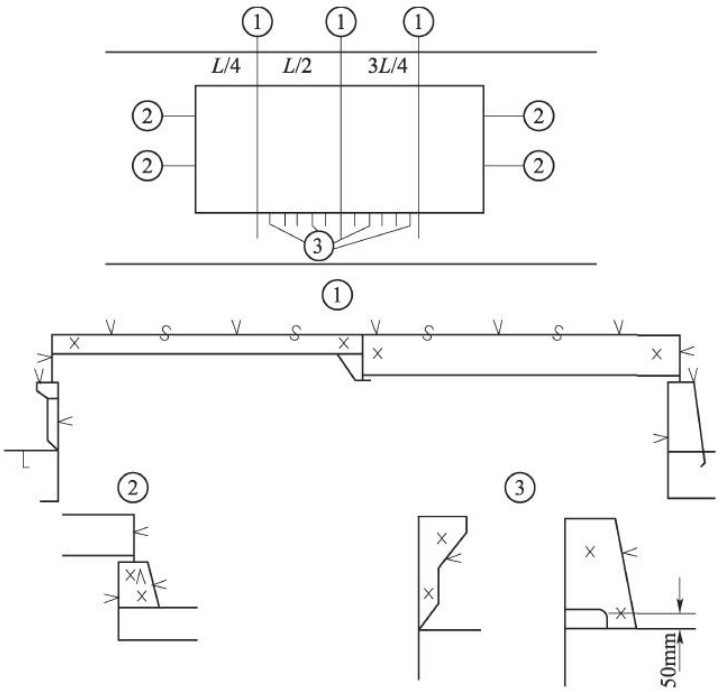
For facilitating the explanations and/or interpretations given in Tables 5.1.9.3(3)a to c, Figures 5.1.9.3(3)a to f are provided to show typical arrangements of single side skin bulk carriers, and Figures 5.1.9.3(3)g to l are provided to show typical arrangements of double side skin bulk carriers and Figures 5.1.9.3(3)m to p are provided to show typical arrangements of double hull oil tankers.



Single side bulk carrier

Note: Measurements are to be taken on both port and starboard sides of the selected transverse section.

Figure 5.1.9.3(3)a Transverse Section of a Single Skin Bulk Carrier

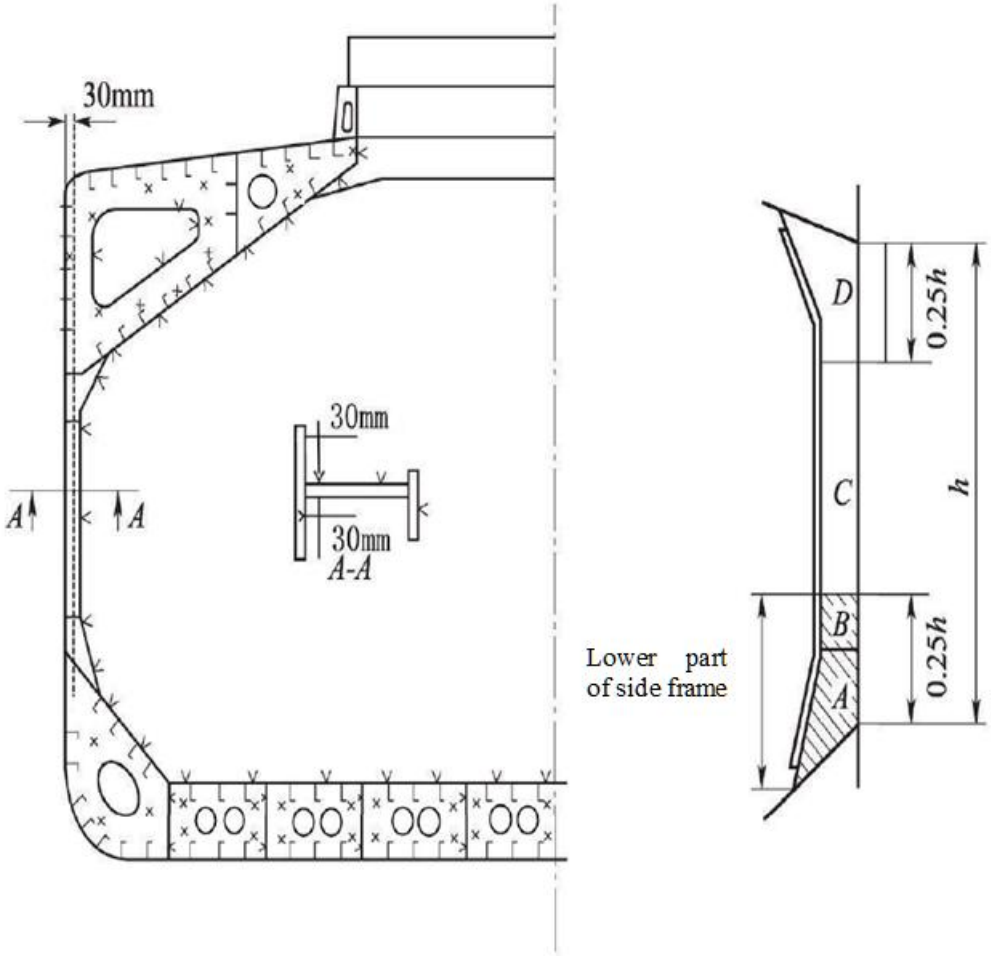


Notes:

1. Three sections at $L/4$, $L/2$, $3L/4$ of hatch cover length, including:
   - one measurement of each hatch cover plate and skirt plate;
   - measurements of adjacent beams and stiffeners;
   - one measurement of coaming plates and coaming flange, each side.

2. Measurements of both ends of hatch cover skirt plate, coaming plate and coaming flange.
3. One measurement (two points for web plate and one point for face plate) of one out of three hatch coaming brackets and bars, on both sides and both ends.

Figure 5.1.9.3(3)b Locations of Measurements on Hatch Covers and Coamings



Note: The gauging pattern for web plating is to be a three point pattern for zones A, C and D, and a two point pattern for zone B (see Figure). The gauging report is to reflect the average reading. The average reading is to be compared with the allowable thickness. If the web plating has general corrosion, then this pattern is to be expanded to a five-point pattern.

Figure 5.1.9.3(3)k

Locations of Measurements on Transverse Bulkheads of Topside, Hopper and Double Bottom Tanks (two additional measurements to internal structure of double bottom tank to be added at midspan)

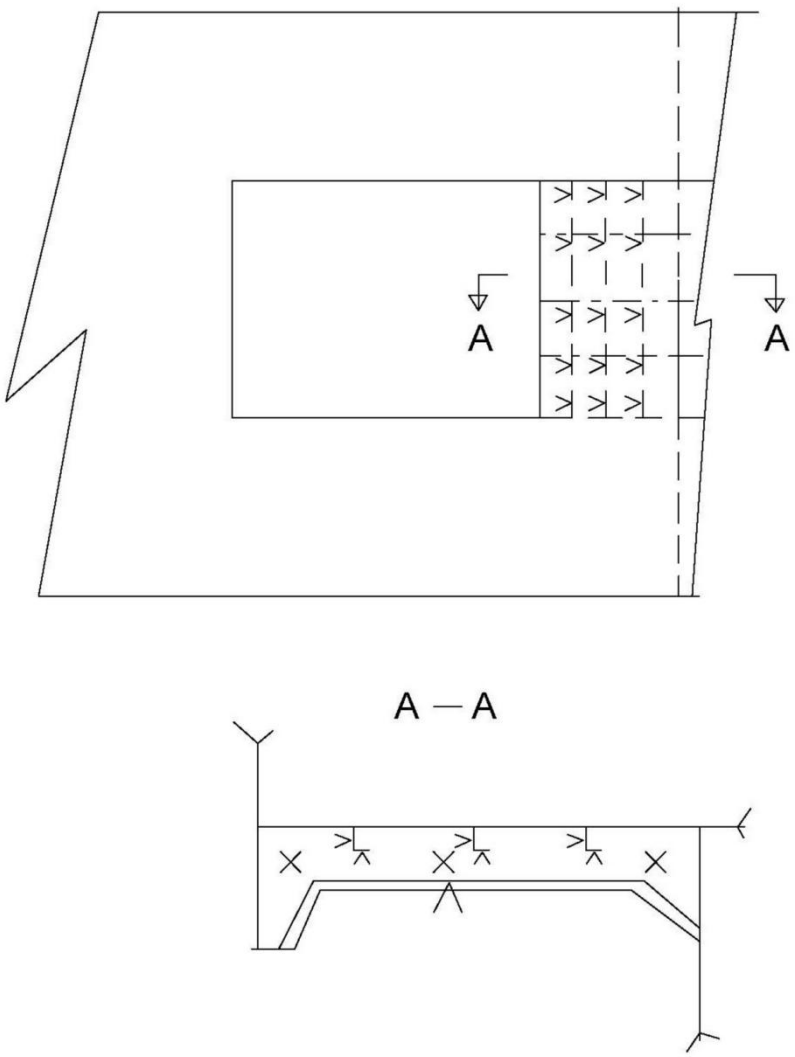

Figure 5.1.9.3(3)l Locations of Measurements on Underdeck Structure

Interpretations of Rule Requirements for the Locations and Number of Points to Be Measured for CSR Oil Tankers **Table 5.1.9.3(3)c**

Item	Interpretation	Figure reference
Selected plates	"Selected" means at least a single point on one out of three plates, to be chosen on representative areas of average corrosion	
Deck, bottom plates and wind-and-water strakes	At least two points on each plate to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion	
Transverse section	Measurements to be taken on all longitudinal members such as plating, longitudinals and girders at the deck, side, bottom, longitudinal bulkheads, inner bottom and hopper. One point to be taken oneach plate. Both web and flange to be measured on longitudinals, if applicable. For tankers older than 10 years of age: within 0.1*D* (where *D* is the moulded depth) of the deck and bottom at each transverse section to be measured, every longitudinal and girder is to be measured on the web and face plate, and every plate is to be measured at one point between longitudinals	Figure 5.1.9.3(3)m
Transverse rings① in cargo and ballast tanks	At least two points on each plate in a staggered pattern and two points on the corresponding flange where applicable. Minimum 4 points on the first plate below deck. Additional points in way of curved parts. At least one point on each of two stiffeners between stringers/ longitudinal	Figure 5.1.9.3(3)n
Transverse bulkheads in cargo tanks	At least two points on each plate. Minimum 4 points on the first plate below main deck. At least one point on every third stiffener to be taken between each stringer. At least two points on each plate of stringers and girders, and two points on the corresponding flange. Additional points in way of curved part. Two points of each diaphragm plate of stools if fitted	Figure 5.1.9.3(3)o
Transverse bulkheads in ballast tanks	At least 4 points on plates between stringers/longitudinal girders, or per plate if stringers/girders not fitted. At least two points on each plate of stringers and girders, and two points on the corresponding flange. Additional points in way of curved part. At least one point on two stiffeners between each stringer/longitudinal girder	Figure 5.1.9.3(3)p
Adjacent structural members	On adjacent structural members one point per plate and one point on every third stiffener/longitudinal	

① Transverse rings means all transverse material appearing in a cross-section of the ship's hull, in way of a double bottom floor, vertical web and deck transverse.

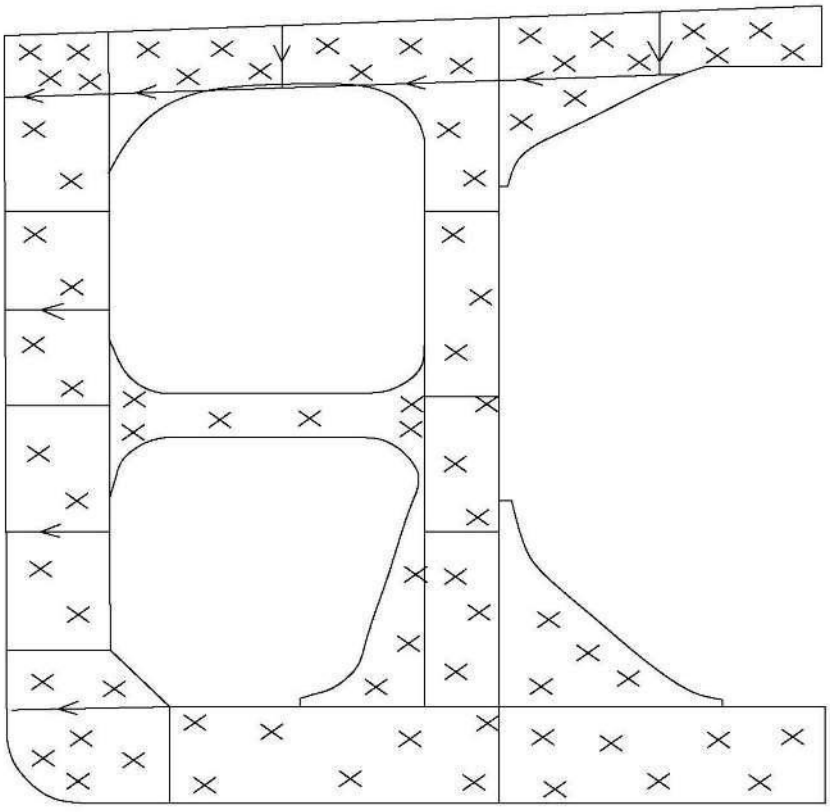

Figure 5.1.9.3(3)n Transverse Rings in Cargo and Ballast Tanks

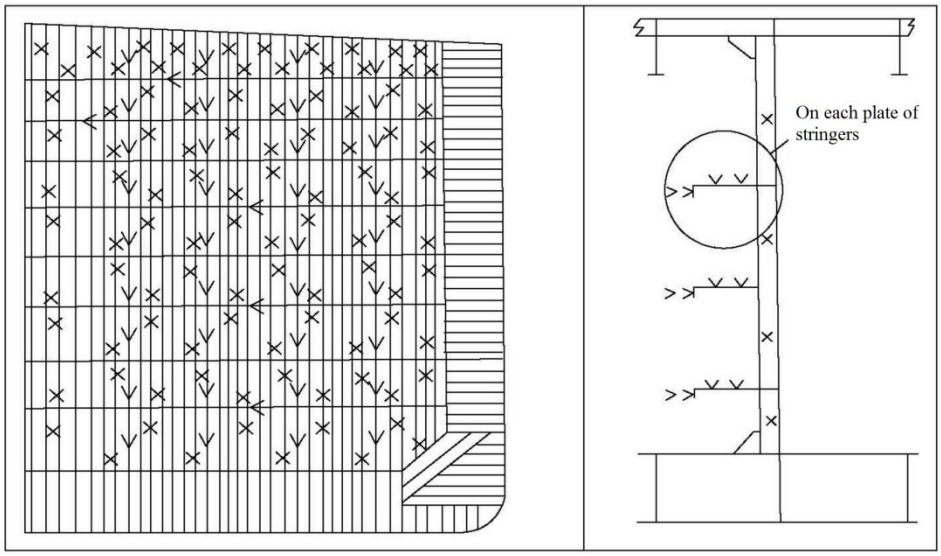

Figure 5.1.9.3(3)o Transverse Bulkheads in Cargo Tanks

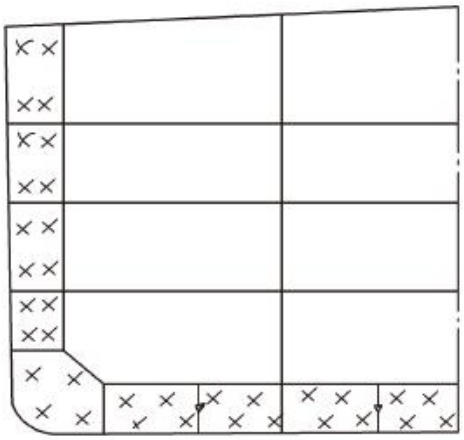

Figure 5.1.9.3(3)p Transverse Bulkheads in Ballast Tanks

5.1.9.4 Reporting

(1) A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measurement equipment, names of personnel and their qualifications and has to be signed by the operator. The thickness measurement report is to follow the principles as specified in the Recommended Procedures for Thickness Measurements contained in Appendix 10 of this Chapter.

(2) The Surveyor is to review the final thickness measurement report and countersign the cover page.

5.1.9.5 Monitoring of the thickness measurement process onboard

(1) The Surveyor is to decide final extent and location of thickness measurements after completion of overall survey of representative spaces onboard.

(2) In case the owner prefers to commence the thickness measurements prior to the overall survey, then the Surveyor is to require that the planned extent and locations of thickness measurements are subject to confirmation during the overall survey. If necessary, the Surveyor may require additional thickness measurements to be taken.

(3) The Surveyor is to direct the gauging operation by selecting locations such that readings taken represent, on average, the condition of the structure for that area.

(4) Thickness measurements taken mainly to evaluate the extent of corrosion, which may affect the hull girder strength, are to be carried out in a systematic manner such that all longitudinal structural members are gauged, as required.

(5) Where thickness measurements indicate substantial corrosion or wastage in excess of allowable diminution, the Surveyor is to direct locations for additional thickness measurements in order to delineate areas of substantial corrosion and to identify structural members for repairs/renewals.

5.1.9.6 Review and verification

(1) Upon completion of the thickness measurements, the Surveyor is to confirm that no further gaugings are needed, or if necessary, specify additional gaugings.

(2) Where any reduction is allowed to the extent of thickness measurements after special considerations by the Surveyor, these special considerations are to be reported, where appropriate.

(3) In case thickness measurements are partly carried out, the extent of remaining thickness measurements is to be reported for the use of the next Surveyor.

5.1.10 Repairs

5.1.10.1 Any damage in association with wastage over the allowable limits (including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the ship's structural, watertight or weathertight integrity, is to be promptly and thoroughly repaired (see 5.1.5.1(8)).

(1) Areas to be considered for all ships include:

① side shell frames, their end attachments and adjacent shell plating;

② deck structure and deck plating;

③ bottom structure and bottom plating;

④ watertight or oiltight bulkheads;

⑤ hatch covers and coamings;

⑥ items in 5.4.2.2(2)⑥.

(2) Consideration is to be given to adding the following areas for bulk carriers including double side skin bulk carriers:

① side structure and side plating;

② inner bottom structure and inner bottom plating;

③ inner side structure and inner side plating;

④ annual survey items in 5.7.2.3(7) of Section 7 of this Chapter.

(3) Consideration is to be given to adding the following areas for oil tankers including double hull oil tankers:

① side structure and side plating;

② hatch covers or hatch coamings, where fitted (combination carriers).

(4) If it is difficult to complete the above repairs in the port where the above defects are found and with the consent of CCS, consideration may be given to allow the ship to proceed directly to a port with adequate repair facilities for completing the repairs. This may require discharging the cargo and/or temporary repairs for the intended voyage.

(5) Where the damage found on structure mentioned in paragraph 5.1.10.1(1) is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the Surveyor to allow an appropriate temporary repair to restore watertight or weathertight integrity and impose a condition of class as required, with a specific time limit.

5.1.10.2 When a survey results in the identification of substantial corrosion or structural defects, either of which, in the opinion of the Surveyor, will impair the ship's fitness for continued service, remedial measures are to be implemented before the ship continues in service.

5.1.10.3 Where repairs to hull, machinery or equipment, which affect or may affect classification, are to be carried out by a riding crew during a voyage, they are to be planned in advance. A complete repair procedure including the extent of proposed repair and the need for Surveyor's attendance during the voyage is to be submitted to and agreed by CCS reasonably in advance. Failure to notify CCS, in advance of the repairs, may result in suspension of the ship's class. For surveys of voyage repairs, refer to Appendix 7 of this Chapter.

5.1.10.4 The ship's repairs are to be in compliance with Appendix 2 to Chapter 4 of this PART − Shipbuilding and Repair Quality Standard or the recognized standards acceptable to CCS.

5.1.11 Thickness measurements and close-up surveys

5.1.11.1 In any type of survey, i.e. special, intermediate, annual or other surveys having the scope of the foregoing ones, thickness measurements of structures in areas where close-up surveys are required, are to be carried out simultaneously with close-up surveys.

5.1.11.2 Consideration may be given by the attending Surveyor to allow use of Remote Inspection Techniques (RIT) as an alternative to close-up survey. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor. When RIT is used for a close-up survey, temporary means of access for the corresponding thickness measurements as specified in this Chapter is to be provided unless such RIT is also able to carry out the required thickness measurements.

5.1.11.3 For structure built with a material other than steel, alternative thickness measurement requirements may be developed and applied as deemed necessary by CCS.

5.1.12 ESP Survey

5.1.12.1 On ships of 20,000 tonnes DWT and above, subject to ESP, starting with special survey No.3 at special and intermediate hull classification surveys, surveys of hull structures and piping systems in way of cargo holds / cargo tanks, cofferdams, cargo pump rooms, pipe tunnels, void spaces and the selected fuel oil tanks of bulk carriers within the cargo length area and all ballast tanks are to be performed by at least two qualified exclusive Surveyors at the same time.

5.1.12.2 On bulk carriers of single side skin construction and 100,000 DWT and above, the intermediate hull classification survey between 10 and 15 years of age, surveys of hull structures and piping systems in way of cargo holds, cofferdams, pipe tunnels, void spaces and the selected fuel oil tanks within the cargo length area and all ballast tanks are to be performed by at least two qualified exclusive Surveyors at the same time.

5.1.12.3 Where compatible with relevant laws and regulations, on dual class ships, the requirement for two Surveyors in 5.1.12.1 and/or 5.1.12.2 may be fulfilled by having one Surveyor attend from CCS and the Society related to the dual class.

5.1.13 Owner's hull inspection and maintenance schemes

5.1.13.1 CCS encourages owners to implement hull inspection and maintenance schemes as a means for maintaining compliance with classification and statutory requirements between surveys. However, these schemes are not to be accepted as an alternative to, or a substitute for, the performance of required classification and/or statutory surveys of the hull by CCS Surveyors. Where the hull inspection and maintenance scheme complies with relevant requirements of CCS Guidelines for Hull Inspection and Maintenance Scheme, class notation HIMS may be assigned.

5.1.14 Attendance for survey of ships detained by port States

5.1.14.1 The owner or the master is to notify CCS on all occasions when a ship is being detained by a port State authority, or the flag Administration has found deficiencies which affect the ship's classification or statutory certificates issued by CCS, prior to the ship's departure in order that CCS Surveyor may attend and carry out a survey for the purpose of assessing and insuring the correction, if necessary, of the reported deficiencies or other matters which affect or may affect classification or the validity of statutory certificates issued by CCS. If the Surveyor is not able to attend for any reason, CCS will notify the owner to arrange for attendance in the next port of call.

5.1.14.2 Should an owner not notify CCS of a detention, then CCS reserves the right to suspend or cancel classification of the ship or invalidate the related statutory certificate(s).

5.1.15 Attendance at port State request

5.1.15.1 In cooperation with the port State, CCS Surveyor will attend on board a classed ship when so requested by the Port State, and upon concurrence by the ship's master, will carry out a survey in order to facilitate the rectification of reported deficiencies or other discrepancies that affect or may affect classification.

5.1.15.2 CCS Surveyor will also provide inspectors of the port State with background information (e.g. conditions of class, due dates of surveys, and expiry dates of certificates), if requested.

5.1.16 Ships' safety management system

5.1.16.1 If during any survey, the attending CCS Surveyor finds evidence that the ship's safety management system is not in operation or functioning as required by the ISM Code, this will be communicated to the relevant flag Administration or the organization which issued the Safety Management Certificate on behalf of the flag Administration for their consideration and action.

5.1.17 Acceptance criteria

(1) General

① For CSR ships, the acceptance criteria are in accordance with Common Structural Rules[①] and as specified in (2) to (4) below.

② For non-CSR ships, the acceptance criteria are in accordance with the relevant requirements of Appendix 1 of this Chapter depending on ship's age and structural elements concerned, e.g. where applicable, 2.4 for corrugated transverse watertight bulkheads, 2.7 for the corrugated transverse watertight bulkheads between cargo holds Nos.1 and 2, 2.5 for all cargo hatch covers and hatch forward and side coamings on exposed decks in position 1, as defined in ILLC and 2.8 for side shell frames.

(2) Acceptance criteria for pitting corrosion of CSR ships

① Side structures of bulk carriers

If pitting intensity in an area where coating is required, according to Common Structural Rules[②] is higher than 15% (see Figure 5.1.5.1(20)), thickness measurements are to be performed to check the extent of pitting corrosion. The 15% is based on pitting or grooving on only one side of a plate.

In cases where pitting is exceeding 15%, as defined above, an area of 300 mm or more, at the most pitted part of the plate, is to be cleaned to bare metal and the thickness is to be measured in way of the five deepest pits within the cleaned area. The least thickness measured in way of any of these pits is to be taken as the thickness to be recorded.

The minimum remaining thickness in pits, grooves or other local areas is to be greater than:

(a) 75% of the as-built thickness, in the frame and end brackets webs and flanges;

(b) 70% of the as-built thickness, in the side shell, hopper tank and topside tank plating attached to the each side frame, over a width up to 30 mm from each side of it,

without being greater than t_{ren}.

② Other structures

For plates with pitting intensity less than 20% (see Figure 5.1.5.1(20)), the measured thickness t_m of any individual measurement is to meet the lesser of the following criteria:

$$t_m \geq 0.7\ (t_{as-built} - t_{vol\ add})\ \text{mm}$$

$$t_m \geq t_{ren} - 1\ \ \text{mm}$$

where:

$t_{as\text{-}built}$ As-built thickness of the member, in mm;

$t_{vol\ add}$ Voluntary thickness addition; thickness, in mm, voluntarily added as the Owner's extra margin for corrosion wastage in addition to t_C;

t_{ren} Renewal thickness; minimum allowable thickness, in mm, below which renewal of structural members is to be carried out. For oil tankers, t_{ren} is renewal criteria for general

---

① Section 12 "Ship in Operation Renewal Criteria", PART NINE and Chapter 13 "Ships in Operation, Renewal Criteria", PART TEN of the Rules (2012 version) and its 2013 and 2014 amendments or Chapter 13, PART 9-1 of the Rules (2015 version) and its subsequent versions (including amendments).

② Section 5, Chapter 3 of PART TEN of the Rules (2012 version) and its 2013 and 2014 amendments or Section 4, Chapter 3, PART 9-1 of the Rules (2015 version) and its subsequent versions (including amendments).

corrosion as defined in Common Structural Rules[①];

t_C Total corrosion addition, in mm, defined in Common Structural Rules[②];

t_m Measured thickness, in mm, on one item, i.e. average thickness on one item using the various measurements taken on this same item during periodical ship's in service surveys.

The average thickness across any cross section in the plating is not to be less than the renewal criteria for general corrosion given in Common Structural Rules[③].

(3) Acceptance criteria for edge corrosion of CSR ships

① Provided that the overall corroded height of the edge corrosion of the flange, or web in the case of flat bar stiffeners, is less than 25%, see Figure 5.1.5.1(21), of the stiffener flange breadth or web height, as applicable, the measured thickness, t_m, is to meet the lesser of the following criteria:

$$t_m \geq 0.7\ (t_{as-built} - t_{vol\ add})\ \text{mm}$$

$$t_m \geq t_{ren} - 1\ \text{mm}$$

② The average measured thickness across the breadth or height of the stiffener is not to be less than that defined in Common Structural Rules[④].

③ Plate edges at openings for manholes, lightening holes etc. may be below the minimum thickness given in Common Structural Rules[①] provided that:

(a) the maximum extent of the reduced plate thickness, below the minimum given in Common Structural Rules[①], from the opening edge is not more than 20% of the smallest dimension of the opening and does not exceed 100 mm;

(b) rough or uneven edges may be cropped-back provided that the maximum dimension of the opening is not increased by more than 10% and the remaining thickness of the new edge is not less than t_{ren} – 1 mm.

(4) Acceptance criteria for grooving corrosion of CSR ships

① Where the groove breadth is a maximum of 15% of the web height, but not more than 30 mm, see Figure 5.1.5.1(22), the measured thickness, t_m, in the grooved area is to meet the lesser of the following criteria:

$$t_m \geq 0.75\ (t_{as-built} - t_{vol\ add})\ \text{mm}$$

$$t_m \geq t_{ren} - 0.5\ \text{mm}$$

but is not to be less than

$$t_m = 6\ \text{mm}$$

② Structural members with areas of grooving greater than those in ①above are to be assessed based on the criteria for general corrosion as defined in Common Structural Rules[①] using the average measured thickness across the plating/stiffener.

5.1.18 Remote Inspection Techniques (RIT)[⑤]

5.1.18.1 The RIT is to provide the information normally obtained from a close-up survey. RIT surveys are to be carried out in accordance with the requirements given here-in and the requirements of IACS Recommendation 42 'Guidelines for Use of Remote Inspection Techniques for surveys'. These considerations are to be included in the proposals for use of a RIT which are to be submitted in advance of the survey so that satisfactory arrangements can be agreed with CCS.

5.1.18.2 The equipment and procedure for observing and reporting the survey using a RIT are to be discussed and agreed with the parties involved prior to the RIT survey, and suitable time is to be allowed to set-up, calibrate and test all equipment beforehand.

5.1.18.3 When using a RIT as an alternative to close-up survey, if not carried out by CCS itself, it is to be conducted by a firm approved as a service supplier according to Appendix 8 of this Chapter and is to be witnessed by an attending surveyor of CCS.

5.1.18.4 The structure to be examined using a RIT is to be sufficiently clean to permit meaningful

---

① 1.4.2.1, Section 12, PART NINE of the Rules (2012 version) and its 2013 and 2014 amendments or 2.1.1, Section 2, Chapter 13, PART 9-1 of the Rules (2015 version) and its subsequent versions (including amendments).

② Section 3, Chapter 3, PART TEN of the Rules (2012 version) and its 2013 and 2014 amendments or Section 3, Chapter 3, PART 9-1 of the Rules (2015 version) and its subsequent versions (including amendments).

③ 1.4.2.1, Section 12, PART NINE or Chapter 13, PART TEN of the Rules (2012 version) and its 2013 and 2014 amendments or Chapter 13, PART 9-1 of the Rules (2015 version) and its subsequent versions (including amendments).

④ 1.4.2, Section 12, PART NINE or Chapter 13, PART TEN of the Rules (2012 version) and its 2013 and 2014 amendments or Chapter 13, PART 9-1 of the Rules (2015 version) and its subsequent versions (including amendments).

⑤ Remote Inspection Techniques (RIT) is applicable to survey of ships specified in Sections 4, 5, 8 and 16 of this Chapter.

examination. Visibility is to be sufficient to allow for a meaningful examination. CCS is to be satisfied with the methods of orientation on the structure.

5.1.18.5 The Surveyor is to be satisfied with the method of data presentation including pictorial representation, and a good two-way communication between the Surveyor and RIT operator is to be provided.

5.1.18.6 If the RIT reveals damage or deterioration that requires attention, the Surveyor may require traditional survey to be undertaken without the use of a RIT.

5.1.19 Remote survey

5.1.19.1 Remote survey carried out on or after 1 January 2023 is to comply with the requirements of Appendix 24 of this Chapter. For CCS specific requirements about remote survey, refer to CCS Guidelines for Remote Survey of Ships..

Section 2 TYPES AND PERIODS OF SURVEYS

5.2.1 Annual surveys

5.2.1.1 Annual surveys are to be carried out on all ships within 3 months before or after each anniversary date from the date of the initial classification survey or of the completion of the last special survey. The surveys are to be carried out in accordance with the relevant requirements of Sections 4 to 10 of this Chapter.

5.2.2 Intermediate surveys

5.2.2.1 Intermediate surveys are to be carried out on all ships either at or between the 2nd and 3rd annual survey. Those items which are additional to the requirements of the annual surveys may be surveyed either at or between the 2nd and 3rd annual survey. The surveys are to be carried out in accordance with the relevant requirements of Sections 4 to 10 of this Chapter.

5.2.2.2 Concurrent crediting to both intermediate survey and special survey for surveys and thickness measurements of spaces are not acceptable.

5.2.3 Periodical surveys of the outside of the ship's bottom and related items

5.2.3.1 Examinations of the outside of the ship's bottom and related items of ships may be carried out with the ship in dry dock or on a slipway, or while the ship is afloat. The examinations in dry dock or on a slipway are considered as docking surveys and the examinations with the ship afloat as in-water surveys.

5.2.3.2 The owner is to notify CCS whenever the outside of the ship's bottom and related items can be examined in dry dock or on a slipway.

5.2.3.3 There is to be a minimum of two examinations of the outside of the ship's bottom and related items during each five-year special survey period. One such examination is to be carried out in conjunction with the special survey. In all cases the interval between any two such examinations is not to exceed 36 months. An extension of examination of the ship's bottom of 3 months beyond the due date may be granted in exceptional circumstances①. The surveys are to be carried out in accordance with relevant requirements in Section 11 of this Chapter.

5.2.3.4 Examinations of the outside of the ship's bottom and related items of ships are normally to be carried out with the ship in dry dock. However, consideration may be given to alternate examination while the ship is afloat as an in-water survey, subject to the provisions of Section 11 of this Chapter. Ships of less than 15 years of age may be permitted to carry out two consecutive in-water surveys, provided that relevant requirements of Appendix 21 of this Chapter are complied with. Special consideration is to be given to ships of 15 years or over before being permitted to have such examinations. For ESP ships of 15 years of age or over, such examinations are to be carried out with the ship in dry dock.

5.2.3.5 The interval between examinations of the outside of the ship's bottom and related items for ships operating in fresh water and for certain harbour or non-self-propelled craft may be greater than that given in 5.2.3.3.

5.2.3.6 Compliance with the requirements of the Rules for periodical surveys of the outside of the ship's bottom and related items does not absolve the owner from compliance with the requirements of SOLAS, as amended, especially when shorter intervals between examinations of the ship's bottom for certain types of ships are required.

---

① As defined in 2.1.3.1(28) of Chapter 2 of this PART.

5.2.3.7 For oil tankers, combination carriers, bulk carriers, chemical tankers, double hull oil tankers, double skin bulk carriers, general dry cargo ships and liquefied gas carriers, reference is also be made to the relevant requirements of Sections 5, 6, 7, 8 and 16 of this Chapter.
5.2.3.8 For passenger ships engaged on international voyages, the outside of the bottom of the ship is to be inspected once a year, for passenger ships engaged on non-international voyages, the outside of the bottom of the ship is to be inspected once every two years, and at least twice in dry-dock during each five-year special survey period. In-water surveys may be carried out in lieu of the others when the ship is afloat. The minimum number of inspections in dry-dock of the outside of the bottom of a passenger ship (which is not a ro-ro passenger ship) of 15 years of age or less during each five-year special survey period may be reduced from two to one if relevant technical requirements are met①. In such cases, the interval between consecutive inspections in dry-dock is not to exceed 60 months, unless otherwise specified by the flag Administration.

5.2.4 Special surveys
5.2.4.1 Hull and machinery (including electrical installations) are in general to be subject to special surveys at 5 years intervals to renew the classification certificate. The first special survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years from the credited date of the previous special survey. For ships to which the classification certificate is issued for less than 5 years, the period of the special survey may be shortened.
5.2.4.2 The special survey may be commenced at the annual survey prior to its expiry date and be progressed during the succeeding year with a view to completion by its expiry date. When the special survey is commenced before the annual survey prior to its expiry date, the entire survey is to be completed within 15 months from the date of commencement of the special survey if such work is to be credited to the special survey.
5.2.4.3 Where the owner is not able to arrange the special survey by its expiry date in exceptional circumstances and upon the owner's request, CCS may grant an extension in accordance with 2.9.2.1(4)③a and/or b , provided that a written application is received before the expiry date.
5.2.4.4 For surveys completed more than 3 months before the expiry date of the special survey, the date of next special survey for class is to start from the survey completion date. For surveys completed within 3 months before the expiry date of the special survey, the date of next special survey for class is to start from the expiry date of the special survey. For surveys completed after the expiry date of the special survey, the date of next special survey for class is also to start from the expiry date of the special survey. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date.
5.2.4.5 Concurrent crediting to both intermediate survey and special survey for surveys and thickness measurements of spaces are not acceptable.
5.2.4.6 The special surveys are to be carried out in accordance with the relevant requirements of Sections 4 to 10 of this Chapter.

5.2.5 Screwshaft and tubeshaft surveys
5.2.5.1 The screwshaft and tubeshaft surveys to be carried out and the interval between the surveys are to be in accordance with the requirements of Section 12 of this Chapter.

5.2.6 Boiler surveys
5.2.6.1 The boiler surveys to be carried out and the interval between the surveys are to be in accordance with the requirements of Section 13 of this Chapter.

5.2.7 Continuous surveys
5.2.7.1 Continuous survey system for hull
(1) Continuous system for hull survey is an alternative survey system for special survey and is applicable to ships other than general dry cargo ships, oil tankers, bulk carriers, combination carriers and chemical tankers.
(2) The complete survey of the hull to meet the requirements of the hull special survey, can be carried out on the continuous survey system basis, when, at the request of the owner it has been agreed by CCS②.

---

① Refer to MSC.1/Circ.1348.
② Ships on the continuous survey system are not exempt from other periodical surveys.

(3) When such a system is adopted, all the requirements of the particular hull special survey must be completed at the end of the five-year class period.
(4) During each survey cycle, all items are to be surveyed (and tested, where required) in regular rotation, as far as practicable, with uniform annual share within the five-year class period.
(5) The owner is entitled to fix the sequence in which the individual items of the hull are intended to be surveyed. However, the sequence in each survey cycle is to be linked with that of the previous one in such a way that the interval between consecutive (in two cycles) examinations of each item will not exceed five years. The survey in dry dock may be held at any time within the five-year class period, provided all the requirements of Section 11 of this Chapter are also complied with. For ships more than 10 years of age, the ballast tanks are to be internally examined twice in each five-year class period, i.e. once within the scope of the intermediate survey and once within the scope of the continuous system for the hull special survey.
(6) The Surveyor may extend the inspection, at his discretion, to other items if the inspections carried out revealed any defect.
(7) The agreement for surveys to be carried out on a continuous survey system basis may be withdrawn at the discretion of CCS.
5.2.7.2 Continuous survey system for machinery
(1) At the request of the owner and with the consent of CCS, all examination and test items of the special survey of the machinery (including electrical installations), other than those specified in 5.9.4.3(1) and (2) of this Chapter, may be carried out on the continuous survey basis.
(2) When the continuous survey is carried out, the various items for special survey of the machinery (including electrical installations), other than those specified in 5.9.4.3(1) and (2) of this Chapter, are to be examined in rotation, evenly distributed within the cycle of the special survey (5 years).
(3) The longest interval between consecutive examinations of each item is not to exceed 5 years. All items to be inspected are to be submitted to the Surveyors for examination after opening and cleaning, as in the special survey. Control, alarm and safety systems are in general to be checked only by operation test or simulation test.
(4) At the request of the owner, the chief engineer of the ship may examine the items authorized by CCS. On completion of the examination, the chief engineer is to make an entry in the continuous survey report about the items examined by him, and a survey report is to be submitted for confirmation at the time of the next survey.
(5) CCS at its discretion, or the owner in view of the implementation of the continuous survey system, may terminate this system at any time and apply special survey.

5.2.8 Survey of planned maintenance scheme (PMS) for machinery

5.2.8.1 For machinery and installations which are subject to planned maintenance and with the consent of CCS, the survey of planned maintenance scheme (for details, see Appendix 16 of this Chapter) may be introduced to replace the continuous survey, provided that:
(1) a maintenance plan for all machineries, installations and equipment on board the ship is approved by CCS;
(2) crew members implementing the plan are to follow the approved maintenance plan, carry out planned maintenance and make relevant records;
(3) the records for implementing planned maintenance are examined once every year to confirm that the plan is well implemented.
5.2.8.2 When it is found upon examination of the records that the planned maintenance is not able to fully meet the requirements of surveys after construction, such scheme implemented will be canceled. Special survey or continuous survey will then be carried out.

5.2.9 Lay-up surveys

5.2.9.1 General requirements
(1) The owner is to inform CCS of any ship laid up with CCS class in writing.
(2) For maintaining the class of laid-up ships:
① initial lay-up survey is to be requested at the beginning of the lay-up period;
② annual lay-up condition survey is to be carried out during the lay-up period;
③ reactivation survey is to be requested at the termination of the lay-up period.
(3) Where a maintenance scheme agreed by CCS is available for a ship being laid up for a period beyond due date of the special classification survey, all surveys after construction which fall due during lay-up will then be held in abeyance until it is reactivated, subject to satisfactory completion of the annual lay-up condition survey stated in (2)② above.

(4) At the request of the owner, part or all of surveys after construction may be carried out for a laid-up ship, with particular attention being given to the scope and date of the surveys. Such surveys may be taken into account for determining the scope of a reactivation survey and/or determining the due date of next survey of the same type after construction.

5.2.9.2 Initial lay-up surveys

(1) The purpose of the survey at the beginning of the lay-up period is to confirm compliance of safety condition, maintenance measures, location and mooring arrangement of the ship with the lay-up maintenance scheme agreed by CCS. The scope and requirements of the survey may be in accordance with the relevant requirements of CCS Guidelines on Lay-up of Ships.

(2) Upon satisfactory completion of the initial lay-up survey, the lay-up report is to be issued and the classification certificate endorsed to the effect that the ship is laid up.

5.2.9.3 Annual lay-up condition surveys

(1) An annual lay-up survey is to be carried out, in lieu of the normal annual survey during the lay-up period, to determine whether the ship remains in compliance with the lay-up maintenance scheme. The scope of the survey is to include checking whether the lay-up arrangement has been changed, and whether the ship maintenance and testing have been carried out in accordance with the maintenance requirements and recorded in the lay-up log.

(2) Ships manned during lay-up are to comply with the requirements regarding fire safety. The requirements may be limited to engine room areas and any high fire risk area, if such ships are laid up in ballast condition and that cargo areas are clean and gas free.

(3) Upon satisfactory completion of the survey, the classification certificate is to be endorsed.

5.2.9.4 Reactivation surveys

(1) The owner is to inform CCS of termination of the lay-up period and apply for the following surveys prior to reactivation of the ship:

① an occasional survey, the scope of which depends on the duration of the lay-up period and the surveys carried out during the lay-up period;

② all other surveys after construction that are being held in abeyance according to 5.2.9.1(3), taking into account the requirements of 5.2.9.1(4).

(2) Where the date of reactivation is beyond the original due date of the special survey which is held in abeyance according to 5.2.9.1(3), and where surveys have been carried out according to 5.2.9.1(4), a complete special survey is to be carried out prior to the reactivation. Those items which have been surveyed in compliance with the special classification survey requirements within 15 months preceding the reactivation may be credited.

(3) Scope of reactivation surveys: The scope and requirements of the survey are to be in accordance with the relevant requirements of CCS Guidelines on Lay-up of Ships.

(4) Upon completion of the survey, the classification certificate is to be re-issued.

5.2.10 Initial classification surveys

5.2.10.1 An initial classification survey of a ship requesting to be classed with CCS is the examination of compliance of its documentation and of the design, configuration, technical condition and management of its structure and equipment with CCS rules and regulations for classification and other technical requirements recognized by it, prior to assigning CCS class and classification certificates to it for the first time.

5.2.10.2 The initial classification surveys of the existing ships and the ships constructed not under the supervision of CCS are to be carried out in accordance with the relevant requirements of Section 14 of this Chapter.

5.2.10.3 The initial classification surveys of newbuildings are to be carried out in accordance with the requirements of Chapter 4 of this PART for surveys during construction.

5.2.11 Occasional surveys

5.2.11.1 An occasional survey is any survey which is not a periodical survey. The survey may be defined as an occasional survey of hull, machinery, boilers, electrical installations, automatic and remote control systems, etc., depending on the part of the ship concerned.

5.2.11.2 An occasional survey is to be requested by the owner or his agent in any of the following cases:

(1) change of the ship' name, port of registry, flag and the owner or operator;

(2) damage which affects the class of the ship or its equipment;

(3) port State control inspection;

(4) any repair or alteration or conversion which affects class;

(5) postponement of surveys or recommendations.

5.2.11.3 An occasional survey may be general or partial as appropriate, and is to ensure that repairs and any renewal have been effectively carried out and that the ship and its equipment remain fit for the intended service.

Section 3 RETROSPECTIVE REQUIREMENTS FOR EXISTING SHIPS

5.3.1 General requirements

5.3.1.1 This Section contains class-related retrospective requirements of SOLAS Convention and/or IACS URs for the existing self-propelled ships engaged on international voyages.

5.3.2 Construction – structure, subdivision and stability, machinery and electrical installations

5.3.2.1 Safe access to tanker bows

(1) Application:

① every tanker constructed on or after 1 July 1998;

② for tankers constructed before 1 July 1998, such means of access are to be provided at the first scheduled dry-docking after 1 July 1998, but not later than 1 July 2001.

(2) Technical requirements: see Section 12, Chapter 1 of PART TWO of the Rules.

5.3.2.2 Emergency towing arrangements on tankers

(1) Application:

① every tanker of not less than 20,000 tonnes deadweight constructed on or after 1 July 2002;

② for tankers of not less than 20,000 tonnes deadweight constructed before 1 July 2002, the design and construction of emergency towing arrangements are to be approved.

(2) Technical requirements: see Section 5, Chapter 3 of PART TWO of the Rules.

5.3.2.3 Stability of ro-ro passenger ships in damaged condition

(1) Application:

① ro-ro passenger ships constructed on or after 1 January 2009 are to comply with Section 10, Chapter 1 of PART TWO of the Rules;

② ro-ro passenger ships constructed on or after 1 July 1997 and before 1 January 2009 are to comply with the November 1995 amendments, which were adopted by resolution 1 of the Conference of Contracting Governments to SOLAS, 1974 and amendments adopted by resolution MSC.47(66);

③ ro-ro passenger ships constructed before 1 July 1997 are to comply with the Rules not later than the date of the first periodical survey after the date of compliance prescribed in Table 5.3.2.3(1), according to the value of A/A_{max}.

Table 5.3.2.3(1)

Value of A/A_{max}	Compliance not later than
Less than 85%	1 October 1998
85% or more but less than 90%	1 October 2000
90% or more but less than 95%	1 October 2002
95% or more but less than 97.5%	1 October 2004
97.5% or more	1 October 2005

5.3.2.4 Special requirements for ro-ro passenger ships certified to carry 400 persons or more

(1) Application: Notwithstanding the requirements of 5.3.2.3:

① ro-ro passenger ships constructed on or after 1 January 2009 are to comply with Section 10, Chapter 1 of PART TWO of the Rules;

② ro-ro passenger ships certified to carry 400 persons or more constructed on or after 1 July 1997 and before 1 January 2009 are to comply with the November 1995 amendments, which were adopted by resolution 1 of the Conference of Contracting Governments to SOLAS, 1974 and amendments adopted by resolution MSC.47(66);

③ ro-ro passenger ships certified to carry 400 persons or more constructed before 1 July 1997 are to comply with the requirements of ② of this paragraph not later than the date of the first periodical survey after the date of compliance prescribed in Tables 5.3.2.4(1)① and 5.3.2.4(1)② or age of the ship[①] equal to or greater than 20 years, whichever is the latest.

Table 5.3.2.4(1)①

① The age of the ship means the time counted from the date on which the keel was laid or the date on which it was at a similar stage of construction or from the date on which the ship was converted to a ro-ro passenger ship.

Value of A/A_{max}	Compliance not later than
Less than 85%	1 October 1998
85% or more but less than 90%	1 October 2000
90% or more but less than 95%	1 October 2002
95% or more but less than 97.5%	1 October 2004
97.5% or more	1 October 2010

Table 5.3.2.4(1)②

Number of persons permitted to be carried	Compliance not later than
1,500 or more	1 October 2002
1,000 or more but less than 1,500	1 October 2006
600 or more but less than 1,000	1 October 2008
400 or more but less than 600	1 October 2010

5.3.2.5 Openings in watertight bulkheads in passenger ships
(1) Application: Ships constructed on or after 1 February 1992.
(2) Technical requirements: see Section 12, Chapter 1 of PART TWO of the Rules.
5.3.2.6 Construction and initial tests of watertight decks, trunks, etc., in ro-ro passenger ships
(1) Ro-ro passenger ships constructed before 1 July 1997 are to comply with the requirements of the Rules not later than the date of the first periodical survey after 1 July 1997.
(2) Technical requirements: see Section 12, Chapter 1 of PART TWO of the Rules.
5.3.2.7 Watertight integrity of the ro-ro deck (bulkhead deck) and below the ro-ro deck
(1) Application:
① ro-ro passenger ships constructed on or after 1 July 1997;
② ro-ro passenger ships constructed before 1 July 1997 are to comply with the requirements of the Rules not later than the date of the first periodical survey after 1 July 1997.
(2) Technical requirements: see Section 12, Chapter 1 of PART TWO of the Rules.
5.3.2.8 Integrity of the hull and superstructure, damage prevention and control
(1) Application: All ro-ro passenger ships constructed before 1 January 2009 are to comply with regulation 23-2 of the November 1995 amendments, which were adopted by resolution 1 of the Conference of Contracting Governments to SOLAS, 1974, but ro-ro passenger ships constructed before 1 July 1997 are to comply with paragraph 2 of regulation 23-2 of the above-mentioned amendments not later than the date of the first periodical survey after 1 July 1997.
5.3.2.9 Supplementary emergency lighting for ro-ro passenger ships
(1) Application: All ro-ro passenger ships, except that for ships constructed before 22 October 1989, this requirement is to apply not later than 22 October 1990.
(2) Technical requirements: see 2.2.2.3 of Chapter 2 of PART FOUR of the Rules.

5.3.3 Construction –Fire protection, fire detection and fire extinction

5.3.3.1 Protection of cargo pump-rooms in tankers
(1) Application: All tankers constructed before 1 July 2002 are to be fitted with the devices and a system for continuous monitoring of the concentration of hydrocarbon gases as required, at the first scheduled dry-docking after 1 July 2002, but not later than 1 July 2005.
(2) Technical requirements: see 1.1.1.1 of PART SIX of the Rules (SOLAS Reg. II-2/4.5.10.1.1 and 4.5.10.1.4).
5.3.3.2 Carriage of emergency escape breathing devices
(1) Application: All ships constructed before 1 July 2002 are to carry the required emergency escape breathing devices not later than the date of the first survey after 1 July 2002.
(2) Technical requirements: see 1.1.1.1 of PART SIX of the Rules (SOLAS Reg. II-2/13.3.4.2 to 13.3.4.5 and 13.4.3).
5.3.3.3 Part E, Operational requirements of SOLAS II-2
(1) Application: All ships constructed before 1 July 2002 are to comply with the relevant requirements not later than the date of the first survey after 1 July 2002.
(2) Technical requirements: see 1.1.1.1 of PART SIX of the Rules (relevant requirements of SOLAS II-2/Part E, excluding Reg. 16.3.2.2 and 16.3.2.3).
5.3.3.4 Fire-extinguishing systems using Halon 1211, 1301, and 2402 and perfluorocarbons
(1) Application: New installation of such systems is prohibited for all ships constructed before 1 July 2002.
(2) Technical requirements: see 1.1.1.1 of PART SIX of the Rules (SOLAS Reg. II-2/10.4.1.3).
5.3.3.5 Deep-fat cooking equipment
(1) Application: New installation of such equipment or replacement of the existing equipment with such

equipment for all ships constructed before 1 July 2002 is to comply with the relevant requirements.
(2) Technical requirements: see 1.1.1.1 of PART SIX of the Rules (SOLAS Reg. II-2/10.6.4).
5.3.3.6 Fixed water-based local application fire-extinguishing system
(1) Application: Passenger ships and ro-ro passenger ships of 2,000 gross tonnage and above constructed before 1 July 2002 are to be fitted with the required fixed water-based local application fire-extinguishing system not later than 1 October 2005.
(2) Technical requirements: see 1.1.1.1 of PART SIX of the Rules (SOLAS Reg. II-2/10.5.6).
5.3.3.7 Diesel engines: High-pressure fuel delivery lines protected with a jacketed piping system, surfaces with temperatures above 220℃ and isolation of fuel piping
(1) Application: All ships (ships to which the Rules apply, the same below) constructed on or after 1 February 1992 but before 1 July 1998 are to comply with the relevant requirements not later than 1 July 2003. However, an appropriate cover of the fuel injection pump serving more than one nozzles, in engines having a power output of 375 kW or below, may replace the required jacketed protection system.
(2) Technical requirements: see 1.1.1.1 of PART SIX of the Rules (SOLAS Reg. II-2/4.2.2.5.2, 4.2.2.5.3 and 4.2.2.6.1).
5.3.3.8 Secondary means for pressure/vacuum relief in cargo tanks
(1) Application: All tankers constructed before 1 July 1998 are to comply with the relevant requirements before the date of the first scheduled dry-docking after 1 July 1998, but not later than 1 July 2001.
(2) Technical requirements: see 1.1.1.1 of PART SIX of the Rules (SOLAS Reg. II-2/11.6.3.2 and 4.5.3.2.3).
5.3.3.9 Additional requirements for means of escape of ro-ro passenger ships
(1) Application: Ro-ro passenger ships constructed before 1 July 1997 are to comply with the relevant requirements at the date of the first periodical survey after 1 July 1997.
(2) Technical requirements: see 1.1.1.1 of PART SIX of the Rules (SOLAS Reg. II-2/13.7).
5.3.3.10 Inert gas systems
(1) Application: All tankers constructed before 1 September 1984:

① Tankers of 20,000 tonnes deadweight and upwards and carrying crude oil are to be fitted with a required inert gas system:
   a. for tankers of 70,000 tonnes deadweight and upwards, not later than 1 September 1984 or the date of delivery of the ship, whichever comes later;
   b. for tankers of less than 70,000 tonnes deadweight, not later than 1 May 1985 or the date of delivery of the ship, whichever comes later. However, tankers of less than 40,000 tonnes deadweight, which are not fitted with oil tank washing machines having an individual discharge capacity of more than 60 m^3/h, may not be fitted with the inert gas system.

② Tankers of 40,000 tonnes deadweight and upwards and carrying oils other than crude oil as well as tankers of 20,000 tonnes deadweight and upwards and carrying oils other than crude oil, both of which are fitted with oil tank washing machines having an individual discharge capacity of more than 60 m^3/h, are to be fitted with the required inert gas system:
   a. for tankers of 70,000 tonnes deadweight and upwards, not later than 1 September 1984 or the date of delivery of the ship, whichever comes later;
   b. for tankers of less than 70,000 tonnes deadweight, not later than 1 May 1985 or the date of delivery of the ship, whichever comes later.

(2) Technical requirements: see 1.1.1.2 of PART SIX of the Rules (Chapter 15 of the International Code for Fire Safety Systems (FSS Code)).

5.3.4 Additional safety measures for bulk carriers

5.3.4.1 Evaluation of scantlings of the transverse watertight corrugated bulkhead between cargo holds Nos.1 and 2, with cargo hold No.1 flooded, for existing bulk carriers
(1) These requirements apply to all bulk carriers of 150 m in length and above, in the foremost hold, intending to carry solid bulk cargoes having a density of 1.78 t/m^3 or above, with single deck, topside tanks and hopper tanks, fitted with vertically corrugated transverse watertight bulkheads between cargo holds Nos.1 and 2 where:

① the foremost hold is bounded by the side shell only for ships which were contracted for construction prior to 1 July 1998, and have not been constructed in compliance with IACS Unified Requirement S18; or

② the foremost hold is double side skin construction of less than 760 mm breadth measured perpendicular to the side shell in ships, the keels of which were laid, or which were at a similar stage of construction, before 1 July 1999 and have not been constructed in compliance with IACS Unified

Requirement S18 (Rev.2, Sept. 2000).

(2) Technical requirements: see Appendix 17 of this Chapter.

5.3.4.2 Evaluation of Allowable Hold Loading of cargo hold No.1 with cargo hold No.1 flooded, for existing bulk carriers

(1) Application: All bulk carriers of 150 m in length and above, in the foremost hold, intending to carry solid bulk cargoes having a density of 1.78 t/m^3 or above, with single deck, topside tanks and hopper tanks, where:

① the foremost hold is bounded by the side shell only for ships which were contracted for construction prior to 1 July 1998, and have not been constructed in compliance with IACS Unified Requirement S20; or

② the foremost hold is double side skin construction of less than 760 mm breadth measured perpendicular to the side shell in ships, the keels of which were laid, or which were at a similar stage of construction, before 1 July 1999 and have not been constructed in compliance with IACS Unified Requirement S20.

Early completion of a special survey coming due after 1 July 1998 to postpone compliance is not allowed.

(2) Technical requirements: see Appendix 18 of this Chapter.

5.3.4.3 Implementation of IACS Unified Requirements S19 and S22 for existing single side skin bulk carriers

(1) Application:

① The requirements for the corrugated bulkhead between cargo holds Nos.1 and 2 in 5.3.4.1 and the requirements for strengthening of double bottom structure of No.1 hold in 5.3.4.2 are to be applied in conjunction with the damage stability requirements set forth in this paragraph for withstanding flooding of the foremost cargo hold. The schedule for compliance is given in Table 5.3.4.3.

(2) Technical requirements: see Appendix 19 of this Chapter.

Table 5.3.4.3

No.	Age of ship	Schedule for compliance
1	20 years or more on 1 July 1998	Due date of the first intermediate survey, or due date of the first special survey to be held after 1 July 1998, whichever comes first
2	15 years or more but less than 20 years on 1 July 1998	Due date of the first special survey to be held after 1 July 1998, but not later than 1 July 2002
3	10 years or more but less than 15 years on 1 July 1998	Due date of the first intermediate survey or special survey to be held after the date on which the ship reaches 15 years of age but not later than the date on which the ship reaches 17 years of age
4	5 years or more but less than 10 years on 1 July 1998	Due date, after 1 July 2003, of the first intermediate or the first special survey after the date on which the ship reaches 10 years of age, whichever occurs first
5	Less than 5 years on 1 July 1998	The date on which the ship reaches 10 years of age

Notes: For the ships listed under No.4 of Table 5.3.4.3, attention is to be paid to the following:

① Where the due date of the intermediate or special survey is after 1 July 2003 (the due date of the intermediate survey means the third anniversary date of the annual survey) and the intermediate or special survey is completed before 1 July 2003, the evaluation required by 5.3.4.1, 5.3.4.2 and 5.3.4.3 is not allowed to be postponed, i.e. it is to be completed within 3 months after the due date of this intermediate survey or by the due date of the special survey.

② Where the due date of the intermediate survey is before 1 July 2003 and the intermediate survey is completed before 1 July 2003, this intermediate survey may be accepted, i.e. the evaluation required by 5.3.4.1, 5.3.4.2 and 5.3.4.3 may be performed at the first special survey after 1 July 2003.

5.3.4.4 Cargo hatch cover securing arrangements for bulk carriers

(1) Application: All bulk carriers which were not built in accordance with Section 11, Chapter 8 of PART TWO of the Rules.

(2) Schedule for compliance: The ships to which (1) applies are to comply with (3) in accordance with the following schedule:

① for ships which are 15 years of age or more on 1 January 2004 by the due date of the first intermediate or special survey after that date;

② for ships which are 10 years of age or more on 1 January 2004 by the due date of the first special survey after that date;

③ for ships which are less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.

Completion prior to 1 January 2004 of an intermediate or special survey with a due date after 1 January

2004 cannot be used to postpone compliance. However, completion prior to 1 January 2004 of an intermediate survey the window for which straddles 1 January 2004 can be accepted.
(3) Technical requirements: Hatch cover securing devices and stoppers for cargo hold hatchways No.1 and No.2 which are wholly or partially within 0.25 *L* of the fore perpendicular (except pontoon type hatch covers) are to comply with 8.11.5 of PART TWO of the Rules.

5.3.4.5 Renewal criteria for side shell frames and brackets in single side skin bulk carriers and single side skin OBO carriers

(1) Application:

① The requirements apply to the side shell frames and brackets of cargo holds bounded by the single side shell of bulk carriers which were not built in accordance with IACS UR S12[①] Rev. 1 or subsequent revisions.

② The requirements also apply to the side shell frames and brackets of cargo holds bounded by the single side shell of Oil/Bulk/Ore (OBO) carriers of single side skin construction.

(2) Schedule for compliance:

① Bulk carriers are to be assessed for compliance with the requirements and steel renewal, reinforcement or coating, where required, is to be carried out in accordance with the following schedule and at subsequent intermediate and special surveys:

a. for bulk carriers which are 15 years of age or more on 1 January 2004 by the due date of the first intermediate or special survey after that date;

b. for bulk carriers which are 10 years of age or more on 1 January 2004 by the due date of the first special survey after that date;

c. for bulk carriers which are less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.

Completion prior to 1 January 2004 of an intermediate or special survey with a due date after 1 January 2004 cannot be used to postpone compliance. However, completion prior to 1 January 2004 of an intermediate survey the window[②] for which straddles 1 January 2004 can be accepted.

② OBO carriers are to be assessed for compliance with the requirements and steel renewal, reinforcement or coating, where required, is to be carried out in accordance with the following schedule and at subsequent intermediate and special surveys:

a. for OBO carriers which are 15 years of age or more on 1 July 2005 by the due date of the first intermediate or special survey after that date;

b. for OBO carriers which are 10 years of age or more on 1 July 2005 by the due date of the first special survey after that date;

c. for OBO carriers which are less than 10 years of age on 1 July 2005 by the date on which the ship reaches 10 years of age.

Completion prior to 1 July 2005 of an intermediate or special survey with a due date after 1 July 2005 cannot be used to postpone compliance. However, completion prior to 1 July 2005 of an intermediate survey the window for which straddles 1 July 2005 can be accepted.

(3) The evaluation criteria are given in Appendix 20 of this Chapter.

5.3.4.6 Survey of the cargo hold structure of bulk carriers

Bulk carriers constructed before 1 July 1999, of 150 m in length and upwards of single side skin construction, of 10 years of age and over, are not to carry solid bulk cargoes having a density of 1.78 t/m^3 and above unless it has satisfactorily undergone either:
(1) a periodical survey in accordance with the enhanced programme of inspections required by SOLAS regulation XI-1/2; or
(2) a survey of all cargo holds to the same extent as required for periodical surveys in the enhanced survey programme of inspections required by regulation XI-1/2.

5.3.4.7 Requirements for the fitting of a forecastle

(1) Application: All bulk carriers (including ore carriers and combination carriers) which are contracted for construction on or after 1 January 2004, as defined in Appendix 2, Chapter 2 of this PART.
(2) Technical requirements: Section 13, Chapter 8 of PART TWO of the Rules is to be complied with.

5.3.4.8 Hold, ballast and dry space water level detectors

(1) Application: All bulk carriers of 500 gross tonnage and upwards and engaged on international voyages.
(2) Schedule for compliance:

① bulk carriers constructed on or after 1 July 2004 are to comply with the requirements of this

---

① IACS UR S12 - Side Structures in Single Side Skin Bulk Carriers.

② Windows means the time span allowed for completing a specific type of survey.

paragraph on the date of being commissioned;

② the water level alarm of bulk carriers constructed before 1 July 2004 is to comply with the requirements of this paragraph not later than the date of the annual, intermediate or special survey of the ship to be carried out after 1 July 2004, whichever comes first.

(3) Technical requirements: see Section 19, Chapter 2 of PART FOUR of the Rules.

5.3.4.9 Availability of pumping systems

(1) Application: Bulk carriers.

(2) Schedule for compliance: Bulk carriers constructed before 1 July 2004 are to comply with the requirements of this paragraph not later than the date of the first intermediate or special survey of the ship to be carried out after 1 July 2004, but in no case later than 1 July 2007.

(3) Technical requirements: see Section 12, Chapter 3 of PART THREE of the Rules.

5.3.4.10 Restriction on sailing with any cargo hold being empty

Bulk carriers of 150 m in length and upwards of single side skin construction, designed to carry cargoes having a density of 1.78 t/m^3 and above, where they comply neither with the requirement of SOLAS Reg. XII/5.1 for having sufficient strength to withstand flooding of any one cargo hold nor with resolution MSC.168(79) Standards and Criteria for Side Structures of Bulk Carriers of Single-Side Skin Construction, are not allowed to sail after the date of reaching 10 years of age if any cargo hold is loaded below 10% of the maximum permissible loading of that hold in the full load condition. For the purpose of this paragraph, the full load condition means that the ship is loaded to not less than 90% of its deadweight in relation to the freeboard assigned.

5.3.5 Strength and securing of small hatches on the exposed fore deck and air pipes, ventilator pipes and their closing devices thereover

5.3.5.1 Application

(1) General dry cargo ships (excluding container ships, vehicle carriers, ro-ro ships and woodchip carriers), ore carriers, combination carriers (e.g. oil/bulk/ore carriers, ore/oil carriers) and bulk carriers that are contracted for construction prior to 1 January 2004, of 100 m in length or more.

5.3.5.2 Schedule for compliance:

(1) The requirements of 5.3.5.3 are to be complied with in accordance with the following schedule:

① for ships which are 15 years of age or more on 1 January 2004 by the due date of the first intermediate or special survey after that date;

② for ships which are 10 years of age or more on 1 January 2004 by the due date of the first special survey after that date;

③ for ships which are less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.

Completion prior to 1 January 2004 of an intermediate or special survey with a due date after 1 January 2004 cannot be used to postpone compliance. However, completion prior to 1 January 2004 of an intermediate survey the window for which straddles 1 January 2004 can be accepted.

(2) Ships (on the exposed deck over the forward 0.25*L*, applicable to all ship types of sea-going service of 80 m in length or more, where the height of the exposed deck in way of the hatch is less than 0.1*L* or 22 m above the summer load waterline, whichever is the lesser) that are contracted for construction on or after 1 January 2004 are to comply by the time of delivery.

5.3.5.3 Technical requirements

(1) The strength and securing of the small hatches on the exposed deck giving access to spaces forward of the collision bulkhead (and to spaces which extend over this line aft-wards) is to comply with Section 7, Chapter 1 of PART TWO of the Rules.

(2) Air pipes, ventilator pipes and their closing devices in way of the locations referred to in (1) above are to comply with Section 7, Chapter 1 of PART TWO of the Rules.

5.3.6 Loading instruments

5.3.6.1 Loading instruments for strength calculation

(1) Application:

① Type I ships of 100 m or over in length, as defined in 2.2.8 of Section 2, Chapter 2 of PART TWO of the Rules.

② Bulk carriers (including ore carriers and combination carriers) of 150 m or over in length, as defined in 2.2.8 of Section 2, Chapter 2 of PART TWO of the Rules.

(2) Schedule for compliance:

① Bulk carriers (including ore carriers and combination carriers) of 150 m or over in length and

contracted for construction before 1 July 1998 are to be fitted with loading instruments not later than the date of delivery or 1 January 1999, whichever is later.

② Ships contracted for construction on or after 1 July 1998 are to be fitted with loading instruments before the date of delivery.

(3) Technical requirements: 2.2.8 of Section 2, Chapter 2 and Appendix 1, Chapter 2 of PART TWO of the Rules are to be complied with.

5.3.6.2 Loading instruments for providing intact stability information

(1) Application: All bulk carriers less than 150 m in length and constructed on or after 1 July 2006.

(2) Technical requirements: 1.9.1.3 of Section 9, Chapter 1 of PART TWO of the Rules is to be complied with.

5.3.6.3 Onboard computers for stability calculations

(1) Application: All ships contracted for construction on or after 1 July 2005 and fitted with computers for stability calculations.

(2) Technical requirements: 1.9.1.4 of Section 9, Chapter 1 of PART TWO of the Rules is to be complied with.

5.3.7 Requirements for the fitting of side shell doors, stern doors, bow doors and inner doors of ro-ro passenger ships

5.3.7.1 Side shell doors and stern doors

(1) Application: All existing ro-ro passenger ships with the date of building before 30 June 1996:

① The structural condition of side shell doors and stern doors, especially the primary structure, the securing and supporting arrangements and the hull structure alongside and above the doors, are to be specially examined and any defects rectified.

(2) The following measures are to be complied with by all existing ro-ro passenger ships with the date of building before 30 June 1996:

① The structural arrangement of securing devices and supporting devices of inwards opening doors in way of these securing devices and, where applicable, of the surrounding hull structure is to be reassessed in accordance with the applicable requirements of 9.5.5 of PART TWO of the Rules and modified accordingly.

② The securing and locking arrangements for side shell doors and stern doors which may lead to the flooding of a special category space or ro-ro space as defined in 9.5.1.6 of PART TWO of the Rules, are to comply with the following requirements:

a. separate indicator lights and audible alarms are to be provided on the navigation bridge and on each operating panel to indicate that the doors are closed and that their securing and locking devices are properly positioned;

b. the indication panel is to be provided with a lamp test function. It is not to be possible to turn off the indicator light;

c. the indication panel on the navigation bridge is to be equipped with a mode selection function “harbour/sea voyage”, so arranged that audible alarm is given if the ship leaves harbour with side shell or stern doors not closed or with any of the securing devices not in the correct position;

d. a water leakage detection system with audible alarm and television surveillance is to be arranged to provide an indication to the navigation bridge and to the engine control room of any leakage through the doors.

③ Documented operating procedures for closing and securing side shell and stern doors are to be kept on board and posted at the appropriate places.

5.3.7.2 Bow doors and inner doors

(1) Application: All existing ro-ro passenger ships with the date of building before 30 June 1996. Technical requirements are as follows:

① The structural condition of bow doors and inner doors, especially the primary structure, the securing and supporting arrangements and the hull structure alongside and above the doors, are to be specially examined and any defects rectified.

②Tthe requirements of 9.4.8 of PART TWO of the Rules concerning operating procedures of the bow door and inner door are to be complied with.

(2) The following measures are to be complied with by all existing ro-ro passenger ships with the date of building before 30 June 1996:

① The location and arrangement of inner doors are to comply with 9.4.1.2(4) of PART TWO of the Rules.

② Ships with visor door are to comply with 9.4.6.2(7) of PART TWO of the Rules requiring redundant provision of securing devices preventing the upward opening of the bow door. In addition, where the visor door is not self-closing under external loads (i.e. the closing moment M_y calculated in accordance with 9.4.3.1(3) of PART TWO of the Rules is less than zero) then the opening moment M_o is not to be taken less than $-M_y$. If drainage arrangements in the space between the inner and bow doors are not fitted, the value of M_o is to be specially considered.
Where available space above the tank top does not enable the full application of 9.4.6.2(7) of PART TWO of the Rules, equivalent measures are to be taken to ensure that the door has positive means for being kept closed during seagoing operation.

③ Ships with visor door are to comply with 9.4.6.2(8) of PART TWO of the Rules requiring securing and supporting devices excluding hinges to be capable of bearing the vertical design force ($F_z - 10W$) without exceeding the permissible stresses given in 9.4.2.1 of PART TWO of the Rules.

④ For side-opening doors, the structural arrangements for supporting vertical loads, including securing devices, supporting devices and, where applicable, hull structure above the door, are to be re-assessed in accordance with the applicable requirements of 9.4.6 of PART TWO of the Rules and modified accordingly.

⑤ The securing and locking arrangements for bow doors and inner doors which may lead to the flooding of a special category space or ro-ro space as defined in the 9.4.1.3 of PART TWO of the Rules are to comply with the following requirements:

a. separate indicator lights and audible alarms are to be provided on the navigation bridge and on each operating panel to indicate that the doors are closed and that their securing and locking devices are properly positioned;
b. the indication panel is to be provided with a lamp test function. It is not to be possible to turn off the indicator light;
c. the indication panel on the navigation bridge is to be equipped with a mode selection function "harbour/sea voyage", so arranged that audible alarm is given if the ship leaves harbour with bow doors or inner doors not closed or with any of the securing devices not in the correct position;
d. a water leakage detection system with audible alarm and television surveillance is to be arranged to provide an indication to the navigation bridge and to the engine control room of any leakage through the doors.

5.3.8 Watertightness of chain lockers

(1) Application: Ships of 24 m or over in length, the keels of which are laid or which are at a similar stage of construction on or after 1 July 2003.
(2) Technical requirements: 1.12.10.4 of Section 12, Chapter 1 of PART TWO of the Rules is to be complied with.

5.3.9 Ice class draught mark of ships intended for navigation in ice

5.3.9.1 Marking of warning triangle and ice class draught
(1) Application: Ships having class notations of Ice Class B1* to B3.
(2) Schedule for compliance:

① Ships constructed on or after 1 July 2007, of which the summer load line in fresh water is located at a higher level than the upper ice waterline (UIWL), are to comply with the requirements of this paragraph before the date of delivery.

② Ships constructed before 1 July 2007, of which the summer load line in fresh water is located below the upper ice waterline (UIWL), are to comply with the requirements of this paragraph not later than the first scheduled dry docking after 1 July 2007.

(3) Technical requirements: The ship's sides are to be provided with a warning triangle and with an ice class draught mark at the maximum permissible ice class draught amidships, in accordance with 4.2.1.4 to 4.2.1.8, Section 2, Chapter 4 of PART TWO of the Rules.
5.3.9.2 Documentation and certification requirements regarding ice class draught
(1) Application: Ships having class notations of Ice Class B1* to B3.
(2) Schedule for compliance: The requirements of this paragraph are to be complied with not later than 1 July 2007 or the date of subsequent renewal of the classification certificate.
(3) Technical requirements: 4.2.1 and 4.2.2 of Section 2, Chapter 4 of PART TWO of the Rules.

5.3.10 Requirements for electrical distribution system including harmonic filters

5.3.10.1 Application: for ships contracted for construction before 1 July 2017, the electrical distribution system of which includes harmonic filters. However, harmonic filters installed for single application frequency drives such as pump motors may be excluded from these requirements.

5.3.10.2 Schedule for compliance: for ships to which 5.3.10.1 applies, the due date of the first periodical survey on or after 1 July 2017.

5.3.10.3 Technical requirements: as a minimum, harmonic distortion levels of main busbar on board such existing ships are to be measured annually under seagoing conditions as close to the periodical machinery survey as possible so as to give a clear representation of the condition of the entire plant to the surveyor. Harmonic distortion readings are to be carried out when the greatest amount of distortion is indicated by the measuring equipment. An entry showing which equipment was running and/or filters in service is to be recorded in the log so this can be replicated for the next periodical survey. Harmonic distortion levels are also to be measured following any modification to the ship's electrical distribution system or associated consumers by suitably trained ship's personnel or from a qualified outside source. Records of all the above measurements are to be made available to the surveyor at each periodical survey.

Section 4 HULL AND EQUIPMENT SURVEYS

5.4.1 General requirements

5.4.1.1 Unless expressly provided otherwise, this Section applies to surveys of all ships. In addition, the hull structure, ballast tanks and piping of general dry cargo ships, oil tankers (including double hull oil tankers), bulk carriers (including double skin bulk carriers), chemical tankers and liquefied gas carriers are to meet the relevant requirements of Sections 5, 6, 7, 8 and 16 of this Chapter respectively. Chemical tankers and liquefied gas carriers are also to comply with the relevant requirements of CCS Rules for Construction and Equipment of Ships Carrying Dangerous Liquid Chemicals and Rules for Construction and Equipment of Ships Carrying Liquefied Gases.

5.4.1.2 For additional requirements applicable to water level detectors fitted on single hold cargo ships, refer to the requirements of 5.5.2.6 and 5.5.4.8 of this Chapter.

5.4.1.3 Thickness measurements Acceptance Criteria

(1) The acceptance criteria for thickness measurements are according to relevant provisions of Appendix 1 of this Chapter depending on ship's age and structural elements concerned, e.g 2.4 for corrugated transverse bulkhead, 2.6 or 2.7 for all cargo hatch covers and coamings on exposed decks.

5.4.1.4 Special consideration may be given in application of relevant requirements of this Section to commercial ships owned or chartered by Governments, which are utilized in support of military operations or service.

5.4.2 Annual surveys

5.4.2.1 General requirements for all ships

(1) The annual survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, hatch covers, hatch coamings, closing appliances, equipment and related piping are maintained in a satisfactory condition. The survey intervals are specified in Section 2 of this Chapter.

(2) During an annual survey, a general examination of weather decks, ship side plating above water line, hatch covers and watertight penetrations is to be carried out as far as practicable and their satisfactory condition confirmed.

(3) Annual surveys are to be carried out in conjunction with statutory annual surveys in so far as practicable.

5.4.2.2 Scope of the survey for all ships

(1) Hull

① examining, in general and as far as can be seen, the hull and its closing appliances;

② examining the anchoring (anchors, chain cables, windlass (including its foundation, prime mover and shafting), cable lifters, brakes, chain stoppers, etc. as far as practicable) and mooring equipment as far as can be seen. Confirming that the towing and mooring equipment is properly marked with any restriction associated with its safe operation for ships constructed after 1 January 2007;

③ examining the collision and the other watertight bulkheads and valves operable from above the bulkhead deck as far as can be seen;

④ examining and testing (locally and remotely) all the watertight doors in watertight bulkheads; examining the arrangements for closing openings in the shell plating below the freeboard deck;

⑤ examining each bilge pump and confirming that the bilge pumping system for each watertight compartment is satisfactory;
⑥ confirming that the drainage from enclosed cargo spaces situated on the freeboard deck is satisfactory; examining visually the drainage facilities for blockage or other damage and confirming the provision of means to prevent blockage of drainage arrangements, for closed vehicle and ro-ro spaces and special category spaces where fixed pressure water-spraying systems are used;
⑦ confirming, when appropriate and as far as is practicable when examining internal spaces on oil tankers and bulk carriers, that the means of access to cargo and other spaces remain in good condition;
⑧ examining the functionality of bilge well high water level alarms in all cargo holds and cargo conveyor tunnels;
⑨ inspecting water level detectors and their audible and visual alarms in holds, ballast tanks and dry spaces of bulk carriers;
⑩ checking the arrangements for availability of draining and pumping systems forward of the collision bulkhead of bulk carriers;
⑪ examining the cargo hold water level detector and its audible and visual alarms of single skin single-hold cargo ships;
⑫ confirming that no new installation of materials containing asbestos is on board since last survey.

(2) Load lines ― general requirements
① checking, in general, that the strength of the hull remains in compliance with rules;
② checking of the positions of the deck line and load line which, if necessary, are to be re-marked and re-painted;
③ checking that no alterations have been made to the hull or superstructures that would affect the calculations determining the position of the load lines;
④ examining the superstructure end bulkheads and the openings with their closing appliances therein;
⑤ examining the means of securing the weathertightness of cargo hatchways, other hatchways and other openings on the freeboard and superstructure decks;
⑥ examining the ventilators and air pipes, including their coamings and closing appliances, and in particular, examining the weld connection between air pipes and deck plating as well as external examination of all air pipe heads installed on the exposed decks;
⑦ examining the watertight integrity of the closures to any openings in the ship's side below the freeboard deck;
⑧ examining the scuppers, inlets and discharges;
⑨ examining the side scuttles and deadlights;
⑩ examining the bulwarks including the provision of freeing ports, special attention being given to any freeing ports fitted with shutters;
⑪ examining the guardrails, gangways, walkways and other means provided for the protection of the crew and for gaining access to and from crew's quarters and working spaces;
⑫ examining, when applicable, the means provided to minimize water ingress through the spurling pipes and chain lockers;
⑬ examining, when applicable, the garbage chutes;
⑭ special requirements for ships permitted to sail with type purling pipes and chain lockers;
⑮ checking, when applicable, the fittings and appliances for timber deck cargoes;
⑯ examining portholes, bow doors, stern doors and other similar openings and their closing appliances.

(3) Load lines ― protection of cargo hatches
① checking that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey;
② exposed hatch covers are to be examined to confirm the structural integrity and capability of maintaining weathertightness. Where extensive areas of wastage and/or substantial corrosion of steel hatch covers are found, thickness measurements are to be carried out to confirm the extent of wastage or corrosion, and renewals or repairs made when wastage exceeds allowable margins;
③ where mechanically operated steel covers are fitted, checking the satisfactory condition of:
   a. hatch covers including plating;
   b. hatch coamings including stiffeners;
   c. tightness devices of longitudinal, transverse and intermediate cross junctions (gaskets, gasket

lips, compression bars, drainage channels);
d. clamping devices, retaining bars, cleating;
e. chain or rope pulleys;
f. guides;
g. guide rails and track wheels;
h. stoppers, etc.;
i. wires, chains, gypsies and tensioning devices;
j. hydraulic system essential to closing and securing;
k. safety locks and retaining devices;
l. random checking of stowage and securing of hatch covers in open condition;
m. random checking of proper fit, locking and efficiency of sealing of hatch covers in closed condition;
n. random checking of operational testing of hydraulic and power components, wires, chains, and link drives;

④ where portable covers, wooden or steel pontoons are fitted, checking the satisfactory condition of:
a. wooden covers and portable beams, carriers or sockets for the portable beams, and their securing devices;
b. steel pontoons;
c. tarpaulins;
d. hatch coamings including stiffeners;
e. cleats, battens and wedges;
f. hatch securing bars and their securing devices;
g. loading pads/bars and the side plate edge
h. guide plates and chocks;
i. compression bars, drainage channels and drain pipes (if any).

(4) Stability information and loading manual
① checking the approved stability information, loading manual, damage control plan and damage control manual (if applicable);
② the loading instrument, which is a supplement to the stability information, is to be confirmed in working order by use of the approved check conditions. The user's instruction manual for the loading instrument is to be confirmed on board (if applicable).

(5) Structural fire protection
① confirming that fire control plans are posted and kept as required;
② confirming that no significant changes have been made to the arrangement of structural fire protection;
③ checking integrity and efficiency of all manual and automatic fire doors, if fitted;
④ confirming that the means for escape from the accommodations, machinery spaces and other spaces are satisfactory.

(6) Fire-fighting equipment
① examining the fire pumps, fire mains, hydrants, hoses and nozzles and the international shore connection and checking that each fire pump, including the emergency fire pump, can by operated separately so that two jets of water are produced simultaneously from different hydrants at any part of the ship whilst the required pressure is maintained in the fire main;
② for ships designed to carry containers on or above the weather deck, as applicable, examining the water mist lance, and as appropriate, the mobile water monitors and all necessary hoses, fittings and required fixing hardware;
③ checking the provision and randomly examining the condition of the portable and non-portable fire extinguishers;
④ confirming that the firefighters' outfits including its self-contained compressed air breathing apparatus and emergency escape breathing devices (EEBDs) are complete and in good condition, that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged, and that on board means of recharging breathing apparatus cylinders used during drills or a suitable number of spare cylinders to replace those used are provided, and provision of two-way portable radiotelephone apparatus of an explosion-proof type or intrinsically safe;
⑤ checking the operational readiness and maintenance of fire-fighting systems;
⑥ examining the fixed fire-fighting system for the machinery, cargo, vehicle, special category and ro-ro spaces, as appropriate, and confirming that its means of operation are clearly marked;

⑦ examining the fire extinguishing and special arrangements in the machinery spaces and confirming, as far as practicable and as appropriate, the operation of the remote means of control provided for the opening and closing of the skylights, the release of smoke, the closure of ventilation openings of the space enclosing the funnel, the closure of power-operated and other doors, the stopping of ventilation and boiler space forced and induced draft fans and the stopping of oil fuel and other pumps that discharge flammable liquids;

⑧ checking that fixed carbon dioxide fire-extinguishing systems for the protection of machinery spaces and cargo pump-rooms, where applicable, are provided with two separate controls, one for opening of the gas piping and one for discharging the gas from the storage container, each of them located in a release box clearly identified for the particular space; checking also that the release devices of carbon dioxide fire-extinguishing systems are operated in the required order, i.e. the gas piping is opened before the gas is discharged from the storage container;

⑨ examining, as far as possible, and testing, as feasible, any fire detection and alarm system an sample extraction smoke detection system;

⑩ checking the provision of a fire-extinguishing system for spaces containing paint and/or flammable liquids and deep-fat cooking equipment in accommodation and service spaces;

⑪ examining the helicopter facilities;

⑫ examining the arrangements for oil fuel, lubricating oil and other flammable oils and testing the remote closing of valves for oil fuel, lubricating oil and other flammable oils and the operation of the remote means of closing the valves on the tanks that contain oil fuel, lubricating oil and other flammable oils; examination of flame screens on vents to all bunker tanks;

⑬ examining and testing of the general emergency alarm system;

⑭ examining the fire protection arrangements in cargo, vehicle and ro-ro spaces, including the fire safety arrangements for vehicle carriers carrying motor vehicles with compressed hydrogen or natural gas in their tanks for their own propulsion as cargo, as applicable, and confirming, as far as practicable and as appropriate, the operation of the means for closing the various openings;

⑮ examining and testing the portable gas detectors suitable for the detection of the gas fuel, for vehicle carriers carrying motor vehicles with compressed hydrogen or natural gas in their tanks for their own propulsion as cargo;

⑯ examining, where applicable, the alternative design and arrangements for fire safety and arrangements, in accordance with the test, inspection and maintenance requirements, if any, specified in the approved documentation;

⑰ examining, where appropriate, the special arrangements for carrying dangerous goods, including checking of the electrical equipment and wiring, the ventilation, the provision of protective clothing and portable appliances, and the testing of water supply, bilge pumping and any water spray system.

(7) Suspect areas[①]

① overall examination of suspect areas of the hull, including overall and close-up survey of those suspect areas identified at previous surveys;

② thickness measurements of areas of substantial corrosion identified at previous surveys;

③ where extensive areas of wastage are found or when considered necessary by the Surveyor, thickness measurements are to be carried out and renewals or repairs made when wastage exceeds allowable margins. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for these additional thickness measurements. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

(8) Salt water ballast spaces and/or combined cargo/salt water ballast spaces

Examination of ballast tanks when required as a consequence of the results of the special survey and intermediate survey is to be carried out. Where extensive areas of wastage are found or when considered necessary by the Surveyor, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for these additional measurements. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

---

① These requirements are not applicable to cargo tanks of oil tankers (including double hull oil tankers) and chemical tankers surveyed in accordance with Sections 6 and 8 of this Chapter.

(9) Steering gear

① If applicable, main and auxiliary steering gear, including their associated equipment and control systems, are to be examined and tested and if appropriate, relevant entries in the logbook are to be verified.

(10) Watertight Cable Transits

① The Register is to be reviewed to confirm it is being maintained and as far as practicable the transits are to be examined to confirm their satisfactory condition.

② Where there are records entered since the last annual survey of any disruption to the cable transits or installation of new cable transits, the satisfactory condition of those transits is to be confirmed by review of records and, if deemed necessary, by examination. The results are to be recorded in the Register against the specific cable transit.

③ It is to be confirmed that cable transits have been installed, and where disrupted have been reinstated, in accordance with the manufacturer's requirements and in accordance with the requirements of Type Approval.

④ It is to be confirmed where specified, appropriate specialized tools have been used.

5.4.2.3 For the requirements for additional surveys of ro-ro ships, see Section 17 of this Chapter.

5.4.2.4 Passenger ships (including ro-ro passenger ships)

(1) In addition to the survey items in 5.4.2.2, for passenger ships (including ro-ro passenger ships), the following items are to be carried out:

① all shell plating below bulkhead deck;

② all gangways, cargo ports, inboard openings of ash shoots and rubbish shoots as well as their closing devices below bulkhead deck;

③ side scuttles including watertight steel covers and closing devices below bulkhead deck;

④ all openings including doors and similar openings and their closing devices in watertight bulkheads below bulkhead deck.

5.4.2.5 Non-self-propelled ships

(1) This paragraph applies to surveys of non-self-propelled ships, but not to surveys of floating docks, oil hulks, offshore installations, special equipment and machinery.

(2) Barges

① In addition to the survey items in 5.4.2.2, for barges engaged in transportation of dry bulk cargo over 15 years, the condition of the following structures of hull is to be examined:

a. hold, with special attention given to tank top;

b. structures below main deck;

c. side plating, frames and associated structures.

② The attending Surveyor may require thickness measurements if he deems it necessary, and means are then to be provided for access into not readily accessible areas.

(3) Other non-self-propelled ships

① Survey items in 5.4.2.2, as appropriate.

5.4.2.6 Dredgers

(1) In addition to the survey items in 5.4.2.2, the following additional items are to be carried out for dredgers (if applicable):

① The deck and relevant structural members in the following regions

a. in way of the main gantry and the bucket ladder gantry;

b. in way of cutter ladders and of supporting of the gantry;

c. in way of supporting of the spud;

d. in way of the gantry supporting the suction pipe;

e. in way of the winch seating;

f. in way of the grab machinery;

g. in way of other working regions of machinery;

h. in way of towing bollards;

i. structural members of hopper;

j. opening and closing devices of doors;

k. strake in way of areas where the drag head may run against bilge and side shell of trailing suction dredger.

② Dredging pump room

a. bottom framing of dredging pump room and surrounding structures;

b. watertight trunk;

c. dredging pump seating and surrounding structures.

③ Slots.

④ Rubbing bands.

⑤ Deck hinges.

⑥ Connection of hydraulic gearing.

⑦ Hydraulic gearing and connected pipes.

5.4.2.7 Containerships

(1) In addition to the survey items in 5.4.2.2, the following additional items are to be carried out for containerships (if applicable):

① Documentation

a. cargo securing manual;

b. any renewed securing devices (excluding cell guides) provided with product certificate or certification as required by the Rules and Research Institute.

② Cell guide system

a. guide, cell guide;

b. intersection between cell guide and cross ties;

c. demountable frames;

d. other equivalent restraint arrangements.

③ Fixed securing device

a. corner post;

b. lashing bridge;

c. lashing point.

④ Portable securing device.

(2) For ships assigned class notation of Open-Top Container Ship, the pipelines and nozzles of water spray systems are to be tested with compressed air for unimpeded passage, and pipelines and operating valves externally examined and an appropriate nozzle of the water spray system is to be selected for effectiveness test.

5.4.2.8 Timber carriers

(1) In addition to the survey items in 5.4.2.2, the following additional items are to be carried out for timber carriers (if applicable):

① cargo securing manual;

② arrangements for carrying timbers on the deck;

③ securing devices;

④ safe access.

5.4.2.9 Tugs

(1) In addition to the survey items in 5.4.2.2, the following additional items are to be carried out for tugs (if applicable):

① operations manual;

② towing hook;

③ release mechanism;

④ towing engine;

⑤ supporting structures.

⑥ towing winch emergency release system.

(2) Survey of towing winch emergency release systems, including:

① Operation of the towing winch emergency release system is to be confirmed with the reference to the documented instructions for surveys provided by the manufacturer. Operation of the winch emergency release system under no load condition is to be verified. Where practical, activation of the emergency release system may be confirmed by observation of the winch brake.

② The function of the alarms associated with the emergency release system is to be verified, as far as practicable and reasonable.

③ The condition of the emergency release system is to be visually examined to confirm it remains in satisfactory condition.

④ The means of emergency release of the towline in the event of a blackout is to be examined, and where additional sources of energy are arranged for this purpose, the sources of energy are to be visually inspected and operationally tested.

⑤ It is to be verified that the performance capabilities and operating instructions of the emergency

release system are documented and made available on board the ship on which the winch has been installed.

5.4.2.10 Offshore supply ships

(1) In addition to the survey items in 5.4.2.2, the following additional items are to be carried out for offshore supply ships (if applicable):

① operations manual;

② cargo securing manual;

③ cargo containment arrangement.

5.4.3 Intermediate surveys

5.4.3.1 General requirements

(1) The relevant requirements for interval of intermediate surveys are given in Section 2 of this Chapter.

(2) Intermediate surveys are to be carried out in conjunction with statutory intermediate surveys or docking surveys in so far as practicable. A survey planning meeting is to be held prior to the commencement of the survey.

(3) In addition to cover the applicable items specified in 5.4.2.2 of this Section, intermediate surveys are to include the items specified in 5.4.3.2 and such items are to be found satisfactory.

5.4.3.2 Survey items for all ships

(1) Fire-fighting equipment

① Check of quantity and efficiency of medium of fixed fire-extinguishing arrangements, examination and testing of fire-extinguishing system.

(2) Windlass

① Partial test of slipping and hauling anchors by windlass.

(3) Ballast tanks:

① Ships between 5 and 10 years of age:

A general, internal examination of representative ballast tanks is to be carried out. Where a full hard protective coating in POOR condition or any other defect is found, where soft or semi-hard coating has been applied, or where there is no full hard protective coating, the examination is to be extended to other ballast tanks of the same type.

② Ships over 10 years of age:

A general, internal examination of all ballast tanks is to be carried out.

③ If such examinations as stated in ① and ② above reveal no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains effective.

④ For ballast tanks, excluding double bottom tanks, where a full hard protective coating is found in POOR condition and it is not renewed, where soft or semi-hard coating has been applied, or where there is no full hard protective coating, the tanks in question are to be internally examined at annual intervals.

⑤ When such conditions as stated in ④ above are found in double bottom ballast tanks, the spaces in question may be internally examined at annual intervals.

(4) Cargo spaces

① For ships over 10 years of age, other than ships engaged in the carriage of dry cargoes only and oil tankers (including double hull oil tankers), chemical tankers and liquefied gas carriers complying with relevant provisions of Sections 6, 8 and 16 of this Chapter respectively, an internal examination of selected cargo holds is to be carried out.

② For ships over 15 years of age and engaged in the carriage of dry cargoes only, other than general dry cargo ships and bulk carriers (including double skin bulk carriers) which are subject to the relevant requirements of Sections 5 and 7 of this Chapter respectively, an internal examination of selected cargo spaces is to be carried out.

(5) Thickness measurements

Where extensive areas of wastage are found, thickness measurements are to be required and renewals made when wastage exceeds allowable margins.

5.4.4 Special surveys

5.4.4.1 General requirements

(1) The relevant requirements for interval of special surveys are given in Section 2 of this Chapter.

(2) Special surveys are to be carried out in conjunction with statutory renewal surveys in so far as practicable. A survey planning meeting is to be held prior to the commencement of the survey.

(3) In addition to the applicable items specified in 5.4.2.2 of this Section, special surveys are to include examination, tests and checks of the items listed in 5.4.4.2 to ensure that the hull, equipment and related piping (as required by 5.4.4.2(19)) are in satisfactory condition and that the ship is fit for the intended purpose for the next five (5) year class period, subject to proper maintenance and operation and the periodical surveys being carried out at the due dates. The examinations of the hull are to be supplemented by testing and thickness measurements as required in 5.4.4.2(5) and 5.4.4.2(17)①, ③, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.
(4) Examination of underwater parts specified in Section 11 of this Chapter. However, surveys of the outside of the ship's bottom and related items completed within 15 months before the due date of the special survey may be accepted as a survey carried out at the same time with the special survey.

5.4.4.2 Survey items for all ships

(1) Hull and spaces in superstructures are to be examined.
(2) All spaces including holds and their 'tween decks where fitted; double bottom, deep, ballast, peak and cargo tanks; pump rooms, pipe tunnels, duct keels, machinery spaces, dry spaces, cofferdams and voids are to be internally examined including the plating and framing, bilges and drain wells, sounding, venting, pumping and drainage arrangements. Internal examination of tanks is to be carried out in accordance with Table 5.4.4.2(2). At special survey No.3 and subsequent special surveys, structural downflooding ducts and structural ventilation ducts are to be internally examined.

Internal Examination of Tanks **Table 5.4.4.2(2)**

Tank	Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
Salt water and/or cargo/salt water in turn	All	All	All	All
Fuel oil bunker tanks - Engine room - Cargo length area - If no tanks in cargo length area, additional fuel tank(s) outside of engine room (if fitted)	— — —	— One One	One Two One	One Half, minimum two Two
Lube oil	—	—	—	One
Fresh water	—	One	All	All
Fore and aft peaks (all uses)	All	All	All	All

Notes:
(1) Special attention is to be paid to the striking plate below the sounding pipe and the plating adjacent to the mouth piece when examining.
(2) These requirements apply to tanks of integral (structural) type.
(3) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.
(4) At special survey No.3 and subsequent surveys, one deep tank for fuel oil in the cargo length area is to be included, if fitted.

(3) Where provided, the condition of corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom tanks, where a full hard protective coating is found in POOR condition and it is not renewed, where soft coating or semi-hard has been applied, or where a full hard protective coating was not applied from time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the surveyor.
(4) When such breakdown of full hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a full hard protective coating was not applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.
(5) Boundaries of double-bottom, deep, ballast, peak, and other tanks, including holds adapted for the carriage of salt water ballast, are to be tested with a head of liquid to the top of air pipes or to near the top of hatches for ballast/cargo holds. Boundaries of fuel oil, lube oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions.
Tank testing of fuel oil, lube oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results. The Surveyor may

extend the testing as deemed necessary.
(6) Hydraulic test for some tanks, when found difficult, may be substituted by airtightness test. Where hydraulic test is difficult to be carried out on the shipway or within the dock, it may be carried out while the ship is afloat. Appropriate means of examination before launching such as leakage test are to be carried out for parts that cannot be examined after launching and underwater parts of the hull, or examine tank internal bottom while the ship is afloat.
(7) Where repairs are effected to the shell plating or bulkheads, any tanks in way are to be tested on completion of these repairs.
(8) All decks and superstructures are to be examined.
(9) In cases where the inner surface of the bottom plating is covered with cement, asphalt or other composition, the removal of this covering may be dispensed with, provided that it is inspected, tested by beating and chipping, and found sound and adhering satisfactorily to the steel.
(10) Wood sheathing or other coverings on steel deck are to be examined. If it is found that such wood sheathing has worn by 15 mm or more, or that other coverings are broken, they are to be renewed and the condition of the plating under such wood sheathing or other deck coverings is to be examined.
(11) The hatch covers and coamings are to be surveyed as follows:

① a thorough inspection of the items listed in 5.4.2.2(3), including close-up survey of hatch cover plating and hatch coaming plating, is to be carried out. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey is to be done of accessible parts of hatch covers structures;

② checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:

a. stowage and securing in open condition;
b. proper fit and efficiency of sealing in closed conditions;
c. operational testing of hydraulic and power components, wires, chains and link drives;

③ checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent is to be carried out.

(12) The masts and standing rigging (if fitted) are to be examined.
(13) The anchors and chain cables[①] are to be ranged, examined, and the required complement and condition verified. At special survey No.2 and subsequent special surveys, chain cables are to be gauged. If any length of chain cables is found to be reduced in mean diameter[②] at its most worn part by 12% or more from its nominal diameter as required in the Rules, it is to be renewed. The chain locker, holdfasts, hawse pipes, chain stoppers and windlass are to be examined and pumping arrangements of the chain locker tested.
(14) The anchors of positional mooring equipment are to be cleaned and examined. Wire rope anchor cables are to be examined. If cables are found to contain broken, badly corroded or birdcaging wires they are to be renewed. If any length of chain cables is found to be worn more than as specified under (13) above, it is to be renewed. The windlass(es) or winches are to be examined.
(15) Verifying that repairs made by crew and voyage repairs are in compliance with the Rules, and satisfactory in respect to workmanship, etc. and for the intended purpose of the ship.
(16) Engine room structure is to be examined. Particular attention is to be given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops, and engine room bulkheads in way of tank top and bilge wells. Particular attention is to be given to the sea suctions, seawater cooling pipes and overboard discharge valves[③] and their connections to the shell plating. Where wastage is evident or suspect, thickness measurements are to be carried out, and renewals or repairs made when wastage exceeds allowable limits.
(17) Thickness measurement

① The minimum requirements to thickness measurement are given in Table 5.4.4.2(17)①.

② Thickness measurements may be carried out at the commencement of the special survey, or the thickness measurement report prepared within 15 months before the due date of the special survey may be taken as the thickness measurement report of the special survey.

③ The Surveyor may extend the thickness measurements as deemed necessary. When thickness measurements indicate substantial corrosion, the extent of thickness measurements is to be

---

① For examination of anchors and chain cables, refer to IACS Rec.No.79 “Guidance for Anchoring Equipment in Service”.
② The mean diameter is half the value of the sum of the minimum diameter found in one cross section of the link and of the diameter measured in a perpendicular direction in the same cross section.
③ Refer to IACS Rec.144 “Inspection of ship's side valves”.

increased to determine areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for the additional thickness measurements. These extended thickness measurements are to be carried out before the survey is credited as completed.

④ Thickness measurements are normally to be carried out by a company, certified by CCS according to the Procedures for Certification of Firms Engaged in Thickness Measurement of Hull Structures (Appendix 10 of this Chapter), by means of ultrasonic test equipment The accuracy of the equipment is to be proven to the Surveyor as required. The test personnel are to hold a qualification certificate acceptable to CCS.

⑤ The assessment of thickness measurement results may be based on longitudinal and local strength, or the evaluation of structural safety may be carried out in accordance with CCS rules. For generally allowable corrosion, refer to the provisions in Appendix 1 to this Chapter. Plates and structural members are to be renewed when corrosion exceeds allowable limits.

(18) Automatic air pipe heads are to be completely examined (both externally and internally) as indicated in Table 5.4.4.2(18). For designs where the inner parts cannot be properly inspected from outside, this is to include removal of the head from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

(19) All bilge and ballast piping systems are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

(20) Inspection of Watertight Cable Transits

① The requirements for Special Survey may be undertaken by the attending Surveyor or by a firm approved as a service supplier according to Appendix 8 of this chapter.

② All transits are to be examined to confirm their satisfactory condition and the Register is to be reviewed to confirm it is being maintained. The Special Survey is to be recorded in the Register, in which a single record entry will be sufficient to record the survey of all transits.

③ From review of the Register, where there are records entered since the last special survey of any disruption to the cable transits or installation of new cable transits (except which are reviewed and examined at previous annual surveys), the satisfactory condition of those transits is to be confirmed by the attending Surveyor by review of records and examination of the transits; the results are to be recorded in the Register against each of those cable transits.

④ In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

Minimum Requirements for Thickness Measurements at Special Surveys Table 5.4.4.2(17)①

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
(1) Suspect areas throughout the ship	(1) Suspect areas throughout the ship	(1) Suspect areas throughout the ship	(1) Suspect areas throughout the ship
	(2) One transverse section of deck plating within the amidships 0.5*L* (in way of a cargo space, if applicable)	(2) Two transverse sections within the amidships 0.5*L* (in way of two cargo spaces, if applicable)	(2) A minimum of three transverse sections within the amidships 0.5*L* (in way of a cargo space, if applicable)
		(3) All cargo hold hatch covers and coamings (plating and stiffeners)	(3) All cargo hold hatch covers and coamings (plating and stiffeners)
		(4) Internals in forepeak and afterpeak ballast tanks	(4) Internals in forepeak and afterpeak ballast tanks
			(5) All exposed main deck plating full length
			(6) Representative exposed superstructure deck plating (poop, bridge, and forecastle deck)
			(7) Lowest strake and strakes in way of 'tween decks of all transverse bulkheads in cargo spaces together with internals in way
			(8) All wind- and water strakes, port and starboard, full length
			(9) All keel plates full length. Also,

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
			additional bottom plates in way of cofferdams, machinery space, and aft end of tanks
			(10) Plating of sea chests. Shell plating in way of overboard discharges as considered necessary by the attending Surveyor

Notes: For thickness measurements reporting, the forms included in Appendix 13.1A of this Chapter may be used, as appropriate. The annexed forms are a recommendation and are not a mandatory requirement.

1. Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.
2. Thickness measurements of internals may be specially considered by the Surveyor if the hard protective coating is in GOOD condition.
3. For ships less than 100 m in length, the number of transverse sections required at special survey No.3 may be reduced to one (1), and the number of transverse sections required at subsequent special surveys may be reduced to two (2).
4. For ships more than 100 m in length, at special survey No.3, thickness measurements of exposed deck plating within amidships 0.5*L* may be required.
5. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, thickness measurement is to be done of accessible parts of hatch covers structures.

Guidance for Additional Thickness Measurements in Way of Substantial Corrosion

Table 5.4.4.2(17)②

Structural member	Extent of measurement	Pattern of measurement
Plating	Suspect area and adjacent plates	5-point pattern over 1 square meter
Stiffeners	Suspect area	3 measurements each in line across web and flange

Survey Requirements for Automatic Air Pipe Heads at Special Surveys

Table 5.4.4.2(18)

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Surveys No.3 and Subsequent Age > 10
(1) Two air pipe heads, one port and one starboard, located on the exposed decks in the forward 0.25*L*, preferably air pipes serving ballast tanks. (2) Two air pipe heads, one port and one starboard, on the exposed decks, serving spaces aft of 0.25*L*, preferably air pipes serving ballast tanks. (3) The selection of air pipe heads to be examined is left to the attending Surveyor. (4) According to the results of this examination, the Surveyor may require the examination of other heads located on the exposed decks	(1) All air pipe heads located on the exposed decks in the forward 0.25*L*. (2) At least 20% of air pipe heads on the exposed decks serving spaces aft of 0.25*L*, preferably air pipes serving ballast tanks. (3) The selection of air pipe heads to be examined is left to the attending Surveyor. (4) According to the results of this examination, the Surveyor may require the examination of other heads located on the exposed decks	All air pipe heads located on the exposed decks. Exemption may be considered for air pipe heads where there is substantiated evidence of replacement within the previous five years

5.4.4.3 Non-self-propelled ships

(1) In addition to the survey items in 5.4.4.2, the following items are to be examined and tested:

① waterhead test of tanks may be substituted with airtightness test;

② all pumps and pipes are to be generally examined and tested under working conditions;

③ all sea chests are to be opened up and examination;

④ for tankers carrying cargoes having a flashpoint not exceeding 60℃and having electrical installations in dangerous zones, the electrical installations are to be examined and tested in accordance with the provisions for self-propelled tankers;

⑤ pumps or prime movers on board are in general not required to be opened up for examination, unless deemed necessary as a consequence of the results of the examination or test.

5.4.4.4 Tugs

(1) In addition to the applicable survey items in 5.4.4.2, the additional survey of towing winch emergency release systems is to be carried out for tugs, including:

① The Annual Survey requirements in item 5.4.2.9(2) are to be carried out, with the additional instructions for special survey provided by the manufacturer, as appropriate, being followed.

② The full functionality of the emergency release system is to be tested to the satisfaction of the surveyor. Testing may be conducted either during a bollard pull test or by applying the load against a strong point on the deck of the tug or the shore that is certified to the appropriate load.

③ The emergency release system is to be tested at a towline load that is equal to the lesser of 30% of the maximum design load or 80% of vessel bollard pull in both a normal power condition and power blackout condition to the satisfaction of the surveyor.

Section 5 ADDITIONAL REQUIREMENTS FOR HULL AND EQUIPMENT SURVEYS OF GENERAL DRY CARGO SHIPS①

5.5.1 General requirements

5.5.1.1 Application

(1) Unless provided otherwise, the requirements of this Section apply to all self-propelled general dry cargo ships of 500 gt and above carrying solid cargoes other than②:

① bulk carriers (including double skin bulk carriers);

② dedicated container carriers;

③ ro-ro cargo ships;

④ refrigerated cargo ships;

⑤ dedicated woodchip carriers;

⑥ dedicated cement carriers;

⑦ livestock carriers;

⑧ deck cargo ships③;

⑨ general dry cargo ships of double side-skin construction, with double side-skin extending for the length of the cargo area, and for the height of the cargo hold to the upper deck④.

(2) For General Dry Cargo Ships with hybrid cargo hold arrangements, e.g. with some cargo holds of single-side skin and others of double-side skin, the requirements of this Section are to be applied only to structure in way of the single-side skin cargo hold region.

(3) The requirements of this Section apply to surveys of hull structure and piping systems in way of cargo holds, cofferdams, pipe tunnels, void spaces and fuel oil tanks within the cargo area and all ballast tanks. The requirements are additional to the classification requirements applicable to the remainder of the ship. Refer to Section 4 of this Chapter.

(4) The requirements of this Section contain the minimum extent of examination, thickness measurements and tank testing. The survey is to be extended when substantial corrosion and/or structural defects are found and include additional close-up survey when necessary.

5.5.1.2 Thickness measurements Acceptance Criteria

(1) The acceptance criteria for thickness measurements are according to the relevant requirements of Appendix 1 of this Chapter depending on ship's age and structural elements concerned, e.g. 2.4⑤ for corrugated transverse bulkhead, 2.6⑥ or 2.7 for all cargo hatch covers and coamings on exposed decks.

5.5.2 Annual surveys

---

① For surveys, assessment and repair of hull structure, refer to IACS Rec.55 "General Dry Cargo Ships - Guidelines for Surveys, Assessment and Repair of Hull Structure".

② The requirements of paragraphs 5.5.2.6 and 5.5.4.8 also apply to those cargo ships, which, although belonging to the ship types that are excluded from the application of this Section, are fitted with a single cargo hold.

③ A ship that is designed to carry cargo exclusively above deck has no any access for cargo below deck.

④ Special consideration may also be given to ships that are of double side-skin construction but with single skin in way of several frame spaces e.g. in way of a cargo hold entrance or in way of forebody hull form at the forward end of the foremost cargo hold.

⑤ 2006 edition of the Rules or subsequent revisions or corrigenda as applicable.

⑥ For ships contracted for construction on or after 1 July 2012, see 2.20.2.10, Section 20, Chapter 2, PART TWO of 2012 edition of the Rules. For ships contracted for construction on or after 1 July 2016, see 2.20.2.10, Section 20, Chapter 2, PART TWO of 2016 Amendments of the Rules.

5.5.2.1 General requirements

(1) The annual survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition.

(2) The annual survey is to include the items specified in 5.5.2.2 through 5.5.2.6 and in addition, the applicable items specified in 5.4.2 of this Chapter.

5.5.2.2 Hull

(1) Examination of the hull plating and its closing appliances as far as can be seen;

(2) Examination of watertight penetrations as far as practicable.

5.5.2.3 Weather decks, hatch covers and coamings

(1) Confirmation is to be obtained that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey.

(2) Where mechanically operated steel covers are fitted, checking the satisfactory condition of:

① hatch covers, including close-up survey of hatch cover plating;

② drainage channels, drain pipes and non-return devices on top of hatch coamings;

③ tightness devices of longitudinal, transverse and intermediate cross junctions (gaskets, gasket lips, compression bars, drainage channels);

④ clamping devices, retaining bars, cleating;

⑤ chain or rope pulleys;

⑥ guides;

⑦ guide rails and track wheels;

⑧ stoppers, etc.;

⑨ wires, chains, gypsies, tensioning devices;

⑩ hydraulic system essential to closing and securing;

⑪ safety locks and retaining devices.

(3) Where portable covers, wooden or steel pontoons are fitted, checking the satisfactory condition where applicable of:

① wooden covers and portable beams, carriers or sockets for the portable beam, and their securing devices;

② steel pontoons; including close-up survey of hatch cover plating;

③ tarpaulins;

④ cleats, battens and wedges;

⑤ hatch securing bars and their securing devices;

⑥ loading pads/bars and the side plate edge;

⑦ guide plates and chocks;

⑧ compression bars, drainage channels and drain pipes (if any).

(4) Checking the satisfactory condition of hatch coaming plating and their stiffeners including close-up survey.

(5) Random checking of the satisfactory operation of mechanically operated hatch covers is to be made including:

① stowage and securing in open condition;

② proper fit and efficiency of sealing in closed condition;

③ operational testing of hydraulic and power components, wires, chains, and link drives.

5.5.2.4 Suspect Areas

Suspect areas identified at previous surveys are to be examined. Thickness measurements are to be taken of the areas of substantial corrosion and the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for the additional thickness measurements. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

5.5.2.5 Examination of cargo holds

(1) Ships 10 to 15 years of age

① Overall survey of one forward and one after cargo hold and their associated 'tween-deck spaces.

② When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for these additional measurements. These extended thickness measurements are to be carried out

before the annual survey is credited as completed.

(2) Ships over 15 years of age

① Overall survey of all cargo holds and 'tween-deck spaces.

② Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in a forward lower cargo hold and one other selected lower cargo hold. Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of those cargo holds and associated 'tween-deck spaces (as applicable) as well as a close-up survey of sufficient extent of all remaining cargo holds and 'tween-deck spaces (as applicable).

③ When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for these additional measurements. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

④ Where the protective coating in cargo holds, as applicable, is found to be in GOOD condition, the extent of close-up surveys may be specially considered.

⑤ All piping and penetrations in cargo holds, including overboard piping, are to be examined.

5.5.2.6 For single hold cargo ships complying with the requirements of SOLAS Reg. II-I/25 for hold water level detectors, the annual survey is to include an examination and a test, at random, of the water ingress detection system and of their alarms.

5.5.3 Intermediate surveys

5.5.3.1 General requirements

(1) The intermediate survey extent is dependent on the age of the ship as specified in 5.5.3.2 to 5.5.3.4 of this Section.

(2) The intermediate survey is also to include the applicable items specified in 5.4.3 of this Chapter and 5.5.2 of this Section.

5.5.3.2 Ships 5 to 10 years of age

(1) Ballast tanks

① For ballast tanks, an overall survey of representative tanks selected by the Surveyor is to be carried out. If such overall survey reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains efficient.

② Where POOR coating condition, soft or semi-hard coating, corrosion or other defects are found in ballast tanks or where a full hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.

③ In ballast tanks other than double bottom tanks, where a full hard protective coating is found in POOR condition and it is not renewed, where soft or semi-hard coating has been applied, or where a full hard protective coating was not applied from time of construction, the tanks in question are to be examined and thickness measurements carried out as considered necessary at annual intervals. When such breakdown of full hard protective coating is found in double bottom ballast tanks, where a soft or semi-hard coating has been applied, or where a full hard protective coating has not been applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

④ In addition to the requirements above, areas found suspect at previous surveys are to be surveyed in accordance with the provisions indicated in 5.5.2.4 of this Chapter.

(2) Cargo holds

① An overall survey of one forward and one after cargo hold and their associated 'tween-deck spaces.

② Areas found suspect at previous surveys are to be surveyed in accordance with the provisions indicated in 5.5.2.4.

5.5.3.3 Ships 10 to 15 years of age

(1) Ballast tanks

① For ballast tanks, an overall survey of all tanks is to be carried out. If such overall survey reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains efficient.

② The requirements of 5.5.3.2(1)③ and ④ also apply.

(2) Cargo holds

① An overall survey of all cargo holds and 'tween-deck spaces.

② Areas found suspect at previous surveys are to be surveyed in accordance with the provisions indicated in 5.5.2.4 of this Chapter.

③ When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for these additional measurements. These extended thickness measurements are to be carried out before the survey is credited as completed.

5.5.3.4 Ships over 15 years of age:

(1) The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 5.5.4, except for item 2c in column 4 of Table 5.5.4.5(1). However, tank testing specified in 5.5.4.6, survey of automatic air pipe heads (see 5.4.4.2(18)) and internal examination of fuel oil, lube oil and fresh water tanks (see 5.5.4.4(1)) are not required unless deemed necessary by the attending Surveyor.

(2) In application of (1), the intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey in lieu of the application of 5.2.4.2 of this Chapter.

(3) In lieu of the requirements of 5.5.4.1(5), an in-water survey, according to the provisions of 5.2.3.4 of this Chapter, may be considered as equivalent.

5.5.4 Special surveys

5.5.4.1 General requirements

(1) The special survey is to include, in addition to the requirements of 5.4.4 of this Chapter and 5.5.2 of this Section, examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in 5.5.4.1(3), are in a satisfactory condition and fit for the intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

(2) All cargo holds, ballast tanks, including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined, and if necessary, this examination is to be supplemented by thickness measurement and testing as required in 5.5.4.5 and 5.5.4.6, to ensure that the structural integrity remains effective.

The internal examination of other tanks is to be in accordance with 5.4.4.2(2) of this Chapter. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

(3) All piping systems within the above spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

(4) The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.

(5) A survey in dry dock is to be a part of the special survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions[①] of the cargo holds and ballast tanks are to be carried out in accordance with the applicable requirements for special surveys, if not already performed.

5.5.4.2 Tank protection

(1) Where provided, the condition of corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom tanks, where a full hard protective coating is found in POOR condition and it is not renewed, where soft or semi-hard coating has been applied, or where a full hard protective coating was not applied from the time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the Surveyor.

(2) When such breakdown of full hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a full hard protective coating was not applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

(3) Where the hard protective coating in tanks is found to be in a GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

---

① Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.

5.5.4.3 Hatch covers and coamings

(1) A thorough inspection of the items listed in 5.5.2.3 of this Section is to be carried out.

(2) Checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:

① stowage and securing in open condition;

② proper fit and efficiency of sealing in closed conditions;

③ operational testing of hydraulic and power components, wires, chains and link drives.

(3) Checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent is to be carried out.

(4) Close-up survey and thickness measurement① of the hatch cover and coaming plating and stiffeners is to be carried out as given in Table 5.5.4.4(2) and Table 5.5.4.5(1).

5.5.4.4 Extent of overall and close-up survey

(1) An overall survey of all tanks and spaces, excluding fuel oil, lube oil and fresh water tanks, is to be carried out at each special survey. (Note: For fuel oil, lube oil and fresh water tanks, reference is to be made to Table 5.4.4.2(2).)

(2) The minimum requirements for close-up surveys at special survey are given in Table 5.5.4.4(2).

(3) The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

(4) For areas in spaces where hard protective coatings are found to be in a GOOD condition, the extent of close-up surveys according to Table 5.5.4.4(2) may be specially considered.

---

① Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/thickness measurement shall be done of accessible parts of hatch covers structures.

Minimum Requirements for Close-up Surveys at Hull Special Surveys of General Dry Cargo Ships

Table 5.5.4.4(2)

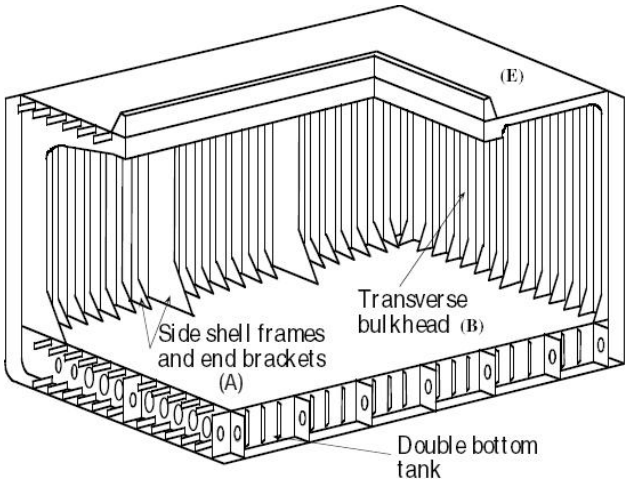
Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
(A) Selected shell frames in one forward and one aft cargo hold and associated 'tween-deck spaces. (B) One selected cargo hold transverse bulkhead. (D) All cargo hold hatch covers and coamings (plating and stiffeners)	(A) Selected shell frames in all cargo holds and 'tween-deck spaces. (B) One transverse bulkhead in each cargo hold. (B) Forward and aft transverse bulkhead in one side ballast tank, including stiffening system. (C) One transverse web with associated plating and framing in two representative water ballast tanks of each type (i.e. topside, hopper side, side tank or double bottom tank) (D) All cargo hold hatch covers and coamings (plating and stiffeners). (E) Selected areas of all deck plating and underdeck structure inside line of hatch openings between cargo hold hatches. (F) Selected areas of inner bottom plating	(A) All shell frames in the forward lower cargo hold and 25% frames in each of the remaining cargo holds and 'tween-deck spaces including upper and lower end attachments and adjacent shell plating. (B) All cargo hold transverse bulkheads. (B) All transverse bulkheads in ballast tanks, including stiffening system. (C) All transverse webs with associated plating and framing in each ballast tank. (D) All cargo hold hatch covers and coamings (plating and stiffeners). (E) All deck plating and underdeck structure inside line of hatch openings between cargo hold hatches. (F) All areas of inner bottom plating	(A) All shell frames in all cargo holds and 'tween-deck spaces including upper and lower end attachments and adjacent shell plating. Areas (B) – (F) as for Special Survey No.3

Notes: (A) Cargo hold transverse frames.
(B) Cargo hold transverse bulkhead plating, stiffeners and girders.
(C) Transverse web frame or watertight transverse bulkhead in water ballast tanks.
(D) Cargo hold hatch covers and coamings. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/thickness measurement is to be done of accessible parts of hatch covers structures.
(E) Deck plating and underdeck structure inside line of hatch openings between cargo hold hatches.
(F) Inner bottom plating.

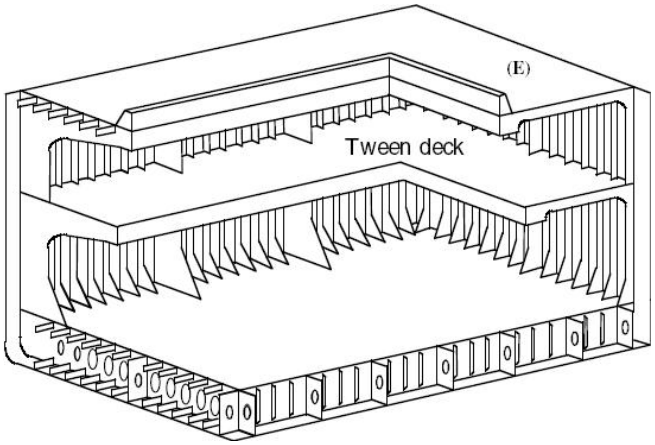
See Figures 5.5.4.4(2)a and 5.5.4.4(2)b for the areas corresponding to (A), (B), (C), (D), (E) and (F).

Close-up survey of cargo hold transverse bulkheads to be carried out at the following levels:

a. Immediately above the inner bottom and immediately above the 'tween decks, as applicable.
b. Mid-height of the bulkheads for holds without 'tween decks.
c. Immediately below the main deck plating and 'tween deck plating.

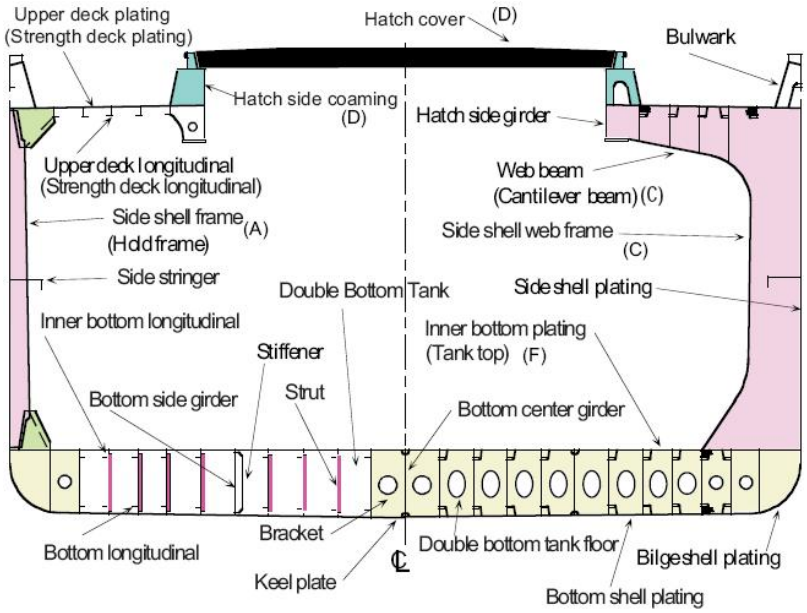


(a) Single deck ship



(b) Tween deck ship

Figure 5.5.4.4(2)a Areas for Close-Up Survey of General Dry Cargo Ships



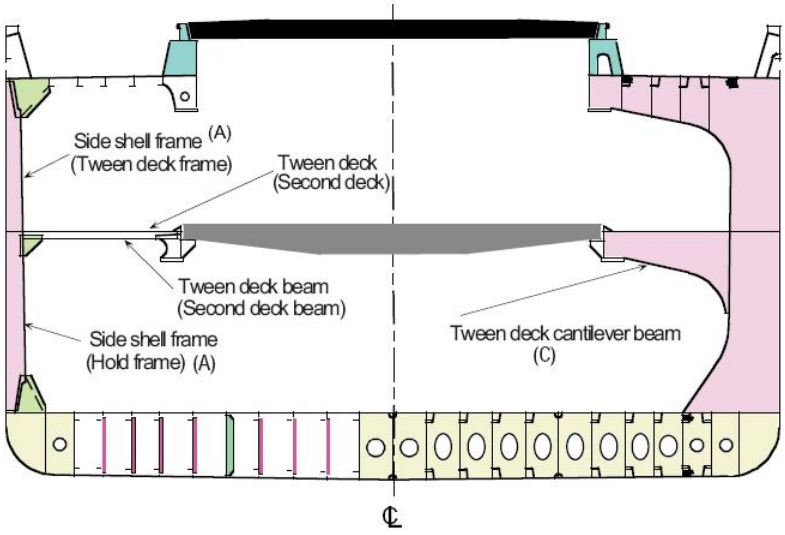


Figure 5.5.4.4(2)b Areas for Close-Up Survey of General Dry Cargo Ships

5.5.4.5 Extent of thickness measurement

(1) The minimum requirements for thickness measurements at special survey are given in Table 5.5.4.5(1).

Minimum Requirements for Thickness Measurements at Hull Special Surveys of General Dry Cargo Ships **Table 5.5.4.5(1)**

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
1. Suspect areas	1. Suspect areas. 2. One transverse section of deck plating in way of a cargo space within the amidships 0.5*L*. 3. Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table 5.5.4.4(2) of this Section	1. Suspect areas. 2. Two transverse sections within the amidships 0.5*L* in way of two different cargo spaces. 3. Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table 5.5.4.4(2) of this Section. 4. Within the cargo length, each deck plate outside line of cargo hatch openings. 5. All wind and water strakes within the cargo length area. 6. Selected wind and water strakes outside the cargo length area	1. Suspect areas. 2. Within the cargo length: a) A minimum of three transverse sections within the amidships 0.5*L*. b) Each deck plate outside line of cargo hatch openings. c) Each bottom plate, including lower turn of bilge. d) Duct keel or pipe tunnel plating and internals. 3. Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table 5.5.4.4(2) of this Section 4. All wind and water strakes full length

Notes: 1. Thickness measurement locations should be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.

2. For ships less than 100 m in length, the number of transverse sections required at special survey No.3 may be reduced to one and the number of transverse sections at special survey No.4 and subsequent surveys may be reduced to two.

(2) The Surveyor may extend the thickness measurements as deemed necessary. When thickness measurements indicate substantial corrosion, the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for these additional thickness measurements.

(3) For areas in spaces where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurement according to Table 5.5.4.5(1) may be specially considered.

(4) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

(5) For the assessment of thickness measurement results, see 5.4.4.2(17)⑤ of this Chapter.

5.5.4.6 Extent of tank testing
(1) All boundaries of ballast tanks and deep tanks used for water ballast within the cargo length area are to be pressure tested. For fuel oil tanks, the representative tanks are to be pressure tested.
(2) The Surveyor may extend the tank testing as deemed necessary.
(3) Tank testing of fuel oil tanks is to be carried out with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil tanks may be specially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results.
5.5.4.7 Automatic air pipe heads
(1) For examination of automatic air pipe heads installed on the exposed decks, reference is to be made to 5.4.4.2(18) of this Chapter.
5.5.4.8 For single hold cargo ships complying with the requirements of SOLAS Reg. II-I/25 for hold water level detectors, the special survey is to include an examination and a test of the water ingress detection system and their alarms.

Section 6 ADDITIONAL REQUIREMENTS FOR HULL AND EQUIPMENT SURVEYS OF OIL TANKERS

5.6.1 General requirements

5.6.1.1 Application
(1) This Section applies to surveys of hull and equipment for all single or double hull oil tankers, including oil/ore carriers and oil/bulk/ore carriers.
(2) This Section applies to surveys of hull structure and piping systems in way of cargo tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks. The requirements of this Section are additional to the classification requirements applicable to the remainder of the ship.
(3) This Section contains the minimum extent of examination, thickness measurements and tank testing. The survey is to be extended when substantial corrosion and/or structural defects are found and include additional close-up survey when necessary.
(4) Except as stated otherwise, this Section applies to single or double hull oil tankers (including those oil tankers of which the distance between inner hull and outer hull is not in compliance with Regulation 13F of Annex I to MARPOL) having one of the following type notations:
- Oil Tanker;
- Oil Tanker, Double Hull (double hull oil tankers complying with Chapter 5, PART TWO of the Rules).

5.6.1.2 Special tankers
(1) For certain special tankers, CCS may accept the provisions of special guidelines for survey.
5.6.1.3 Evaluation of longitudinal strength
(1) In case of oil tankers of 130 m in length and upwards (as defined in the International Convention on Load Lines in force), the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured (see 5.6.4.4(6)), renewed or reinforced, as appropriate, during the special survey after the ship reaches 10 years of age in accordance with Appendix 2 of this Chapter, Criteria for Longitudinal Strength of Hull Girder for Oil Tankers.
(2) The final result of evaluation of the ship's longitudinal strength required in (1) above, after renewal or reinforcement work of structural members, if carried out as a result of initial evaluation, is to be reported as a part of the Executive Hull Summary.

5.6.2 Annual surveys

5.6.2.1 General requirements
(1) The annual survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition and should take into account the service history, condition and extent of the corrosion prevention system of ballast tanks and areas identified in the survey report file.
(2) The annual survey is to include the items specified in 5.6.2.2 through 5.6.2.6 and in addition, the applicable items specified in 5.4.2 of this Chapter.
5.6.2.2 Hull
(1) Examination of the hull plating and its closing appliances as far as can be seen.
(2) Examination of watertight penetrations as far as practicable.

5.6.2.3 Weather decks
(1) Examination of cargo tank openings including gaskets, covers, coamings and flame screens.
(2) Examination of cargo tank pressure/vacuum valves and flame screens.
(3) Examination of flame screens on vents to all bunker, oily ballast, oily slop tanks and void spaces.
(4) Examination of cargo, crude oil washing, ballast and stripping systems both on deck and in cargo pump rooms, and bunker and vent piping systems on deck including vent masts and headers.
(5) Examination of cargo tank venting, purging, gas-freeing and other ventilation systems.
5.6.2.4 Cargo pump rooms and pipe tunnels if fitted
(1) Confirming that potential sources of ignition such as loose gear, combustible materials, etc., in or near the cargo pump room are eliminated, that there are no signs of undue leakage and that access ladders are in good condition.
(2) Examination of all pump room bulkheads for signs of leakage or fractures, and in particular, the sealing arrangements of all penetrations in these bulkheads.
(3) Examination of the condition of all piping systems in the cargo pump room so far as practicable.
(4) Confirming that installed pressure gauges on cargo discharge lines and level indicator systems are operational.
(5) Examination, so far as practicable, of cargo, bilge, ballast and stripping pumps in the cargo pump room for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and operation of pump room bilge system, and checking that pump foundations are intact.
(6) Confirming that the pump room ventilation system is operational, ducting intact, dampers operational and screens are clean.
(7) Confirming that temperature sensing devices for bulkhead glands and audible and visible alarms in pump rooms are in good condition, if applicable.
(8) Confirming that bilge level monitoring devices and alarms in pump rooms are in good condition (if applicable).
(9) Examination of the fixed fire-fighting system for cargo pump rooms, and confirming, as far as practicable and when appropriate, the operation of the remote means for closing the various openings.
(10) Checking interlock between lighting and ventilation.
(11) Checking gas detection system.
5.6.2.5 Other equipment
(1) Checking the deck foam system, including the supplies of foam concentrate and testing that the minimum number of jets of water at the required pressure in the fire main is obtained, when the system is in operation.
(2) Examination of emergency towing arrangements at both ends of tankers of not less than 20,000 tonnes deadweight and verification that they are in good working condition, in so far as practicable.
(3) Examination of safe access to bow.
(4) Examination of instrumentation for continuously monitoring concentration of hydrocarbon gas, if applicable.
(5) Confirming, when appropriate, that the main steering gear comprises the necessary two or more identical power units and the requisite arrangements to regain steering capability in the event of a single failure.
(6) Examination of level indicator systems, all electrical equipment in dangerous zones, piping and stopping valves of cargo tanks.
(7) Confirming that a corrosion prevention system is fitted in dedicated ballast water tanks of oil tankers; Confirming that the coating system in cargo oil tanks of crude oil tankers, when appropriate, is maintained and that in-service maintenance and repair activities are recorded in the coating technical file.
(8) Examining the emergency lighting in all cargo pump rooms of oil tankers constructed after 1 July 2002.
(9) checking, for all tankers, the provision of at least two portable instruments for measuring oxygen and two for measuring flammable vapour concentrations, and suitable means for the calibration of these instruments.
(10) examining the arrangements for gas measurement in double-hull spaces and double bottom spaces, including the fitting of permanent gas sampling lines, where appropriate.
(11) examining, as far as possible, and testing the fixed hydrocarbon gas detection system.
(12) testing any fire detection and alarm system and any sample extraction smoke detection system.
5.6.2.6 Ballast tanks
(1) Examination of ballast tanks where required as a consequence of the results of the special survey (see 5.6.4) and intermediate survey (see 5.6.3.2(1) and (2)) is to be carried out. When considered necessary by the Surveyor, or when extensive corrosion exists, thickness measurements are to be carried out and if the

results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tables 5.6.4.4(2)①a to d and 5.6.4.4(2)②a to e respectively for oil tankers and double hull oil tankers. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken. For CSR ships, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out.

5.6.2.7 Examining, for oil tankers of 150 m in length and above, where appropriate, the ship's structure in accordance with the Ship Construction File, taking into account identified areas that need special attention, and verifying that the Ship Construction File is updated, where applicable[①].

5.6.3 Intermediate surveys

5.6.3.1 General requirements

(1) The intermediate survey extent is dependent on the age of the ship as specified in 5.6.3.2 to 5.6.3.4 and Table 5.6.3 of this Section.

Minimum Requirements for Overall and Close-Up Survey and Thickness Measurements at Intermediate Survey of Double Hull Oil Tankers **Table 5.6.3**

Age of ship at time of intermediate survey due date		
5 < age ≤ 10	10 < age ≤ 15	age > 15
Overall survey of Representative ballast tanks selected by the attending surveyor (see 5.6.3.2)	The requirements of the previous Special Survey (see 5.6.3.3)	The requirements of the previous Special Survey (see 5.6.3.4)
Suspect areas identified at previous surveys are to be examined (see 5.6.3.2)		

(2) The intermediate survey is also to include the applicable items specified in 5.4.3 of this Chapter and 5.6.2 of this Section.

(3) For weather decks, an examination as far as applicable of cargo, crude oil washing, bunker, ballast, steam and vent piping systems as well as vent masts and headers is to be carried out. If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, thickness measured or both; particular attention is to be paid to repairs such as welded doublers.

(4) For CSR ships, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out.

5.6.3.2 Oil Tankers 5 to 10 years of age

(1) All ballast tanks are to be examined. When considered necessary by the Surveyor, thickness measurement and testing are to be carried out to ensure that the structural integrity remains effective. In the case of double hull oil tankers, for tanks used for salt water ballast, an overall survey of representative tanks selected by the Surveyor is to be carried out. If such inspections reveal no visible structural defects, the examination may be limited to a verification that the hard protective coating remains in GOOD condition.

(2) A ballast tank is to be examined at subsequent annual intervals where:

① a hard protective coating has not been applied from the time of construction, or

② a soft or semi-hard coating has been applied, or

③ substantial corrosion is found within the tank, or

④ the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

(3) In addition to the above, suspect areas identified at previous surveys are to be examined.

5.6.3.3 Oil Tankers 10 to 15 years of age

(1) The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 5.6.4 and 5.1.6.5. However, pressure testing of cargo and ballast tanks and the requirements for longitudinal strength evaluation of hull girders as required in 5.6.1.3 are not required unless deemed necessary by the attending Surveyor.

(2) In application of (1) above, the intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey.

(3) In application of (1) above, an underwater survey may be considered in lieu of the requirements of 5.6.4.1(4).

---

① Refer to Annex B to the International Code on the Enhanced Programme of Inspections during Surveys of Bulk Carriers and Oil Tankers, 2011(Resolution A.1049(27)),as amended.

5.6.3.4 Oil tankers over 15 years of age

(1) The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 5.6.4 and 5.1.6.5. However, pressure testing of cargo and ballast tanks and the requirements for longitudinal strength evaluation of hull girders as required in 5.6.1.3 are not required unless deemed necessary by the attending Surveyor.

(2) In application of (1) above, the intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey.

(3) In application of (1) above, a survey in dry dock is to be part of the intermediate survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions[①] of the cargo tanks and ballast tanks are to be carried out in accordance with the applicable requirements for intermediate surveys, if not already performed.

5.6.4 Special surveys

5.6.4.1 General requirements

(1) The special survey is to include, in addition to the applicable requirements of 5.4.4 of this Chapter and 5.6.2 of this Section, examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in 5.6.4.1(3), is in a satisfactory condition and is fit for its intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

(2) All cargo tanks, ballast tanks, including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing required in 5.6.4.4 and 5.6.4.5, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

(3) Cargo piping on deck, including crude oil washing (COW) piping, cargo and ballast piping within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are open during repair periods and can be examined internally.

(4) A survey in dry dock is to be a part of the special survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions[①] of the cargo tanks and ballast tanks are to be carried out in accordance with the applicable requirements for special surveys, if not already performed.

5.6.4.2 Tank protection

(1) Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined.

(2) A ballast tank is to be examined at subsequent annual intervals where:

① a hard protective coating has not been applied from the time of construction, or

② a soft or semi-hard coating has been applied, or

③ substantial corrosion is found within the tank, or

④ the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

Thickness measurements are to be carried out as deemed necessary by the Surveyor.

5.6.4.3 Extent of overall and close-up surveys

(1) An overall survey of all tanks and spaces is to be carried out at each special survey.

(2) The minimum requirements for close-up surveys at special survey are given as follows, for ships not having the notation ESP, the Surveyor may carry out the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system.

① The minimum requirements for close-up surveys of oil tankers are given in Table 5.6.4.3(2)①.

② The minimum requirements for close-up surveys of double hull oil tankers are given in Table 5.6.4.3(2)②.

(3) The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

① in particular, tanks having structural arrangements or details which have suffered defects in similar tanks or on similar ships according to available information;

② in tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

---

① Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

(4) For areas in tanks where hard protective coatings are found to be in a GOOD condition as defined in 5.1.5.1(15), the extent of close-up surveys according to Table 5.6.4.3(2)① or ② may be specially considered.

Minimum Requirements for Close-up Surveys at Special Surveys of Oil Tankers, Ore/Oil Ships, etc.

Table 5.6.4.3(2)①

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age >15
(A) One web frame ring (in a ballast wing tank, if any, or a cargo wing tank used primarily for water ballast). (B) One deck transverse (in a cargo oil tank). (D) One transverse bulkhead (in a ballast tank). (D) One transverse bulkhead (in a cargo oil tank). (D) One transverse bulkhead (in a cargo oil centre tank)	(A) All web frame rings (in a ballast wing tank, if any, or a in cargo wing tank, used primarily for water ballast). (B) One deck transverse (in each of the remaining ballast tanks, if any). (B) One deck transverse (in a cargo wing tank). (B) One deck transverse (in two cargo centre tanks). (C) Both transverse bulkheads (in a wing ballast tank, if any, or a cargo wing tank used primarily for water ballast. (D) One transverse bulkhead (in each remaining ballast tank). (D) One transverse bulkhead (in a cargo oil wing tank). (D) One transverse bulkhead (in two cargo centre tanks)	(A) All web frame rings (in all ballast tanks). (A) All web frame rings (in a cargo wing tank). (A) A minimum of 30%① of all complete transverse web frame rings in each remaining cargo wing tank. (C) All transverse bulkheads (in all cargo and ballast tanks. (E) A minimum of 30%① of deck and bottom transverses including adjacent structural members in each cargo centre tank. (F) As considered necessary by the Surveyor	As special survey No.3; additional transverses included as deemed necessary by CCS

Notes: (A) Complete transverse web frame ring including adjacent structural members.
(B) Deck transverse including adjacent deck structural members.
(C) Transverse bulkhead complete—including girder system and adjacent structural members.
(D) Transverse bulkhead lower part—including girder system and adjacent structural members.
(E) Deck and bottom transverse—including adjacent structural members.
(F) Additional complete transverse web frame ring.

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
(1), (2), (3), (4), (5), (6) and (7) are areas to be subjected to close-up surveys and thickness measurements (see Figure 5.6.4.3(2)②): (1) Web frame in a ballast tank means vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in double deck tank (where fitted), including adjacent structural members. In fore and aft peak ballast tanks, web frame means a complete transverse web frame ring including adjacent structural members. (2) Deck transverse, including adjacent deck structural members (or external structure on deck in way of the tank, where applicable). (3) Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower and upper stools, where fitted. (4) Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members, such as longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets. (5) Transverse bulkhead lower part in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower stool, where fitted. (6) The knuckle area and the upper part (5 m approximately), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the slope hopper plating to the inner hull bulkhead and the inner bottom plating, up to 2 m from the corners both on the bulkhead and the double bottom. (7) Web frame in a cargo oil tank means deck transverse, longitudinal bulkhead structural elements and cross ties, where fitted, including adjacent structural members.			

Notes: 1 Ballast tank: Apart from the fore and aft peak tanks, the term "ballast tank" has the following meaning:

① all ballast compartments (hopper tank, side tank and double-deck tank, if separate from double-bottom tank) located on one side, i.e. portside or starboard side, and additionally double-bottom tank on portside plus starboard side, when the longitudinal central girder is not watertight and, therefore, the doublebottom tank is a unique compartment from portside to starboard side; or

② all ballast compartments (double-bottom tank, hopper tank, side tank and double-deck tank) located on one side, i.e. portside or starboard side, when the longitudinal central girder is watertight and, therefore, the portside double-bottom tank separate from the starboard-side double-bottom tank..

2 Where no centre cargo tanks are fitted (as in the case of center longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

5.6.4.4 Extent of thickness measurement

(1) The minimum requirements for thickness measurements at special surveys are given in Table 5.6.4.4(1)① For ships not having the notation ESP, the minimum requirements for thickness measurements are given in Table 5.6.4.4(1)②.

(2) Provisions for extended measurements for areas with substantial corrosion are given as follows, and as may be additionally specified in the survey programme as required by 5.1.6.5. For ships not having the notation ESP, provisions for extended measurements for areas with substantial corrosion are given in Table 5.4.4.2(17)②.

① For oil tankers, the provisions for extended measurements of areas with substantial corrosion are given in Table 5.6.4.4(2)①a to d.

② For double hull oil tankers, the provisions for extended measurements of areas with substantial corrosion are given in Table 5.6.4.4(2)②a to e. For CSR ships, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out at annual and intermediate surveys.

These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

(3) The Surveyor may further extend the thickness measurements as deemed necessary.

(4) For areas in tanks where hard protective coating is found to be in a GOOD condition as defined in 5.1.5.1(15), the extent of thickness measurements according to Table 5.6.4.4(1) may be specially considered.

(5) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

(6) In cases where two or three sections are to be measured, at least one is to include a ballast tank within 0.5*L* amidships.

In case of oil tankers of 130 m in length and upwards (as defined in the International Convention on Load Lines in force) and more than 10 years of age, for the evaluation of the ship's longitudinal strength as required in 5.6.1.3, the sampling method of thickness measurements is given in Annex 3 to Appendix 2 of

this Chapter.
(7) For the assessment of thickness measurement results, see 5.4.4.2(17)⑤ of this Chapter.

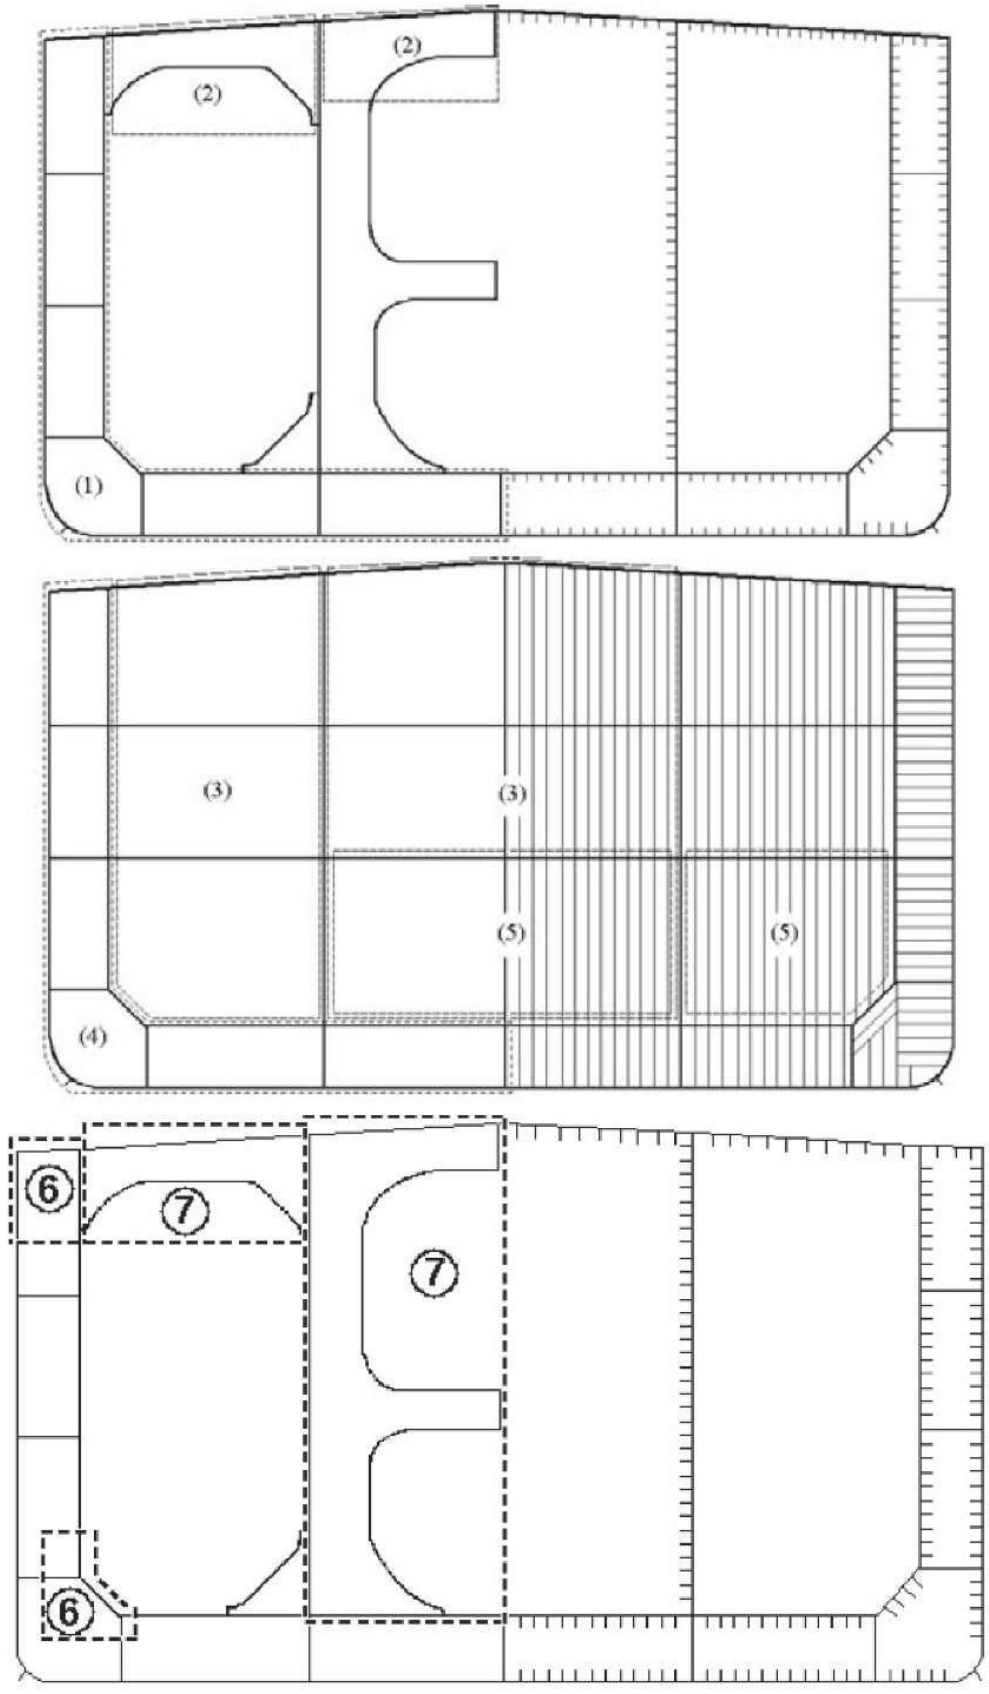

Figure 5.6.4.3(2)②　Close-up Survey Requirements for Double Hull Oil Tankers Areas (1) to (7)

Minimum Requirements for Thickness Measurements at Special Surveys of Oil Tankers, Ore/Oil Ships, etc. **Table 5.6.4.4(1)①a**

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
1. One section of deck plating for the full beam of the ship within the cargo area (in way of a ballast tank, if any, or a cargo tank used primarily for water ballast). 2. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tables 5.6.4.3(2)① of this Section. 3. Suspect areas	1. Within the cargo area: a) Each deck plate. b) One transverse section. 2. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tables 5.6.4.3(2)① of this Section. 3. Suspect areas. 4. Selected wind and water strakes outside the cargo area	1. Within the cargo area: a) Each deck plate. b) Two transverse sections(1). c) All wind and water strakes. 2. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tables 5.6.4.3(2)① of this Section. 3. Suspect areas. 4. Selected wind and water strakes outside the cargo area	1. Within the cargo area: a) Each deck plate. b) Three transverse sections(1). c) Each bottom plate. 2. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tables 5.6.4.3(2)① of this Section. 3. Suspect areas. 4. All wind and water strakes, full length

Note: (1) At least one section is to include a ballast tank within 0.5*L* amidships.

Special Survey No.1 Age ≤ 5	**Special Survey No.2 5 < Age ≤ 10**	**Special Survey No.3 10 < Age ≤ 15**	**Special Survey No.4 and Subsequent Age > 15**
1. Suspect areas	1. Suspect areas 2. Within the cargo area: a) Each deck plate b).2 One transverse section 3. Selected wind and water strakes outside the cargo area 4. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table 5.6.4.3(2)②	1. Suspect areas 2. Within the cargo area: a) Each deck plate b) Two transverse section(1) c) All wind and water strakes 3. Selected wind and water strakes outside the cargo area 4. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table 5.6.4.3(2)②	1. Suspect areas 2. Within the cargo area: a) Each deck plate b) Three transverse section(1) c) Each bottom plate 3. All wind and water strakes, full length. 4. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table 5.6.4.3(2)②

Note: (1) At least one section is to include a ballast tank within 0.5*L* amidships.

Minimum Requirements for Thickness Measurements at Special Surveys of Oil Tankers (Including Double Hull Oil Tankers), Ore/Oil Ships, etc., not having the notation ESP **Table 5.6.4.4(1)②**

Age ≤ 10	10 < age ≤ 15	Age > 15
1. Suspect areas throughout the ship	1. Suspect areas throughout the ship	1. Suspect areas throughout the ship
	2. Within the cargo area: a) Each deck plate. b) Two transverse sections. c) All wind and water strakes	2. Within the cargo area: a) Each deck plate. b) Three transverse sections. c) Each bottom plate
	3. Selected wind and water strakes outside the cargo area	3. For combined carrier, all cargo hold hatch covers and coamings (plating and stiffeners)
		4. Internals in forepeak and afterpeak ballast tanks
		5. All exposed main deck plating full length
		6. Representative exposed superstructure deck plating (poop, bridge, and forecastle deck)

Age ≤ 10	10 < age ≤ 15	Age > 15
		7. Lowest strake and centre strake in way of all transverse bulkheads in cargo spaces together with internals in way
		8. All wind and water strakes, port and starboard, full length
		9. All keel plates full length. Also, additional bottom plates in way of cofferdams, machinery space, and aft end of tanks
		10. Plating of sea chests. Shell plating in way of overboard discharges as considered necessary by the attending Surveyor

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
(Special Survey of Oil Tankers, Ore/Oil Ships, etc., within the Cargo Tank Length)
Bottom Structure **Table 5.6.4.4(2)①a**

Structural Member	Extent of Measurement	Pattern of Measurement
1. Bottom plating	Minimum of 3 bays across tank including aft bay. Measurements around and under all bell mouths	5-point pattern for each panel between longitudinals and webs
2. Bottom longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertical web
3. Bottom girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across face flat. 5-point pattern on girder/bulkhead brackets
4. Bottom transverse webs	3 webs in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over about 2 m^2 area. Single measurement on face flat
5. Panel stiffening	Where applicable	Single measurements

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
(Special Survey of Oil Tankers, Ore/Oil Ships, etc., within the Cargo Tank Length)
Deck Structure **Table 5.6.4.4(2)①b**

Structural Member	Extent of Measurement	Pattern of Measurement
1. Deck plating	Two bands across tank	Minimum of three measurements per plate per band
2. Deck longitudinals	Minimum of 3 longitudinals in each of two bays	3 measurements in line vertically on webs, and 2 measurements on flange (if fitted)
3. Deck girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurement on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across face flat. 5-point pattern on girder/bulkhead brackets
4. Deck transverse webs	Minimum of two webs with measurements at middle and both ends of span	5-point pattern over about 2 m^2 area. Single measurements on face flat
5. Panel stiffening	Where applicable	Single measurements

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
Special Survey of Oil Tankers, Ore/Oil Ships, etc., within the Cargo Tank Length
(Side Shell and Longitudinal Bulkheads) **Table 5.6.4.4(2)①c**

Structural Member	Extent of Measurement	Pattern of Measurement
1. Deckhead and bottom strakes, and strakes in way of stringer platforms	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
2. All other strakes	Plating between every third pair of longitudinals in same 3 bays	Single measurement
3. Longitudinals－deckhead and bottom strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
4. Longitudinals－all others	Every third longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
5. Longitudinals－brackets	Minimum of three at top, middle and bottom of tank in same 3 bays	5-point pattern over area of bracket
6. Web frames and cross ties	3 webs with minimum of three locations on each web, including in way of cross tie connections	5-point pattern over about 2 m^2 area, plus single measurements on web frame and cross tie face flat

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
(Special Survey of Oil Tankers, Ore/Oil Ships, etc., within the Cargo Tank Length)
Transverse Bulkheads and Swash Bulkheads Table 5.6.4.4(2)①d

Structural Member	Extent of Measurement	Pattern of Measurement
1. Deckhead and bottom strakes, and strakes in way of stringer platforms	Plating between pair of stiffeners at three locations－approx. 1/4, 1/2 and 3/4 width of tank	5-point pattern between stiffeners over 1 m length
2. All other strakes	Plating between pair of stiffeners at middle location	Single measurement
3. Strakes in corrugated bulkheads	Plating for each change of scantling at center of panel and at flange or fabricated connection	5-point pattern over about 1 m^2 of plating
4. Stiffeners	Minimum of three typical stiffeners	For web, 5-point pattern over span between bracket connections (2 measurements across web at each bracket connection, and one at center of span). For flange, single measurements at each bracket toe and at center of span
5. Brackets	Minimum of three at top, middle and bottom of tank	5-point pattern over areas of bracket
6. Deep webs and girders	Measurements at toe of bracket and at center of span	For web, 5-point pattern over about 1 m^2. 3 measurements across face flat
7. Stringer platforms	All stringers with measurements at both ends and middle	5-point pattern over 1 m^2 area plus single measurements near bracket toes and on face flats

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
(Special Survey of Double Hull Oil Tankers within the Cargo Area Length)
Bottom, Inner bottom and Hopper Structure Table 5.6.4.4(2)②a

Structural Member	Extent of Measurement	Pattern of Measurement
1. Bottom, inner bottom and hopper structure plating	Minimum of three bays across double bottom tank, including aft bay. Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
2. Bottom, inner bottom and hopper structure longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across flange and three measurements on vertical web
3. Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements
4. Bottom floors, including the watertight ones	Three floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over two square metre area
5. Hopper structure web frame ring	Three floors in bays where bottom plating measured	5-point pattern over one square metre of plating. Single measurements on flange
6. Hopper structure transverse watertight bulkhead or swash bulkhead	·lower 1/3 of bulkhead	5-point pattern over one square metre of plating
	·upper 2/3 of bulkhead	5-point pattern over two square metre of plating
	·stiffeners (minimum of three)	For web, 5-point pattern over span (two measurements across web at each end and one at center of span). For flange, single measurements at each end and center of span
7. Panel stiffening	Where applicable	Single measurements

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion (Special Survey of Double Hull Oil Tankers within the Cargo Area Length)

Deck Structure **Table 5.6.4.4(2)②b**

Structural Member	Extent of Measurement	Pattern of Measurement
1. Deck plating	Two transverse bands across tank	Minimum of three measurements per plate per band
2. Deck longitudinals	Every third longitudinal in each of two bands with a minimum of one longitudinal	three measurements in line vertically on webs and two measurements on flange (if fitted)
3. Deck girders and brackets (usually in cargo tanks only)	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across flange. 5-point pattern on girder/bulkhead brackets
4. Deck transverse webs	Minimum of two webs, with measurements at both ends and middle of span	5-point pattern over one square metre area. Single measurements on flange
5. Vertical web and transverse bulkhead in wing ballast tank (two metres from deck)	Minimum of two webs, and both transverse bulkheads	5-point pattern over one square metre area
6. Panel stiffening	Where applicable	Single measurements

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion (Special Survey of Double Hull Oil Tankers within the Cargo Area Length)

Structure in Wing Ballast Tanks **Table 5.6.4.4(2)②c**

Structural Member	Extent of Measurement	Pattern of Measurement
1. Side shell and longitudinal bulkhead plating:		
Upper strake and strakes in way of horizontal girders.	Plating between each pair of longitudinals in a minimum of three bays (along the tank).	Single measurement.
All other strakes	Plating between every third pair of longitudinals in same three bays	Single measurement
2. Side shell and longitudinal bulkhead longitudinals on:		
Upper strake.	Each longitudinal in same three bays.	3 measurements across web and 1 measurement on flange.
All other strakes	Every third longitudinal in same three bays	3 measurements across web and 1 measurement on flange
3. Longitudinals−brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of bracket
4. Vertical web and transverse bulkheads (excluding deckhead area):		
Strakes in way of horizontal girders.	Minimum of two webs and both transverse bulkheads.	5-point pattern over approx. two square metre area.
Other strakes	Minimum of two webs and both transverse bulkheads	Two measurements between each pair of vertical stiffeners
5. Horizontal girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
6. Panel stiffening	Where applicable	Single measurements

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion (Special Survey of Double Hull Oil Tankers within the Cargo Area Length)
Longitudinal Bulkheads in Cargo Tanks Table 5.6.4.4(2)②d

Structural Member	Extent of Measurement	Pattern of Measurement
1. Deckhead and bottom strakes, and strakes in way of the horizontal stringers of transverse bulkheads	Plating between each pair of longitudinals in a minimum of three bays	Single measurement
2. All other strakes	Plating between every third pair of longitudinals in same three bays	Single measurement
3. Longitudinals on deckhead and bottom strakes	Each longitudinal in same three bays	Three measurements across web and one measurement on flange
4. All other longitudinals	Each third longitudinal in same three bays	Three measurements across web and one measurement on flange
5. Longitudinals - brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of bracket
6. Web frames and cross ties	Three webs with minimum of three locations on each web, including in way of cross tie connections	5-point pattern over approximately two square metre area of webs, plus single measurements on flanges of web frame and cross ties
7. Lower end brackets (opposite side of web frame)	Minimum of three brackets	5-point pattern over approximately two square metre area of brackets, plus single measurements on bracket flanges

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion (Special Survey of Double Hull Oil Tankers within the Cargo Area Length)
Transverse Watertight and Swash Bulkheads in Cargo Tanks Table 5.6.4.4(2)②e

Structural Member	Extent of Measurement	Pattern of Measurement
1. Upper and lower stool, where fitted	Transverse band within 25 mm of welded connection to inner bottom/deck plating Transverse band within 25 mm of welded connection to shelf plate	5-point pattern between stiffeners over one metre length
2. Deckhead and bottom strakes, and strakes in way of horizontal stringers	Plating between pair of stiffeners at three locations: approximately 1/4, 1/2 and 3/4 width of tank	5-point pattern between stiffeners over one metre length
3. All other strakes	Plating between pair of stiffeners at middle location	Single measurement
4. Strakes in corrugated bulkheads	Plating for each change of scantling at center of panel and at flange of fabricated connection	5-point pattern over about one square metre of plating
5. Stiffeners	Minimum of three typical stiffeners	For web, 5-point pattern over span between bracket connections (two measurements across web at each bracket connection and one at center of span). For flange, single measurements at each bracket toe and at center of span
6. Brackets	Minimum of three at top, middle and bottom of tank	5-point pattern over area of bracket
7. Horizontal stringers	All stringers with measurements at both ends and middle	5-point pattern over one square metre area, plus single measurements near bracket toes and on flanges

5.6.4.5 Extent of tank testing

(1) The minimum requirements for ballast tank testing are given in (3) of this paragraph and Table 5.6.4.5(1); the minimum requirements for cargo tank testing are given in (4) of this paragraph and Table 5.6.4.5(1). Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the Surveyor provided the following conditions are complied with:

① a tank testing procedure, specifying fill heights, tanks being filled and bulkheads being tested, has been submitted by the Owner and reviewed by CCS prior to the testing being carried out;

② the tank testing is carried out prior to overall survey or close-up survey;

③ the tank testing is carried out within the special survey window and not more than 3 months prior to

the date on which the overall or close-up survey is completed;

④ the tank testing has been satisfactorily carried out and there is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;

⑤ the satisfactory results of the testing is recorded in the ship's logbook; and

⑥ the internal and external condition of the tanks and associated structure are found satisfactory by the Surveyor at the time of the overall and close-up survey.

(2) The Surveyor may extend the tank testing as deemed necessary.

(3) Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.

(4) Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.

(5) For double hull oil tankers, the testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

Minimum Requirements to Tank Testing at Special Surveys of Oil Tankers (Including Double Hull Oil Tankers), Ore/Oil Ships, etc. **Table 5.6.4.5(1)**

Special Survey No.1 Age ≤ 5	Special Survey No.2 and Subsequent Age > 5
1. All ballast tank boundaries 2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	1. All ballast tank boundaries 2. All cargo tank bulkheads

5.6.4.6 Examination of emergency towing arrangements (if fitted)

(1) Confirming that strong points, towing pennants, towing connection, pick-up gear, chafing gear and mark buoys are in good and efficient condition.

(2) Verifying that wear of towing pennant, pick-up gear and chafing gear is under permissible limits.

(3) Verifying that fairleads are maintained in a normal condition as required.

5.6.4.7 The availability and normal maintenance of bow and stern loading/unloading arrangements (if fitted) are to be verified.

5.6.4.8 Automatic air pipe heads

(1) For examination of automatic air pipe heads installed on the exposed decks, reference is to be made to 5.4.4.2(18) of this Chapter.

Section 7 ADDITIONAL REQUIREMENTS FOR HULL AND EQUIPMENT SURVEYS OF BULK CARRIERS

5.7.1 General requirements

5.7.1.1 Application

(1) This Section applies to surveys of hull, equipment and piping systems for all bulk carriers or the double skin bulk carriers as defined in 5.1.5.3(2) of this Chapter.

(2) This Section applies to surveys of hull structure and piping systems in way of the cargo holds, cofferdams, pipe tunnels, void spaces, fuel oil tanks within the cargo length area and all ballast tanks. The requirements of this Section are additional to the classification requirements applicable to the remainder of the ship.

(3) This Section contains the minimum extent of examination, thickness measurement and tank testing. The survey is to be extended when substantial corrosion and/or structural defects are found and include additional close-up survey when necessary.

(4) Ships which are required to comply with Appendix 17 of this Chapter are subject to the additional thickness measurement guidance contained in Appendix 3 of this Chapter for the purpose of determining compliance with Appendix 17 of this Chapter prior to the relevant compliance deadline stipulated in Appendix 19 of this Chapter and at subsequent intermediate surveys (for ships over 10 years of age) and special surveys for the purpose of verifying continuing compliance with Appendix 17 of this Chapter.

(5) Ships which are required to comply with Appendix 20 of this Chapter are subject to the additional thickness measurement guidance contained in Appendix 6 of this Chapter for the purpose of determining compliance with Appendix 20 of this Chapter prior to the relevant compliance deadline stipulated in Appendix 20 of this Chapter and at subsequent intermediate and special surveys for the purpose of verifying continuing compliance with Appendix 20 of this Chapter.

(6) For bulk carriers with hybrid cargo hold arrangements, e.g. with some cargo holds of single side skin and others of double side skin, the requirements of this Section for single side skin bulk carriers are to apply to cargo holds of single side skin and the requirements of this Section for double side skin bulk carriers are to apply to cargo holds of double side skin and associated wing spaces.
(7) For existing bulk carriers, where owners may select to coat or recoat cargo holds as required by 1.6.1.3 of Chapter 1, PART TWO of the Rules, consideration may be given to the extent of the close-up and thickness measurement surveys. Prior to the coating of cargo holds of such ships, scantlings are to be ascertained in the presence of a Surveyor.
5.7.1.2 Except as stated otherwise, the requirements regarding double skin bulk carriers in this Section apply to double side skin bulk carriers and bulk carriers of which the distance between inner hull and outer hull is less than 1,000 mm, as required by Chapter 8 of PART TWO of the Rules.

5.7.2 Annual surveys
5.7.2.1 General requirements
(1) The annual survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, weather deck hatch covers, coamings and piping are maintained in a satisfactory condition and should take into account the service history, condition and extent of the corrosion prevention system of ballast tanks and areas identified in the survey report file.
(2) The annual survey is to include the items specified in 5.7.2.2 through 5.7.2.6 and in addition, the applicable items specified in 5.4.2 of this Chapter.
5.7.2.2 Hull
(1) Examination of the hull plating and its closing appliances as far as can be seen.
(2) Examination of watertight penetrations as far as practicable.
5.7.2.3 Weather decks, hatch covers and coamings
(1) Confirmation is to be obtained that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey.
(2) A thorough survey of cargo hatch covers and coamings is only possible by examination in the open as well as closed positions and is to include verification of proper opening and closing operation. As a result, the hatch cover sets within the forward 25% of the ship's length and at least one additional set, such that all sets on the ship are assessed at least once in every 5-year period, are to be surveyed open, closed and in operation to the full extent in each direction at each annual survey, including:
① stowage and securing in open condition;
② proper fit and efficiency of sealing in closed condition; and
③ operational testing of hydraulic and power components, wires, chains and link drives.
The closing of the covers is to include the fastening of all peripheral, and cross joint cleats or other securing devices. Particular attention is to be paid to the condition of hatch covers in the forward 25% of the ship's length, where sea loads are normally greatest.
(3) If there are indications of difficulty in operating and securing hatch covers, additional sets above those required by (2), at the discretion of the Surveyor, are to be tested in operation.
(4) Where the cargo hatch securing system does not function properly, repairs are to be carried out under the supervision of CCS. Where hatch covers or coamings undergo substantial repairs, the strength of securing devices should be upgraded to comply with the requirements of 8.11.5, Section 11, Chapter 8, PART TWO of the Rules.
(5) For each cargo hatch cover set, at each annual survey, the following items are to be surveyed:
① cover panels, including side plates, and stiffener attachments that may be accessible in the open position by close-up survey (for corrosion, cracks, deformation);
② sealing arrangements of perimeter and cross joints (gaskets for condition and permanent deformation, flexible seals on combination carriers, gasket lips, compression bars, drainage channels and non-return valves);
③ clamping devices, retaining bars, cleating (for wastage, adjustment, and condition of rubber components);
④ closed cover locating devices (for distortion and attachment);
⑤ chain or rope pulleys;
⑥ guides;
⑦ guide rails and track wheels;
⑧ stoppers;
⑨ wires, chains, tensioners and gypsies;

⑩ hydraulic system, electrical safety devices and interlocks; and

⑪ end and interpanel hinges, pins and stools, where fitted.

(6) At each hatchway, at each annual survey, the coamings, with plating, stiffeners and brackets are to be checked for corrosion, cracks and deformation, especially of the coaming tops, including close-up survey.

(7) Where considered necessary by the Surveyor, the effectiveness of sealing arrangements may be proved by hose or chalk testing supplemented by dimensional measurements of seal compressing components.

(8) Where portable covers, wooden or steel pontoons are fitted, checking the satisfactory condition, where applicable, of:

① wooden covers and portable beams, carriers or sockets for the portable beam, and their securing devices;

② steel pontoons, including close-up survey of hatch cover plating;

③ tarpaulins;

④ cleats, battens and wedges;

⑤ hatch securing bars and their securing devices;

⑥ loading pads/bars and the side plate edge;

⑦ guide plates and chocks;

⑧ compression bars, drainage channels and drain pipes (if any).

(9) Examination of flame screens on vents to all bunker tanks.

(10) Examination of bunker and vent piping systems, including ventilators.

5.7.2.4 Examination of cargo holds

(1) Bulk carriers 10 to 15 years of age

① Bulk carriers:

a. Overall survey of all cargo holds.

b. Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in the forward cargo hold. Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a close-up survey of sufficient extent of all remaining cargo holds.

c. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tables 5.7.4.5(2)①a to e. These thickness measurements are to be carried out before the annual survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken. For CSR ships, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in "GOOD" condition.

d. Where the protective coating (as required by 1.6.1.3 of Chapter 1, PART TWO of the Rules) in cargo holds is found to be in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

e. All piping and penetrations in cargo holds, including overboard piping, are to be examined.

② Double side skin bulk carriers:

a. Overall survey of two selected cargo holds.

b. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tables 5.7.4.5(2)②a to d. These extended thickness measurements are to be carried out before the annual survey is credited as complete. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken. For CSR ships, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in "GOOD" condition.

c. All piping and penetrations in cargo holds, including overboard piping, are to be examined.

(2) Bulk carriers over 15 years of age

① Bulk carriers:

a. Overall survey of all cargo holds.

b. Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in the forward cargo hold and one other selected cargo hold. Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a close-up survey of sufficient extent of all remaining cargo holds.

c. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tables 5.7.4.5(2)①a to e. These extended thickness measurements are to be carried out before the annual survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken. For CSR ships, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in "GOOD" condition.

d. Where a hard protective coating as required by 1.6.1.3 of Chapter 1, PART TWO of the Rules is fitted in cargo holds and is found in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

e. All piping and penetrations in cargo holds, including overboard piping, are to be examined.

② Double side skin bulk carriers:

a. Overall survey of all cargo holds.

b. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tables 5.7.4.5(2)②a to d. These extended thickness measurements are to be carried out before the annual survey is credited as complete. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken. For CSR ships, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in "GOOD" condition.

c. All piping and penetrations in cargo holds, including overboard piping, are to be examined.

5.7.2.5 Examination of ballast tanks

(1) Examination of ballast tanks when required as a consequence of the results of the special survey and intermediate survey is to be carried out. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tables 5.7.4.5(2)①a to e for bulk carriers or in accordance with Tables 5.7.4.5(2)②a to d for double skin bulk carriers. These extended thickness measurements are to be carried out before the survey is credited as completed.

Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken. For CSR ships, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in "GOOD" condition.

(2) Confirming that the corrosion prevention system fitted to dedicated ballast tanks of bulk carriers when appropriate is maintained.

5.7.2.6 Additional annual survey requirements after determining compliance with SOLAS XII/12 and XII/13:

(1) For ships complying with the requirements of SOLAS XII/12 for hold, ballast and dry space water level detectors, the annual survey is to include an examination and a test, at random, of the water ingress detection systems and of their alarms.

(2) For ships complying with the requirements of SOLAS XII/13 for the availability of pumping systems, the annual survey is to include an examination and a test, of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold, and of their controls.

5.7.2.7 In the case of bulk carriers of 150 m in length and upwards of single side skin construction, carrying solid bulk cargoes having a density of 1,780 kg/m^3 and above, contracted for construction before 1 July 1999 and constructed with an insufficient number of transverse watertight bulkheads to enable them to

withstand flooding of the foremost cargo hold in all loading conditions and remain afloat in a satisfactory condition of equilibrium as specified in SOLAS XII/4.3, the following additional survey requirements for the foremost cargo hold of such ships are to apply:

(1) Bulk carriers over 5 and up to 15 years of age

① An overall survey of No.1 cargo hold, including a close-up survey of sufficient extent, minimum 25% of frames, is to be carried out to establish the technical condition of shell frames including their upper and lower end attachments, adjacent shell plating, transverse bulkheads and areas found suspect at the previous surveys.

② Where considered necessary by the Surveyor as a result of the overall and close-up surveys as described in ① above, the survey is to be extended to include a close-up survey of all of the shell frames, their end attachments and adjacent shell plating of that cargo hold.

(2) Bulk carriers over 15 years of age

① An overall survey of No.1 cargo hold, including a close-up survey, is to be carried out to establish the technical condition of all shell frames including their end attachments, adjacent shell plating, transverse bulkheads and areas found suspect at previous surveys.

(3) Extent of thickness measurements

① Thickness measurements are to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up surveys as described in (1)① and ② above. As a minimum, thickness measurements are to be carried out at areas found suspect at previous surveys. Where substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tables 5.7.4.5(2)①a to e of this Section.

② The thickness measurements may be dispensed with provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution and the protective coating, where applied, remains effective.

(4) Where the protective coating in No.1 cargo hold is found to be in GOOD condition (in compliance with 1.6.1.3 of Chapter 1, PART TWO of the Rules), the extent of close-up survey and thickness measurements may be specially considered.

5.7.2.8 Examining, for bulk carriers of 150 m and above, where appropriate, the ship's structure in accordance with the Ship Construction File, taking into account identified areas that need special attention.

5.7.2.9 Examination of double-side skin void spaces for bulk carriers exceeding 20 years of age and of 150 m in length and upwards

(1) Examination of double-side skin void spaces, for bulk carriers exceeding 20 years of age and of 150 m in length and upwards, are to be carried out as required by 5.7.4.2(4) and 5.7.3.4(1) of this Section. When considered necessary by the Administration, or when extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Table 5.7.4.5(2)②a～d of this Section. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

(2) For CSR ships, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition.

5.7.3 Intermediate surveys

5.7.3.1 General requirements

(1) The intermediate survey extent is dependent on the age of the ship as specified in 5.7.3.2 to 5.7.3.4 of this Section.

(2) The intermediate survey is also to include the applicable items specified in 5.4.3 of this Chapter and 5.7.2 of this Section.

(3) The survey requirements for double skin bulk carriers are also to be in compliance with Table 5.7.3.1(3).

Minimum Requirements of Overall and Close-Up Survey and Thickness Measurements at Intermediate Survey of Double Skin Bulk Carriers **Table 5.7.3.1(3)**

5 < Age ≤ 10	10 < Age ≤ 15	Age > 15
Overall survey of representative ballast tanks selected by the attending Surveyor (the selection is to include fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks)	The requirements of the previous special survey (See 5.7.3.3)	The requirements of the previous special survey (See 5.7.3.4)

Overall and close-up survey of suspect areas identified as previous (intermediate or special) surveys		
Overall survey of all cargo holds		
Thickness measurements to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey at suspect areas identified at previous surveys		

5.7.3.2 Bulk carriers 5 to 10 years of age

① Ballast tanks

a. For tanks used for water ballast, an overall survey of representative spaces selected by the Surveyor is to be carried out. The selection is to include fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks. If such overall survey reveals no visible structural defects, the examination may be limited to verification that the corrosion prevention system remains efficient.

b. Where a hard coating is found to be in less than GOOD condition, corrosion or other structural defects are found in water ballast tanks or where a hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.

c. In ballast tanks other than double bottom tanks, where a hard protective coating is found to be in less than GOOD condition and it is not renewed, or where a soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question are to be examined and thickness measurements carried out as considered necessary at annual intervals. When such breakdown of hard protective coating is found in ballast double bottom tanks, or where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

d. In addition to the requirements above, suspect areas identified at previous surveys are to be subjected to overall and close-up surveys.

② Cargo holds

a. Bulk carriers

(a) An overall survey of all cargo holds, including close-up survey of sufficient extent, minimum 25 % of frames, is to be carried out to establish the condition of:

a) shell frames including their upper and lower end attachments, adjacent shell plating, and transverse bulkheads in the forward cargo hold and one other selected cargo hold;

b) areas found suspect at previous surveys.

(b) Where considered necessary by the Surveyor as a result of the overall and close-up survey as described in (a) above, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a close-up survey of sufficient extent of all remaining cargo holds.

b. Double skin bulk carriers

(a) An overall survey of all cargo holds is to be carried out.

(b) Where considered necessary by the Surveyor as a result of the overall survey as described in (a) above, the survey is to be extended to include a close-up survey of those areas of structure in the cargo holds selected by the Surveyor.

③ Extent of thickness measurements

a. Bulk carriers

(a) Thickness measurements are to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey as described in 5.7.3.2②a(a). The minimum requirement for thickness measurements at the intermediate survey are areas found to be suspect areas at previous surveys.

(b) The extent of thickness measurement may be specially considered provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution and the hard protective coatings are found to be in a GOOD condition.

(c) Where substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of Tables 5.7.4.5(2)①a to e. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

For CSR ships, the identified substantial corrosion areas may be:

a) protected by coating applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in "GOOD" condition, or alternatively

b) required to be measured at annual intervals.

(d) Where the hard protective coating (as required by 1.6.1.4 of Chapter 1, PART TWO of the Rules) in cargo holds is found to be in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered. For existing bulk carriers, where owners may select to coat or recoat cargo holds as noted above, special consideration may be given to the extent of close-up surveys and thickness measurements. Prior to the coating of cargo holds of existing ships, scantlings are to be ascertained by the Surveyor.

b. Double skin bulk carriers

(a) Thickness measurements are to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey, where required as per 5.7.3.2②b(b), and as provided in 5.7.3.2.①c.

(b) The extent of thickness measurement may be specially considered provided the Surveyor is satisfied by the close-up survey that there is no structural diminution and the hard protective coatings are found to be in a GOOD condition.

(c) Where substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of Tables 5.7.4.5(2)②a to d. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

For CSR ships, the identified substantial corrosion areas may be:

a) protected by coating applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in "GOOD" condition, or alternatively

b) required to be measured at annual intervals.

(d) Where the protective coating in cargo holds (as required by 1.6.1.3 of Chapter 1, PART TWO of the Rules) is found to be in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered. Prior to the coating of cargo holds, scantlings should be ascertained in the presence of the Surveyor. For existing bulk carriers, where owners may select to coat or recoat cargo holds as noted above, special consideration may be given to the extent of close-up surveys and thickness measurements. Prior to the coating of cargo holds of existing ships, scantlings are to be ascertained by the Surveyor.

5.7.3.3 Bulk carriers 10 to 15 years of age

(1) The requirements of the intermediate survey are to be to the same extent to the previous special survey as required in 5.7.4 of this Section and 5.1.6.5. However, internal examination of fuel tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.

(2) In application of (1), the intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey in lieu of the application of 5.2.4.2.

(3) In application of (1), an underwater survey may be considered in lieu of the requirements of 5.7.4.1(5).

5.7.3.4 Bulk carriers over 15 years of age

(1) The requirements of the intermediate survey are to be to the same extent to the previous special survey as required in 5.7.4 of this Section and 5.1.6.5. However, internal examination of fuel tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.

(2) In application of (1), the intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey in lieu of the application of 5.2.4.2.

(3) A survey in dry dock is to be part of the intermediate survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and ballast tanks① are to be carried out in accordance with the applicable requirements for intermediate surveys, if not already performed.

5.7.4 Special surveys

5.7.4.1 General requirements

---

① Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.

(1) The special survey is to include, in addition to the applicable requirements of 5.4.4 of this Chapter and 5.7.2 of this Section, examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in 5.7.4.1(3), is in a satisfactory condition and is fit for its intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.
(2) All cargo holds, ballast tanks, including double bottom tanks, pipe tunnels, cofferdams, double side tanks (if fitted) and void spaces bounding cargo holds, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in 5.7.4.5 and 5.7.4.6, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.
(3) All piping systems (or ballast piping systems in the case of double skin bulk carriers) within the above spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.
(4) The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.
(5) A survey in dry dock is to be a part of the special survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and ballast tanks (Note: Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line) are to be carried out in accordance with the applicable requirements for special surveys, if not already performed.

5.7.4.2 Space protection

(1) Where provided, the condition of the corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom tanks, where a hard protective coating is found to be in less than GOOD condition and it is not renewed, or where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the Surveyor.
(2) When such breakdown of hard protective coating is found in water ballast double bottom tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.
(3) Where a hard protective coating is provided in cargo holds and is found in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.
(4) For double-side skin void spaces bounding cargo holds for bulk carriers exceeding 20 years of age and of 150 m in length and upwards, where provided, the condition of the corrosion prevention system of void spaces is to be examined. Where a hard protective coating is found to be in POOR condition, and it is not renewed, or where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the void spaces in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the surveyor.

5.7.4.3 Hatch covers and coamings

(1) A thorough inspection of the items listed in 5.7.2.3 is to be carried out, in addition to all hatch covers and coamings.
(2) Checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:
① stowage and securing in open condition;
② proper fit and efficiency of sealing in closed condition;
③ operational testing of hydraulic and power components, wires, chains, and link drives.
(3) Checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent.
(4) Close-up survey and thickness measurement① of the hatch cover and coaming plating and stiffeners is to be carried out for bulk carriers and double skin bulk carriers as given in Table 5.7.4.4(1)②, 5.7.4.4(2)② and Tables 5.7.4.5(1)① and ②.

5.7.4.4 Extent of overall and close-up surveys

(1) Bulk carriers

---

① Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/thickness measurement shall be done of accessible parts of hatch covers structures.

① An overall survey of all tanks and spaces is to be carried out at each special survey. Fuel oil tanks in the cargo length area are to be surveyed in accordance with Table 5.4.4.2(2) of this Chapter.
② The minimum requirements for close-up surveys at special survey are given in Table 5.7.4.4(1)② of this Section. For ships not having the notation ESP, the Surveyor may carry out the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system.
③ The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.
④ For areas in spaces where hard protective coatings are found to be in a GOOD condition, the extent of close-up surveys according to Table 5.7.4.4(1)② may be specially considered.

Minimum Requirements for Close-up Survey at Special Hull Survey of Bulk Carriers

Table 5.7.4.4(1)②

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
(A) 25% of shell frames in the forward cargo hold at representative positions. (A) Selected frames in remaining cargo holds. (B) One transverse web with associated plating and longitudinals in two representative water ballast tanks of each type (i.e. topside, hopper side tank). (C) Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted. (D) All cargo hold hatch covers and coamings (plating and stiffeners)	(A) All shell frames in the forward cargo hold and 25% of shell frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating. For bulk carriers of 100,000 DWT and above, all shell frames in the forward cargo hold and 50% of shell frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating①. (B) One transverse web with associated plating and longitudinals in each water ballast tank. (B) Forward and aft transverse bulkhead in one ballast tank, including stiffening system. (C) All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted. (D) All cargo hold hatch covers and coamings (plating and stiffeners). (E) All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches	(A) All shell frames in the forward and one other selected cargo hold and 50% of frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating. (B) All transverse webs with associated plating and longitudinals in each water ballast tank. (B) All transverse bulkheads in ballast tanks, including stiffening system. Areas (C), (D) and (E) as for Special Survey No.2	(A) All shell frames in all cargo holds including upper and lower end attachments and adjacent shell plating. Areas (B) to (E) as for special survey No.3

① This requirement applies to surveys of bulk carriers of 100,000 DWT and above on and after 1 July 2007.

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
Notes: (A), (B), (C), (D) and (E) are areas to be subjected to close-up surveys and thickness measurements (See Figure 5.7.4.4(2)): (A) Cargo hold transverse frames. (B) Transverse web frame or watertight transverse bulkhead in water ballast tanks. (C) Cargo hold transverse bulkhead plating, stiffeners and girders. (D) Cargo hold hatch covers and coamings. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/thickness measurement is to be done of accessible parts of hatch covers structures. (E) Deck plating and under deck structure inside line of hatch openings between cargo hold hatches. Close-up survey of transverse bulkheads are to be carried out at the following levels: a. Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool. b. Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates. c. About mid-height of the bulkhead. d. Immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.			

(2) Double skin bulk carriers

① An overall survey of all tanks and spaces is to be carried out at each special survey. Fuel oil tanks in the cargo length area are to be surveyed in accordance with Table 5.4.4.2(2) of this Chapter.

② The minimum requirements for close-up surveys at special survey of double skin bulk carriers are given in Table 5.7.4.4(2)②. The minimum requirements for close-up surveys at special survey of ore carriers are given in Table 5.7.4.4(2)③.

③For ships not having the notation ESP, the Surveyor may carry out the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system.

④ The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

⑤ For areas in spaces where hard protective coatings are found to be in a GOOD condition, the extent of close-up surveys according to Table 5.7.4.4(2)② or Table 5.7.4.4(2) ③ may be specially considered.

Minimum Requirements for Close-Up Survey at Special Hull Survey of Double Skin Bulk Carriers, Excluding Ore Carriers **Table 5.7.4.4(2)②**

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
One transverse web with associated plating and longitudinals in two representative ballast tanks of each type (This is to include the foremost topside and double side ballast tanks on either side) (A)	One transverse web with associated plating and longitudinals as applicable in each ballast tank (A). Forward and aft transverse bulkheads including stiffening system in a transverse section including topside, hopper side and double side ballast tanks on one side of the ship (i.e. port or starboard) (A)	All transverse webs with associated plating and longitudinals as applicable in each water ballast tank (A). All transverse bulkheads including stiffening system in each water ballast tank (A)	All transverse webs with associated plating and longitudinals as applicable in each water ballast tank (A). All transverse bulkheads including stiffening system in each water ballast tank. (A)
	25% of ordinary transverse frames for transverse framing system or 25% of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts, in the foremost double side tanks (B)	25% of ordinary transverse frames for transverse framing system or 25% of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts, in all double side tanks (B)	All ordinary transverse frames for transverse framing system or all of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts, in all double side tanks (B)
Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (C)	One transverse bulkhead in each cargo hold, including internal structure of upper and lower stools, where fitted (C)	All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (C)	Areas (C) to (E) as for age interval 10 to 15 years
All cargo hold hatch covers and coamings (platings and stiffeners) (D)	All cargo hold hatch covers and coamings (platings and stiffeners) (D)	All cargo hold hatch covers and coamings (platings and stiffeners) (D)	
	All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches (E)	All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches (E)	

Note: (A), (B), (C), (D) and (E) are areas to be subjected to close-up surveys and thickness measurements (see Figure 5.7.4.4(2)).

(A) Transverse web frame or watertight transverse bulkhead in topside, hopper side and double side ballast tanks. In fore and aft peak tanks transverse web frame means a complete transverse web frame ring including adjacent structural members.

(B) Ordinary transverse frame in double side tanks.

(C) Cargo hold transverse bulkhead plating, stiffeners and girders.

(D) Cargo hold hatch covers and coamings. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/thickness measurement is to be done of accessible parts of hatch covers structures.

(E) Deck plating and under deck structure inside line of hatch openings between cargo hold hatches.

Close-up survey of transverse bulkheads are to be carried out at four levels:

Level (a): Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.

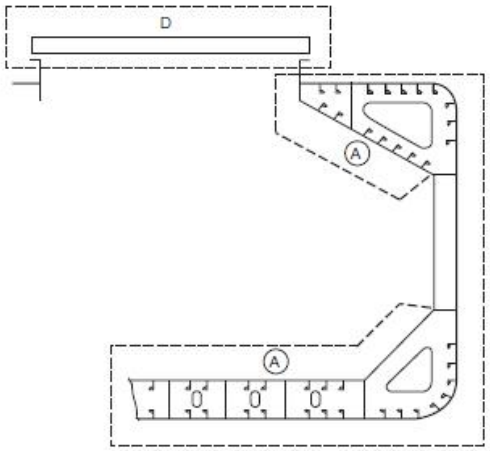
Level (b): Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.

Level (c): About mid-height of the bulkhead.

Level (d): Immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

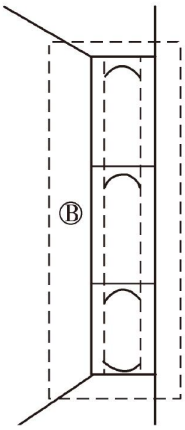
Typical transverse section

Areas (A) and (D)



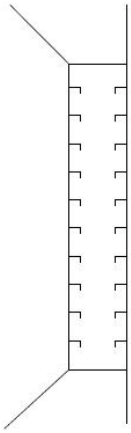
Thickness to be reported on TM3-BC, TM4-BC, TM6-BC and TM7-BC in Appendix 13.2A of this Chapter, as appropriate

Ordinary transverse frame in double skin tank
Area B

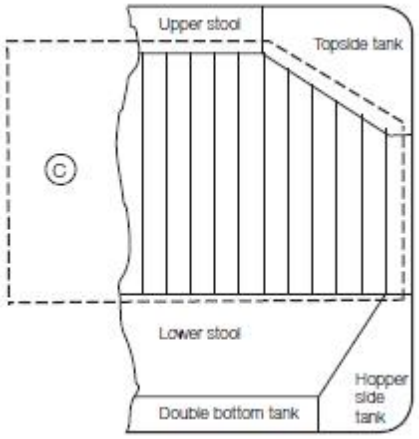


Thickness to be reported on TM4-BC in Appendix 13.2A of this Chapter

Ordinary longitudinal structure in double skin tank

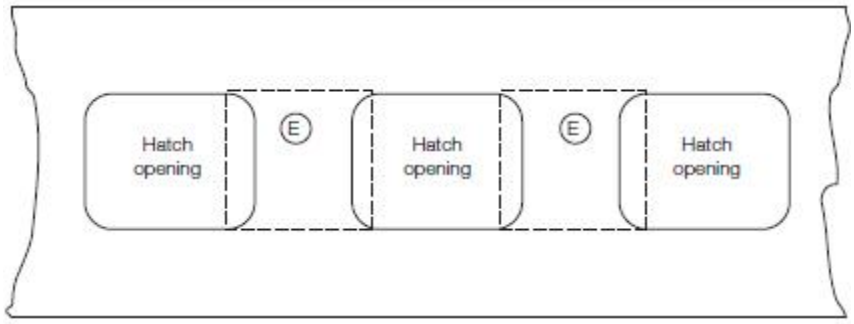


A cargo hold, transverse bulkhead
Area C



Thickness to be reported on TM5-BC in Appendix 13.2A of this Chapter

Typical areas of deck plating and underdeck structure inside line of hatch openings between cargo hold hatches
Area E



Thickness to be reported on TM6-BC in Appendix 13.2A of this Chapter

Figure 5.7.4.4(2) Close-up Survey and Thickness Measurement Areas

Minimum Requirements for Close-Up Survey at Special Hull Survey of Ore Carriers

Table 5.7.4.4(2)③

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
One web frame ring complete including adjacent structural members in a ballast wing tank (A) One transverse bulkhead lower part – including girder system and adjacent structural members - in a ballast tank (A)	All web frame rings complete including adjacent structural members in a ballast wing tank (A) One deck transverse including adjacent deck structural members in each remaining ballast tank (A) Forward and aft transverse bulkheads complete – including girder system and adjacent structural members - in a ballast wing tank (A) One transverse bulkhead lower part - including girder system and adjacent structural members - in each remaining ballast tank (A)	All web frame rings complete including adjacent structural members in each ballast tank (A) All transverse bulkheads complete – including girder system and adjacent structural members - in each ballast tank (A) One web frame ring complete including adjacent structural members in each wing void space (A) Additional web frame rings in void spaces as deemed necessary by CCS (A)	As for Special Survey for age from 10 to 15 years
Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (C)	One transverse bulkhead in each cargo hold, including internal structure of upper and lower stools, where fitted (C)	All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (C)	Areas (C) to (E) as for age interval 10 to 15 years
All cargo hold hatch covers and coamings (plating and stiffeners) (D)	All cargo hold hatch covers and coamings (plating and stiffeners) (D)	All cargo hold hatch covers and coamings (plating and stiffeners) (D)	
	All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches (E)	All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches (E)	

Note: (A), (C), (D) and (E) are areas to be subjected to close-up surveys and thickness measurements (see Figure 5.7.4.4(2)).

(A): Transverse web frame or watertight transverse bulkhead in ballast wing tanks and void spaces. In fore and aft peak tanks transverse web frame means a complete transverse web frame ring including adjacent structural members.

(C): Cargo hold transverse bulkheads plating, stiffeners and girders.

(D): Cargo hold hatch covers and coamings. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/thickness measurement is to be done of accessible parts of hatch covers structures.

(E): Deck plating and under deck structure inside line of hatch openings between cargo hold hatches.

Close-up survey of transverse bulkheads to be carried out at four levels:

Level (a): Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.

Level (b): Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.

Level (c): About mid-height of the bulkhead.

Level (d): Immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

5.7.4.5 Extent of thickness measurement

(1) The minimum requirements for thickness measurement at special survey are given in Tables 5.7.4.5(1)① and 5.7.4.5(1)② respectively for bulk carriers and double skin bulk carriers. For ships not having the notation ESP, the minimum requirements for thickness measurements are given in Table 5.7.4.5(1)③.

(2) Provisions for extended measurements for areas with substantial corrosion are given in Tables 5.7.4.5(2)①a to e and 5.7.4.5(2)②a to d respectively for bulk carriers and double skin bulk carriers and as may be additionally specified in the survey programme as required by 5.1.6.5. For ships not having the notation ESP, provisions for extended measurements for areas with substantial corrosion are given in Table 5.4.4.2(17)②. These extended thickness measurements are to be carried out before the survey is credited as

completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.
For CSR ships, the identified substantial corrosion areas may be:

a) protected by coating applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in "GOOD" condition, or alternatively
b) required to be measured at annual intervals.

(3)The Surveyor may further extend the thickness measurements as deemed necessary.
(4) For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurement according to Tables 5.7.4.5(1)① and 5.7.4.5(1)② may be specially considered.
(5) Transverse sections are to be chosen where largest reductions are suspected to occur or are revealed from deck plating measurements, one of which is to be in the amidships area.
(6) Representative thickness measurement to determine both general and local levels of corrosion in the shell frames and their end attachments in all cargo holds and water ballast tanks (for double skin bulk carriers, in the transverse web frames in all water ballast tanks) is to be carried out. Thickness measurement is also to be carried out to determine the corrosion levels on the transverse bulkhead plating. The extent of thickness measurements may be specially considered provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution, and the hard protective coating where applied remains efficient.
(7) Thickness measurements may be carried out at the commencement of the special survey, or the thickness measurement report prepared within 15 months before the due date of the special survey may be taken as the thickness measurement report of the special survey.
(8) For the assessment of thickness measurement results, see 5.4.4.2(17)⑤ of this Chapter.

Minimum Requirements for Thickness Measurements at Special Hull Survey of Bulk Carriers

Table 5.7.4.5(1)①

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
1. Suspect areas	1. Suspect areas. 2. Within the cargo length: Two transverse section of deck plating outside line of cargo openings. 3. Wind and water strakes in way of the two transverse sections considered above and Selected wind and water strakes outside the cargo length area. 4. Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table 5.7.4.4(1)②. 5. Side shell frames and brackets[2] complying with 5.7.1.1(5) of this Section	1. Suspect areas. 2. Within the cargo length: a) Each deck plate outside line of cargo hatch openings. b) Two transverse sections, one in the amidship area, outside line of cargo hatch opening. c) All wind and water strakes. 3. Selected wind and water strakes outside the cargo length area. 4. Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table 5.7.4.4(1)②. 5. The vertically corrugated transverse watertight bulkhead[1] between cargo holds Nos.1 and 2, if applicable. 6. Item 5 as for special survey No.2	1. Suspect areas. 2. Within the cargo length: a) Each deck plate outside line of cargo hatch openings. b) Three transverse sections, one in the amidship area, outside line of cargo hatch opening. c) Each bottom plate. 3. All wind and water strakes, full length. Points 4, 5 and 6 as for special survey No.3

Notes: 1 The specific requirements for the vertically corrugated transverse watertight bulkhead between cargo hold Nos.1 and 2 are given in Appendix 3 of this Chapter.
2 The requirements for thickness measurements of side shell frames and brackets complying with 5.7.1.1(5) of this Section are given in Appendix 6 of this Chapter.

Minimum Requirements for Thickness Measurements at Special Hull Survey of Double Skin Bulk Carriers **Table 5.7.4.5(1)②**

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15

		6. Representative exposed superstructure deck plating (poop, bridge, and forecastle deck)
		7. Lowest strake and centre strake in way of all transverse bulkheads in cargo spaces together with internals in way
		8. All wind- and water strakes, port and starboard, full length
		9. All keel plates full length. Also, additional bottom plates in way of cofferdams, machinery space, and aft end of tanks
		10. Plating of sea chests. Shell plating in way of overboard discharges as considered necessary by the attending Surveyor

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
(Special Survey of Bulk Carriers within the Cargo Area)
Bottom and Shell Structures **Table 5.7.4.5(2)①a**

Structural member	Extent of measurement	Pattern of measurement
1. Bottom and side shell plating	a) Suspect plate, plus four adjacent plates. b) See other tables for particulars on gauging in way of tanks and cargo holds	a) 5-point pattern for each panel between longitudinals
2. Bottoms/side shell longitudinals	Minimum of three longitudinals in way of suspect areas	3 measurements in line across web, 3 measurements on flange

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
(Special Survey of Bulk Carriers within the Cargo Area)
Transverse Bulkheads in Cargo Holds **Table 5.7.4.5(2)①b**

Structural member	Extent of measurement	Pattern of measurement
1. Lower stool	a) Transverse band within 25 mm of welded connection to inner bottom. b) Transverse band within 25 mm of welded connection to shelf plate	a) 5-point between stiffeners over 1 m length. b) 5-point between stiffeners over 1 m length
2. Transverse bulkhead	a) Transverse band at approximately mid height. b) Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)	a) 5-point pattern over 1 m^2 of plating. b) 5-point pattern over 1 m^2 of plating

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
(Special Survey of Bulk Carriers within the Cargo Area)
Deck Structure
(Including Cross Strips, Main Cargo Hatchways, Hatch Covers, Coamings and Topside Tanks)
Table 5.7.4.5(2)①c

Structural member	Extent of measurement	Pattern of measurement
1. Cross deck strip plating	Suspect cross deck strip plating	5-point pattern between underdeck stiffeners over 1 m length
2. Underdeck stiffeners	a) Transverse members; b) Longitudinal member	a) 5-point pattern at each end and mid span; b) 5-point pattern on both web and flange
3. Hatch covers	a) Side and end skirts, each 3 locations; b) 3 longitudinal bands, outboard strakes (2) and centerline strake (1)	a) 5-point pattern at each location; b) 5-point measurement each band
4. Hatch coamings	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	5-point measurement each band, i.e. end or side coaming
5. Topside water ballast tanks	a) Watertight transverse bulkheads: a. Lower 1/3 of bulkhead; b. Upper 2/3 of bulkhead; c. Stiffeners	a. 5-point pattern over 1 m^2 of plating; b. 5-point pattern over 1 m^2 of plating; c. 5-point pattern over 1 m length
	b) 2 representative swash transverse bulkheads: a. Lower 1/3 of bulkhead; b. Upper 2/3 of bulkhead; c. Stiffeners	a. 5-point pattern over 1 m^2 of plating; b. 5-point pattern over 1 m^2 of plating; c. 5-point pattern over 1 m length
	c) 3 representative bays of slope plating: a. Lower of 1/3 tank; b. Lower of 2/3 tank	a. 5-point pattern over 1 m^2 of plating; b. 5-point pattern over 1 m^2 of plating
	d) Longitudinals, suspect and adjacent	d) 5-point pattern on both web and flange over 1 m length
6. Main deck plating	Suspect plates and adjacent (4)	5-point pattern over 1 m^2 of plating
7. Main deck longitudinals	Minimum of 3 longitudinals where plating measured	5-point pattern on both web and flange over 1 m length
8. Web frames/transverses	Suspect plates	5-point pattern over 1 m^2

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion (Special Survey of Bulk Carriers within the Cargo Area)

Double Bottom and Hopper Structure **Table 5.7.4.5(2)①d**

Structural member	Extent of measurement	Pattern of measurement
1. Inner/double bottom plating	Suspect plate plus all adjacent plates	5-point pattern for each panel between longitudinals over 1 m length
2. Inner/double bottom longitudinals	Three longitudinals where plates measured	3 measurements in line across web and 3 measurements on flange
3. Longitudinal girders or transverse floors	Suspect plates	5-point pattern over about 1 m^2
4. Watertight bulkheads (WT floors)	a) Lower 1/3 of tank; b) Upper 2/3 of tank	a) 5-point pattern over 1 m^2 of plating; b) 5-point pattern alternate plates over 1 m^2 of plating
5. Web frames	Suspect plate	5-point pattern over 1 m^2 of plating
6. Bottoms/side shell longitudinals	Minimum of three longitudinals in way of suspect areas	3 measurements in line across web and 3 measurements on flange

Requirements for Extent of Thickness Measurement at Those Areas of Substantial Corrosion (Special Survey of Bulk Carriers within the Cargo Area)

Cargo Holds **Table 5.7.4.5(2)①e**

Structural member	Extent of measurement	Pattern of measurement
Side shell frames	Suspect frame and each adjacent	a) At each end and mid span: 5-point pattern of both web and flange; b) 5-point pattern within 25 mm of welded attachment to both shell and lower slope plate

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion of Double Skin Bulk Carriers within the Cargo Length Area

Bottom, Inner Bottom and Hopper Structure **Table 5.7.4.5(2)②a**

Structural member	Extent of measurement	Pattern of measurement
Bottom, inner bottom and hopper structure plating	Minimum of three bays across double bottom tank, including aft bay. Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
Bottom, inner bottom and hopper structure longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across flange and three measurements on the vertical web
Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements
Bottom floors, including the watertight ones	Three floors in the bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over two square metre area
Hopper structure web frame ring	Three floors in bays where bottom plating measured	5-point pattern over one square metre of plating; Single measurements on flange
Hopper structure transverse watertight bulkhead or swash bulkhead	Lower 1/3 of bulkhead	5-point pattern over one square metre of plating
	Upper 2/3 of bulkhead	5-point pattern over two square metre of plating
	Stiffeners (minimum of three)	For web, 5-point pattern over span (two measurements across web at each end and one at centre of span). For flange, single measurements at each end and centre of span
Panel stiffening	Where applicable	Single measurements

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion of Double Skin Bulk Carriers within the Cargo Length Area
Deck Structure
(Including Cross Strips, Main Cargo Hatchways, Hatch Covers, Coamings and Topside Tanks)

Table 5.7.4.5(2)②b

Structural member	Extent of measurement	Pattern of measurement
Cross deck strip plating	Suspect cross deck strip plating	5-point pattern between underdeck stiffeners over 1 metre length
Underdeck stiffeners	Transverse members	5-point pattern at each end and mid span
	Longitudinal members	5-point pattern on both web and flange
Hatch covers	Side and end skirts, each three locations. Three longitudinal bands, outboard strakes (2) and centerline strake (1)	5-point pattern at each location. 5-point measurement each band
Hatch coamings	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	5-point measurement each band, (i.e. end or side coaming
Topside ballast tanks	a) Watertight transverse bulkheads: − Lower 1/3 of bulkhead − Upper 2/3 of bulkhead − Stiffeners	 5-point pattern over 1 m^2 of plating. 5-point pattern over 1 m^2 of plating. 5-point pattern over 1 metre length
Topside ballast tanks	b) Two representative swash transverse bulkheads: − Lower 1/3 of bulkhead − Upper 2/3 of bulkhead − Stiffeners	 5-point pattern over 1 m^2 of plating. 5-point pattern over 1 m^2 of plating. 5-point pattern over 1 metre length
Topside ballast tanks	c) Three representative bays of slope plating: − Lower 1/3 of tank − Upper 2/3 of tank	 5-point pattern over 1 m^2 of plating. 5-point pattern over 1 m^2 of plating
Topside ballast tanks	d) Longitudinals, suspect and adjacent	5-point pattern on both web and flange over 1 metre length
Main deck plating	Suspect plates and adjacent (4)	5-point pattern over 1 m^2 of plating
Main deck longitudinals	Suspect plates	5-point pattern on both web and flange over 1 metre length
Web frames/transverses	Suspect plates	5-point pattern over 1 m^2

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion of Double Skin Bulk Carriers within the Cargo Length Area
Double Side Structure (Including Wing Void Spaces of Ore Carriers)

Table 5.7.4.5(2)②c

Structural member	Extent of measurement	Pattern of measurement
Side shell and inner plating: • Upper strake and strakes in way of horizontal girders. • All other strakes	• Plating between each pair of transverse frames/longitudinals in a minimum of three bays (along the tank). • Plating between every third pair of longitudinals in same three bays	• Single measurement • Single measurement
Side shell and inner side transverse frames/longitudinals on: • Upper strake. • All other strakes	• Each transverse frame/longitudinal in same three bays. • Every third transverse frame/longitudinal in same three bays	• Three measurements across web and 1 measurement on flange. • Three measurements across web and 1 measurement on flange
Transverse frames/longitudinals - brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of bracket
Vertical web and transverse bulkheads: • Strakes in a way of horizontal girders. • Other strakes	• Minimum of two webs and both transverse bulkheads. • Minimum of two webs and both transverse bulkheads	• 5-point pattern over approx. two square metre area. • Two measurements between each pair of vertical stiffeners
Horizontal girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
Panel stiffening	Where applicable	Single measurements

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion of Double Skin Bulk Carriers within the Cargo Length Area

Transverse Bulkheads in Cargo Holds **Table 5.7.4.5(2)②d**

Structural member	Extent of measurement	Pattern of measurement
Lower stool, where fitted	• Transverse band within 25 mm of welded connection to inner bottom. • Transverse band within 25 mm of welded connection to shelf plate	• 5-point pattern between stiffeners over one metre length. • 5-point pattern between stiffeners over one metre length
Transverse bulkheads	• Transverse band at approximately mid height. • Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)	• 5-point pattern over one square metre of plating. • 5-point pattern over one square metre of plating

5.7.4.6 Extent of tank testing

(1) All boundaries of water ballast tanks, deep tanks and cargo holds used for water ballast within the cargo length area are to be pressure tested. For fuel oil tanks, only representative tanks are to be pressure tested.

(2) The Surveyor may extend the tank testing as deemed necessary.

(3) Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.

(4) Boundaries of ballast holds are to be tested with a head of liquid to near to the top of hatches.

(5) Boundaries of fuel oil tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil tanks may be specially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results.

(6) The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

5.7.4.7 Automatic air pipe heads

(1) For examination of automatic air pipe heads installed on the exposed decks, reference is to be made to 5.4.4.2(18) of this Chapter.

5.7.4.8 Additional surveys are to be carried out for ships after determining compliance with SOLAS XII/12 and XII/13 as follows:

(1) For ships complying with the requirements of SOLAS XII/12 for hold, ballast and dry space water level detectors, the special survey is to include an examination and a test of the water ingress detection systems and of their alarms.

(2) For ships complying with the requirements of SOLAS XII/13 for the availability of pumping systems, the special survey is to include an examination and a test of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold, and of their controls.

Section 8 ADDITIONAL REQUIREMENTS FOR HULL AND EQUIPMENT SURVEYS OF CHEMICAL TANKERS

5.8.1 General requirements

5.8.1.1 This Section applies to all self-propelled chemical tankers fitted with integral tanks, i.e. ships with IMO certificate of fitness for the carriage of dangerous chemicals in bulk. If a chemical tanker is constructed with both integral and independent tanks, this Section is applicable only to that portion of the cargo length containing integral tanks. Combined gas carriers/chemical tankers with independent tanks within the hull, are to be surveyed as gas carriers.

5.8.1.2 This Section applies to surveys of hull structure and piping systems in way of cargo tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks. The requirements are additional to the classification requirements applicable to the remainder of the ship. The requirements are not applicable for independent tanks on deck.

5.8.1.3 This Section contains the minimum extent of examination, thickness measurements and tank testing. The survey is to be extended when substantial corrosion and/or structural defects are found and include additional close-up survey when necessary.

5.8.2 Annual surveys

5.8.2.1 General requirements
(1) The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition and should take into account the service history, condition and extent of the corrosion prevention system of ballast tanks and areas identified in the survey report file.
(2) The annual survey is to include the items specified in 5.8.2.2 through 5.8.2.5 of this Section and in addition, the applicable items specified in 5.4.2 of this Chapter.
5.8.2.2 Hull
(1) Examination of the hull plating and its closing appliances as far as can be seen.
(2) Examination of watertight penetrations as far as practicable.
5.8.2.3 Examination of weather decks
(1) Examination of cargo tank openings including gaskets, covers, coamings and flame screens.
(2) Examination of cargo tank pressure/vacuum valves and flame screens.
(3) Examination of flame screens on vents to all bunker tanks.
(4) Examination of cargo, bunker and vent piping systems, including vent masts and headers.
5.8.2.4 Examination of cargo pump rooms and pipe tunnels if fitted
(1) Examination of all pump room bulkheads for signs of chemical leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room bulkheads.
(2) Examination of the condition of all piping systems.
5.8.2.5 Examination of ballast tanks
(1) Examination of ballast tanks where required as a consequence of the results of the special survey (see 5.8.4) and intermediate survey (see 5.8.3.2) is to be carried out. When considered necessary by the Surveyor, or when extensive corrosion exists, thickness measurements are to be carried out and if the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Table 5.8.4.4(2). These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

5.8.3 Intermediate surveys
5.8.3.1 General requirements
(1) The intermediate survey extent is dependent on the age of the ship as specified in 5.8.3.2 to 5.8.3.4 of this Section.
(2) The intermediate survey is also to include the applicable items specified in 5.4.3 of this Chapter and 5.8.2 of this Section.
(3) For weather decks, an examination as far as applicable of cargo, bunker, ballast, steam and vent piping systems as well as vent masts and headers is to be carried out. If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, thickness measured or both.
5.8.3.2 Chemical tankers 5 to 10 years of age
(1) For ballast tanks, an overall survey of representative tanks selected by the Surveyor is to be carried out. If such inspections reveal no visible structural defects, the examination may be limited to a verification that the hard protective coating remains in GOOD condition.
(2) A ballast tank is to be examined at subsequent annual intervals where:
① a hard protective coating has not been applied from the time of construction, or
② a soft or semi-hard coating has been applied, or
③ substantial corrosion is found within the tank, or
④ the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.
(3) In addition to the requirements above, suspect areas identified at previous surveys are to be examined.
5.8.3.3 Chemical tankers 10 to 15 years of age
(1) The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 5.8.4 of this Section and 5.1.6.5. However, pressure testing of cargo and ballast tanks is not required unless deemed necessary by the attending Surveyor.
(2) In application of (1), the intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey in lieu of the application of 5.2.4.2.
(3) In application of (1), an underwater survey may be considered in lieu of the requirements of 5.8.4.1(4).
5.8.3.4 Chemical tankers over 15 years of age

(1) The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 5.8.4 of this Section and 5.1.6.5. However, pressure testing of cargo and ballast tanks is not required unless deemed necessary by the attending Surveyor.
(2) In application of (1), the intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey in lieu of the application of 5.2.4.2.
(3) In application of (1), a survey in dry dock is to be part of the intermediate survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks① are to be carried out in accordance with the applicable requirements for intermediate surveys, if not already performed.

5.8.4 Special surveys

5.8.4.1 General requirements

(1) The special survey is to include, in addition to the applicable requirements of 5.4.4 of this Chapter and 5.8.2 of this Section, examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in 5.8.4.1(3), is in a satisfactory condition and is fit for its intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.
(2) All cargo tanks, ballast tanks including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in 5.8.4.5 and 5.8.4.6, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.
(3) Cargo piping on deck and cargo and ballast piping within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are open during repair periods and can be examined internally.
(4) A survey in dry dock is to be a part of the special survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks① are to be carried out in accordance with the applicable requirements for special surveys, if not already performed.

5.8.4.2 Tank protection

(1) Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined. A ballast tank is to be examined at subsequent annual intervals where:

① a hard protective coating has not been applied from the time of construction, or
② a soft or semi-hard coating has been applied, or
③ substantial corrosion is found within the tank, or
④ the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

Thickness measurements are to be carried out as deemed necessary by the Surveyor.

5.8.4.3 Extent of overall and close-up surveys

(1) An overall survey of all tanks and spaces is to be carried out at each special survey. The survey of stainless steel tanks may be carried out as an overall survey supplemented by close-up survey as deemed necessary by the surveyor.
(2) The minimum requirements for close-up surveys at special survey of chemical tankers are given in Table 5.8.4.3(2)① and those of double skin chemical tankers in Table 5.8.4.3(2)②. For ships not having the notation ESP, the Surveyor may carry out the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system.

Minimum Requirements for Close-Up Surveys at Special Survey of Chemical Tankers

Table 5.8.4.3(2)①

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent Age > 15
A) One web frame ring (in a ballast wing tank)	A) All web frame rings (in a ballast wing tank or	A) All web frame rings (in all ballast tanks)	As special survey No.3

① Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

B) One deck transverse (in a cargo tank or on deck) D) One transverse bulkhead (lower part in a ballast tank) D) One transverse bulkhead (lower part in a cargo wing tank) D) One transverse bulkhead (lower part in a cargo centre tank) (see Note II)	double bottom ballast tank) (see Note I) B) One deck transverse (in each remaining ballast tank or on deck) B) One deck transverse (in a cargo wing tank or on deck) B) One deck transverse (in two cargo centre tanks or on deck) C) Both transverse bulkheads (in a ballast wing tank) D) One transverse bulkhead (lower part in each remaining ballast tank) D) One transverse bulkhead (lower part in two cargo centre tanks) (see Note II) D) One transverse bulkhead (lower part in a cargo wing tank)	A) All web frame rings (in a cargo wing tank) A) One web frame ring (in each remaining cargo tank) C) All transverse bulkheads (in all cargo tanks) C) All transverse bulkheads (in all ballast tanks)	Additional transverse areas as deemed necessary by CCS

Notes:

I: Ballast double hull tank means double bottom tank plus double side tank plus double deck tank, as applicable, even if these tanks are separate.

II: Where no centre cargo tanks are fitted (as in the case of centre longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

A to D are areas to be subjected to close-up surveys and thickness measurements (see Figures 5.8.4.3(2)a and 5.8.4.3(2)b).

A): Complete transverse web frame ring, including adjacent structural members.

B): Deck transverse, including adjacent deck structural members.

C): Transverse bulkhead complete, including girder system and adjacent structural members.

D): Transverse bulkhead lower part, including girder system and adjacent structural members.

Minimum Requirements for Close-Up Surveys at Special Survey of Double Skin Chemical Tankers

Table 5.8.4.3(2)②

Special Survey No.1 Age ≤ 5	Special Survey No.2 5 < Age ≤ 10	Special Survey No.3 10 < Age ≤ 15	Special Survey No.4 and Subsequent: Age > 15
(1) One web frame ring (in a ballast double hull tank) (see Note I) (2) One deck transverse (in a cargo tank or on deck) (4) One transverse bulkhead (in a ballast tank) (see Note I) (5) One transverse bulkhead (in a cargo wing tank) (5) One transverse bulkhead (in a cargo centre tank) (see Note II)	(1) All web frame rings (in a ballast wing tank or ballast double hull tank) (see Note I) (6) The knuckle area and the upper part (3 metres approx) of one web frame in each remaining ballast tank (2) One deck transverse (in two cargo tanks) (4) One transverse bulkhead (in each ballast tank) (see Note I) (5) One transverse bulkhead (in two cargo centre tanks) (see Note II) (5) One transverse bulkhead (in a cargo wing tank)	(1) All web frame rings (in all ballast tanks) (7) All web frame rings (in a cargo wing tank) (7) One web frame ring (in each remaining cargo tank) (3) All transverse bulkheads (in all cargo tanks) (4) All transverse bulkheads (in all ballast tanks)	As special survey No.3 Additional transverse areas as deemed necessary by CCS

(1), (2), (3), (4), (5), (6) and (7) are areas to be subjected to close-up surveys and thickness measurements (see Figures 5.8.4.3(2)②a to c).

(1): Web frame in a ballast tank means vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in double deck tank (where fitted), including adjacent structural members. In fore and aft peak ballast tanks web frame means a complete transverse web frame ring including adjacent structural members.

(2): Deck transverse, including adjacent deck structural members (or external structure on deck in way of the tank, where

applicable).

(3): Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower and upper stools, where fitted.

(4): Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members, such as longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets.

(5): Transverse bulkhead lower part in cargo tank, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower stool, where fitted.

(6): The knuckle area and the upper part (3 metres approximately), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the slope hopper plating to the inner hull bulkhead and the inner bottom plating, up to 2 metres from the corners both on the bulkhead and the double bottom.

(7): Web frame in a cargo tank means deck transverse, longitudinal bulkhead structural elements and cross ties, where fitted, including adjacent structural members.

Note I: Ballast double hull tank means double bottom tank plus double side tank plus double deck tank, as applicable, even if these tanks are separate.

Note II: Where no centre cargo tanks are fitted (as in the case of centre longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

Representative Transverse Section of Chemical Tanker. Areas 6 & 7

(3) The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

① in particular, tanks having structural arrangements or details which have suffered defects in similar tanks or on similar ships according to available information;

② in tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

(4) For areas in tanks where hard protective coatings are found to be in a GOOD condition**,** the extent of

close-up surveys according to Table 5.8.4.3(2) may be specially considered.

5.8.4.4 Extent of thickness measurement

(1) The minimum requirements for thickness measurements at special survey are given in Table 5.8.4.4(1)a. Thickness measurement of stainless steel hull structure and piping may be waived, except for clad steel plating. For ships not having the notation ESP, the minimum requirements for thickness measurements are given in Table 5.8.4.4(1)b.

(2) Provisions for extended measurements for areas with substantial corrosion are given in Table 5.8.4.4(2)a to d, and as may be additionally specified in the survey programme as required by 5.1.6.5. For ships not having the notation ESP, provisions for extended measurements for areas with substantial corrosion are given in Table 5.4.4.2(17)②. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous special surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

Minimum Requirements for Thickness Measurements at Special Survey of Chemical Tankers

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
(Special Survey of Chemical Tankers within the Cargo Area Length)
Bottom, Inner Bottom and Hopper Structure Table 5.8.4.4(2)a

Structural member	Extent of measurement	Pattern of measurement
1. Bottom, inner bottom and hopper structure plating	Minimum of three bays across tank, including aft bay Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
2. Bottom, inner bottom and hopper structure longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across the flange and three measurements on vertical web
3. Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across face flat where fitted
4. Bottom floors, including the watertight ones	Three floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over two square metre area
5. Hopper structure web frame ring	Three floors in bays where bottom plating measured	5-point pattern over one square metre of plating. Single measurements on flange
6. Hopper structure transverse watertight bulkhead or swash bulkhead	– lower 1/3 of bulkhead	– 5-point pattern over one square metre of plating
	– upper 2/3 of bulkhead	– 5-point pattern over two square metre of plating
	– stiffeners (minimum of three)	– For web, 5-point pattern over span (two measurements across web at each end and one at centre of span). For flange, single measurements at each end and centre of span
7. Panel stiffening	Where applicable	Single measurements

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
(Special Survey of Chemical Tankers within the Cargo Area Length)
Deck Structure Table 5.8.4.4(2)b

Structural member	Extent of measurement	Pattern of measurement
1. Deck plating	Two transverse bands across tank	Minimum of three measurements per plate per band
2. Deck longitudinals	Every third longitudinal in each of two bands with a minimum of one longitudinal	Three measurements in line vertically on webs and two measurements on flange (if fitted)
3. Deck girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across flange. 5-point pattern on girder/bulkhead brackets
4. Deck transverse webs	Minimum of two webs, with measurements at both ends and middle of span	5-point pattern over one square metre area. Single measurements on flange
5. Vertical web and transverse bulkhead in wing ballast tank for double hull design (two metres from deck)	Minimum of two webs, and both transverse bulkheads	5-point pattern over one square metre area
6. Panel stiffening	Where applicable	Single measurements

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion
(Special Survey of Chemical Tankers within the Cargo Area Length)
Side Shell and Longitudinal Bulkheads Table 5.8.4.4(2)c

Structural member	Extent of measurement	Pattern of measurement
1. Side shell and longitudinal bulkhead plating: – Deckhead and bottom strakes, and strakes in way of horizontal girders – All other strakes	– Plating between each pair of longitudinals in a minimum of three bays (along the tank) – Plating between every third pair of longitudinals in same three bays	Single measurement
2. Side shell and longitudinal bulkhead longitudinals on: – Deckhead and bottom strakes – All other strakes	– Each longitudinal in same three bays – Every third longitudinal in same three bays	3 measurements across web and 1 measurement on flange
3. Longitudinals - brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of bracket
4. Vertical web and transverse bulkheads of double side tanks (excluding deck area): – Strakes in way of horizontal girders – Other strakes	– Minimum of two webs and both transverse bulkheads – Minimum of two webs and both transverse bulkheads	– 5-point pattern over approx. two square metre area – Two measurements between each pair of vertical stiffeners
5. Web frames and cross ties for other tanks than double side tanks	Three webs with minimum of three locations on each web, including in way of cross tie connections and lower end bracket	5-point pattern over approximately two square metre area of webs, plus single measurements on flanges of web frame and cross ties
6. Horizontal girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
7. Panel stiffening	Where applicable	Single measurements

Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion

(Special Survey of Chemical Tankers within the Cargo Area Length)

Transverse Watertight and Swash Bulkheads Table 5.8.4.4(2)d

Structural member	Extent of measurement	Pattern of measurement
1. Upper and lower stool, where fitted	– Transverse band within 25 mm of welded connection to inner bottom/deck plating – Transverse band within 25 mm of welded connection to shelf plate	5-point pattern between stiffeners over one metre length
2. Deckhead and bottom strakes, and strakes in way of horizontal stringers	Plating between pair of stiffeners at three locations: approximately 1/4, 1/2 and 3/4 width of tank	5-point pattern between stiffeners over one metre length
3. All other strakes	Plating between pair of stiffeners at middle location	Single measurement
4. Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5-point pattern over about one square metre of plating
5. Stiffeners	Minimum of three typical stiffeners	For web, 5-point pattern over span between bracket connections (two measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
6. Brackets	Minimum of three at top, middle and bottom of tank	5-point pattern over area of bracket
7. Horizontal stringers	All stringers with measurements at both ends and middle	5-point pattern over one square metre area, plus single measurements near bracket toes and on flanges
8. Deep webs and girders	Measurements at toe of bracket and at centre of span	For web, 5 point pattern over about 1 square metre. 3 measurements across face flat

(3) The Surveyor may further extend the thickness measurements as deemed necessary.

(4) For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurements according to Table 5.8.4.4(1) may be specially considered.

(5) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

(6) In cases where two or three sections are to be measured, at least one is to include a ballast tank within

0.5*L* amidships.
(7) Thickness measurements may be carried out at the commencement of the special survey, or the thickness measurement report prepared within 15 months before the due date of the special survey may be taken as the thickness measurement report of the special survey.
(8) For the assessment of thickness measurement results, see 5.4.4.2(17)⑤ of this Chapter.

5.8.4.5 Extent of tank testing

(1) The minimum requirements for ballast tank testing are given in (3) of this paragraph and Table 5.8.4.5(1); the minimum requirements for cargo tank testing are given in (4) of this paragraph and Table 5.8.4.5(1). Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the Surveyor provided the following conditions are complied with:

① a tank testing procedure, specifying fill heights, tanks being filled and bulkheads being tested, has been submitted by the Owner and reviewed by CCS prior to the testing being carried out;

② there is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;

③ the tank testing has been satisfactorily carried out within a special survey window not more than 3 months prior to the date of the survey on which the overall or close-up survey is completed;

④ the satisfactory results of the testing is recorded in the ship's logbook;

⑤ the internal and external condition of the tanks and associated structure are found satisfactory by the Surveyor at the time of the overall and close-up survey.

(2) The Surveyor may extend the tank testing as deemed necessary.
(3) Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.
(4) Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.
(5) The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

Minimum Requirements to Tank Testing at Special Survey of Chemical Tankers

Table 5.8.4.5(1)

Special Survey No.1 Age ≤ 5	Special Survey No.2 and Subsequent Age > 5
1. All ballast tank boundaries. 2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	1. All ballast tank boundaries. 2. All cargo tank bulkheads

5.8.4.6 Chemical tankers over 10 years of age

(1) Selected steel cargo pipes outside cargo tanks and ballast pipes passing through cargo tanks are to be:

① thickness measured at random or selected pipe lengths to be opened for internal inspection;

② pressure tested to the maximum working pressure.

Special attention is to be given to cargo/slop discharge piping through ballast tanks and void spaces.

Section 9 SURVEYS OF MACHINERY

5.9.1 General requirements

5.9.1.1 This Section applies to surveys of machinery installations for all self-propelled ships. However, boilers and thermal oil heaters, screwshaft and tubeshaft as well as the machineries covered by Section 11 of this Chapter and PART FIVE of the Rules are excluded.

5.9.1.2 The purpose of surveys for machinery is to confirm that machinery installations are properly maintained, in good and effective condition and fit for their intended purposes. Surveys for machinery are normally to be carried out in conjunction with corresponding hull surveys.

5.9.1.3 The owner and manager of the ship are to make appropriate preparations for different types of surveys in advance, including cleaning and illumination of spaces, providing safe access to survey items, safety facilities, and sufficient information, instructions, diagrams and lists as necessary.

5.9.1.4 Special consideration may be given in application of relevant requirements of this Section to commercial ships owned or chartered by Governments, which are utilized in support of military operations or service.

5.9.1.5 Surveys of machinery may be carried out on a PMS basis (Reference to Appendix 16 of this

Chapter).
5.9.1.6 Surveys of machinery may be carried out on a CM / CBM basis (Reference to Appendix 22 of this Chapter).

5.9.2 Annual surveys

5.9.2.1 The relevant requirements for interval of annual surveys are given in Section 2 of this Chapter.
5.9.2.2 The purpose of annual surveys is to confirm that the general condition of machinery installations in question is properly maintained since last survey and is fit for their intended purposes.
5.9.2.3 Survey items for all ships
(1) Confirming that the machinery, boilers and other pressure vessels, associated piping systems and fittings are installed and protected so as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.
(2) Confirming that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.
(3) Confirming that means are provided so that the machinery can be brought into operation from the dead ship condition without external aid.
(4) Carrying out a general examination of the machinery, the boilers, all steam, hydraulic, pneumatic and other systems and their associated fittings to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.
(5) Examining and testing the operation of main and auxiliary steering arrangements, including their associated equipment and control systems.
(6) Confirming that the various alarms required for hydraulic power-operated, electric and electro-hydraulic steering gears are operating satisfactorily and that the re-charging arrangements for hydraulic power-operated steering gears are being maintained.
(7) Examining the means for the operation of the main and auxiliary machinery essential for the propulsion and the safety of the ship, including, when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge (including the control, monitoring, reporting, alert and safety actions) and the arrangements to operate the main and other machinery from a machinery control room.
(8) Confirming the operation of the ventilation for the machinery spaces.
(9) Examining the arrangements for periodically unattended machinery spaces and, in particular, the random testing of alarm, automatic and shutdown functions.
(10) Confirming, as far as practicable, that no changes have been made in the structural fire protection, examining any manual and automatic fire doors and proving their operation, testing the fire dampers of ventilation ducts and the means of closing the main inlets and outlets of all ventilation systems and testing the means of stopping power ventilation systems from outside the space served.
(11) Confirming that the means of escape from accommodation, machinery and other spaces are satisfactory.
(12) Examining visually the condition of any expansion joints in seawater systems.
(13) Confirming that no unapproved changes have been made to the structures of machinery spaces and boiler spaces.
(14) Confirming that doors in machinery spaces and boiler spaces are in a good working condition, and escape routes are free from obstruction.
(15) Confirming that maintenance of main propulsion plant including main propulsion machinery, gear units and shafting systems is in accordance with the Rules and that they are in a good working condition.
(16) Confirming that pump and piping systems associated with the main propulsion system are maintained in a good working condition.
(17) Confirming that generator prime mover and other auxiliary machinery and associated pump and piping systems are in a good working condition.
(18) Confirming that essential safety and protective devices including safety valves of boilers, exhaust boilers, economizers, steam heated steam generators, boilers used not for propulsion services having a working pressure exceeding 0.35 MPa and a heating surface exceeding 4.5 m^2, thermal oil and hot water units, relief valves of pressure vessels having a working pressure exceeding 0.7 MPa, safety devices and emergency cut-off devices for oil supply and burning units, etc. are in a good working condition, and that safety means for all moving parts and hot surfaces are in a good working condition and effective.
(19) Examining the bilge pumping systems and bilge wells, including operation of pumps, extended spindles and level alarms, in machinery spaces and boiler spaces as far as practicable; operational testing of emergency bilge pumping systems in machinery spaces of passenger ships for confirming their good working condition.
(20) Confirming that initial starter is effective.

(21) Confirming that the means of communication between the navigation bridge and machinery spaces, steering gear compartment and where fitted, emergency steering positions are operating satisfactorily.
(22) Confirming that voyage repairs made by crew are satisfactory.
(23) Confirming that recommendations and remaining items from previous surveys have been dealt with in accordance with related requirements.

5.9.2.4 Additional items for oil tankers

(1) In addition to 5.9.2.3, the following items are also to be examined:

① confirming that no potential sources of ignition such as loose gear, excessive products in the bilges, excessive vapours, combustible materials, etc., are present in the cargo pump room and that access ladders are in good condition;
② confirming that cargo pump rooms and all pump room bulkheads have no signs of leakage and, in particular, paying attention to the sealing arrangements of all penetrations in these bulkheads;
③ confirming that ventilation system of cargo pump rooms and pump rooms including ducting, dampers and flame screens and their control devices outside cargo pump rooms and pump rooms are in good condition;
④ examination of all piping systems in cargo pump rooms and pump rooms, in so far as practicable and confirming that they are in good condition;
⑤ confirming in so far as practicable, that shaft glands of cargo, bilge, ballast and stripping pumps, and remote operating and shutoff devices of cargo pump room bilge system are in good condition, and checking that the pump foundations are intact;
⑥ confirming that the fixed fire-fighting system for the cargo pump room is in good condition and that all openings are capable of being closed quickly from outside;
⑦ confirming that fixed deck foam system is in good condition.

5.9.2.5 Additional survey requirements for ships having inert gas system notation (IGS)

(1) For ships having an inert gas system (IGS), an examination and/or test of the following items is to be carried out to confirm that the system is in a good working condition:

① visual examination of all piping and venting pipes on decks and discharges in the shell plating in cargo areas to confirm that there is no any sign of gas or effluent leakage;
② confirming the proper operation of both inert gas blowers;
③ confirming the proper operation of the scrubber-room ventilation system;
④ checking the deck water seal for automatic filling and draining, and the arrangements for protecting the system against freezing;
⑤ where a double block and bleed valve is installed, checking the automatic operations of the block and the bleed valves upon loss of power;
⑥ where two shut-off valves in series with a venting valve in between are used as non-return devices, checking the automatic operation of the venting valve, and the alarm for faulty operation of the valves;
⑦ examining the operation of all remotely operated or automatically controlled valves and, in particular, the flue gas isolating valves;
⑧ observing a test of the interlocking feature of soot blowers;
⑨ observing that the gas pressure regulating valve automatically closes when the inert gas blowers are secured;
⑩ checking the means for separating the cargo tank not being inerted from the inert gas main;
⑪ checking the alarms of the two oxygen sensors positioned in the space or spaces containing the inert gas system;
⑫ checking/testing, as far as practicable, the following alarms and safety devices of the inert gas system using simulated conditions where necessary:
   a. high oxygen content of gas in the inert gas main;
   b. low gas pressure in the inert gas main;
   c. low pressure in the supply to the deck water seal;
   d. high temperature of gas in the inert gas main;
   e. low water pressure or low water-flow rate;
   f. accuracy of portable and fixed oxygen-measuring equipment by means of calibration gas;
   g. high water level in the scrubber;
   h. failure of the inert gas blowers;
   i. failure of the power supply to the automatic control system for the gas regulating valve and to the

instrumentation of continuous indication and permanent recording of pressure and oxygen content in the inert gas main;

j. high pressure of gas in the inert gas main;

⑬ checking the proper operation of the inert gas system.

5.9.2.6 Additional survey requirements for ships having class notations of machinery control and automation

(1) For ships having class notations of machinery control and automation, a general examination or performance test of the following items is to be carried out, in so far as practicable, to confirm that they are in a good working condition:

① function test of alarm indicators;

② checking functions of control systems of main and auxiliary engines:

a. automatic control of main engines;

b. automatic control of main and auxiliary boilers;

c. automatic start and control of emergency generators;

d. automatic start or change-over of standby pumps for essential pumps serving main engines;

e. performance test of engine room bilge level detection and alarm system and of start of pumps;

③ communication and extended alarm between the navigating bridge and engineers' accommodation;

④ checking functions of fixed fire detection and fire alarm systems;

⑤ performance test of repaired items of automatic and remote control systems of other essential machineries;

⑥ examining the machinery records to check the performance of the control system throughout the period since the last survey and to establish if there has been any abnormal functioning or failures and what corrective measures had been taken to preclude their recurrence.

5.9.2.7 For ships having class notations for other machinery installations, e.g. SCM, ECM, a general survey is to be carried out in accordance with respective requirements in the Rules to confirm that such installations are in good working condition and effective.

5.9.2.8 Examining, where applicable, the alternative design and arrangements for machinery or electrical installations, low-flashpoint fuel storage and distribution systems, or fire safety, in accordance with the test, inspection and maintenance requirements, if any, specified in the approved documentation.

5.9.3 Intermediate surveys

5.9.3.1 The relevant requirements for interval of intermediate surveys are given in Section 2 of this Chapter.

5.9.3.2 Survey items for all ships

(1) In addition to the applicable requirements for annual surveys, the following items are to be added:

① prime movers of driving generators are to be operationally tested under working conditions to verify that they are in a good working condition;

② sea chests and overboard discharge valves in machinery and boiler spaces are to be inspected;

③ a general examination of windlass and a partial load test by slipping and hauling anchors are to be carried out.

5.9.4 Special surveys

5.9.4.1 The relevant requirements for interval of special surveys are given in Section 2 of this Chapter.

5.9.4.2 Conditions for survey

(1) The owner is to provide the necessary conditions and safety facilities for the survey, e.g. disassembling or opening and cleaning, safe access to and illumination for survey items.

(2) Special surveys are to include examinations, tests, and checks of sufficient extent to ensure that the machinery installations are properly maintained and are fit for the intended purpose for the new period of class of 5 years.

5.9.4.3 Survey and test items for all ships

(1) The items in 5.9.3.2 of this Chapter applicable to the ship.

(2) The items in 5.11.2.1 of this Chapter applicable to the ship. However, a docking survey is considered to coincide with the special survey when carried out within 15 months prior to the due date of the special survey.

(3) All shafts (excluding screwshaft, tubeshaft, directional propeller and water jet propulsion arrangements) and bearings of the main propulsion system are to be examined. The lower half of the bearings need not be exposed if alignment and wear are found in order.

(4) All gear units are to be opened up and their pinions and wheels, shafts, bearings, thrust bearings and

lubricating system examined. Conventional gear units 1,120 kW and below and all epicyclic gear units need not be opened up provided that satisfactory operating records are provided by the owner.
(5) Auxiliary engines including air compressors, filters, oily water separator, intercoolers and safety devices are to be examined.
(6) All pumps and associated parts serving the propulsion machinery are to be opened up and examined.
(7) Steering arrangements together with the main and auxiliary steering gears are to be examined, and a hydrostatic check of the steering system to the relief valve setting is to be conducted.
(8) Examination of anchor windlass, including operational check, check of the brake and foundation, and testing of safety devices.
(9) Foundation bolts and gaskets of main and auxiliary engines, gearboxes as well as thruster and intermediate shaft pedestals are to be examined.
(10) All heat exchangers (including intercoolers) and pressure vessels with working pressures of 0.7 MPa and over together with associated attachments and valves are to be opened up and examined and where corrosion or damage is found, pressure tested to determine the working pressure. Their relief valves are to be checked in service conditions. Where it is difficult to open up certain small heat exchangers or pressure vessels with working pressures of 0.7 MPa and over, an alternative hydraulic test to 1.25 times the working pressure may be accepted.
(11) Valves, cocks and strainers of bilge system together with pipelines are to be tested in service conditions.
(12) Connection and blanking arrangements of fuel oil, lubricating oil, cooling water, feed water and ballast systems are to be examined or tested and if necessary opened up for examination.
(13) Fuel oil tanks constructed not forming part of hull structure are to be examined and if deemed necessary by the Surveyor, to be pressure tested. If fuel oil tanks are found satisfactory during the external examination, the internal examination of such tanks may be exempted for ships less than 10 years of age.

5.9.4.4 Additional survey requirements for ships having class notations of machinery control and automation

(1) In addition to 5.9.2.7, a general examination of the following items is to be carried out to confirm that they are in a good working condition.

① Simulated performance test of automated system of main propulsion machinery:
   a. main control system (including automatic control of start, operation, stopping and reversing of main propulsion machinery, remote control of engine room centralized control room and navigating bridge);
   b. control system changeover and communication;
   c. safety system;
   d. alarm system;
   e. overriding control system;
   f. automatic start of standby machinery;
   g. confirming changeover to manual control in case of failure of remote control system;
   h. function test of control, safety and alarm systems when power (electrical, hydraulic or pneumatic) is restored after a power failure.

② Simulated performance test of automated system of boilers:
   a. safety system for burning (including automatically stopping fuel supply pump, automatically starting and stopping feed pump, scavenging, automatically controlling temperature);
   b. monitoring and alarm systems;
   c. manual control.

③ Automatic controls and alarms of generating system and power plant (including automatic start, switch-in, parallel operation, load distribution and shutoff of standby generating sets) are to be examined.

④ Simulated performance test of other essential machinery:
   a. performance test of control, safety and alarm systems (including alarm indicators, displays) are to be carried out so far as is practicable;
   b. components (elements, valves, actuators, instruments) of automatic and remote control systems are to be visually examined and if necessary, opened up for examination and test.

⑤ Remote operation test of suction valves and discharge valves below waterline.

⑥ Checking records of fault recorder and reviewing log book entries regarding automatic and remote control equipment to confirm operational reliability of all systems.

5.9.4.5 Additional survey requirements for ships having the class notation of inert gas system (IGS)

(1) For ships having the class notation of inert gas system (IGS), the following items are to be examined

and/or tested to confirm that they are in a good working condition:

① inert gas generator and scrubber are to be opened up if there is any sign of gas or effluent leakage;

② inert gas piping and stop valve together with interlocking feature of soot blowers are to be disassembled and examined if there is any abnormality;

③ deck water seal and non-return valve are to be opened up;

④ water cooling system including discharge pipe and scrubber overboard discharge pipe are to be examined, and valves are to be disassembled and examined;

⑤ function test of all automatic closing appliances and alarm systems;

⑥ examining the integrity of the system under working condition;

⑦ at the request of the owner and upon approval by CCS, a system of continuous surveys may be undertaken whereby the special survey requirements are carried out in regular rotation, i.e. every mechanical item of the inert gas system is to be opened up and examined, so far as practicable, at the specified interval (normally five (5) years). The interval between consecutive examinations of each item is not to exceed five (5) years. Surveys are to be arranged annually for about a fifth of all items. If any defect is found during the survey, related components and parts are to be opened up and examined. Such defects are to be dealt with to the satisfaction of the Surveyor;

⑧ examining the whole system under working condition.

5.9.4.6 Diesel engines

(1) For diesel engines, the following parts (if fitted) are to be disassembled/opened up for examination.

① Cylinder liners, cylinder covers, valves and their transmitting gear, pistons, piston rods, crossheads, guides, connecting rods, crankshaft and all bearings, crankcases, bedplates, frames and entablatures, crankcase door fastenings and explosion relief devices, scavenger relief devices, scavenging pump or blowers, superchargers and their associated coolers, fuel pumps and fittings, camshafts and their transmitting gear together with balance weights, torsional vibration dampers or detuners, flexible couplings, clutches, reverse gears, attached pumps and cooling arrangements.

② Selected portion of pipes in the starting air system is to be removed for internal examination and acoustic test. If lube oil accumulation is found, in addition to steam blowing, the portions of pipes adjacent to main starting valve and air discharge from compressor are to be removed for examination.

③ Test of engine operation and test of initial starting arrangement.

④ The survey of diesel engines with bores 300 mm or below may be carried out according to the manufacturer’s scheduled maintenance program, provided the engines are maintained under the program. The records of the program, including lubrication servicing, are to be made available to the Surveyor. Periodical overhauls, required by the manufacturer’s scheduled maintenance program, are to be witnessed by the Surveyor.

5.9.4.7 Gas turbines

(1) For gas turbines, the following parts are to be opened out for examination.

① Impellers or blading, rotors and casings of the air compressors, combustion chambers, intercoolers, gas and air piping, starting and reversing arrangements.

② Gas turbines may be opened and maintained in accordance with the manufacturer’s recommendations. The owner is to submit for approval maintenance schedules for each type of gas turbine in service, specifying proposed intervals for combustion checks, hot-gas-path examinations and other items.

③ For units in continuous service, at least one hot-gas-path examination is to be scheduled each survey period (normally five (5) years) and is to include an examination of turbine rotors, fixed blading (nozzle ring), combustors, inlet casings, exhaust casing, air control valves and protective apparatus. Other parts and associated equipment, if any obvious change has been made to them as shown in comparison with previous records available, are to be opened up for examination.

④ Opening of compressor sections is to be scheduled in conjunction with other items, provided that examination of the blades visible from the inlet plenum during the hot-gas-path examination reveals no evidence of defects.

⑤ The required examinations of auxiliary gas turbine units, at least once each period (normally five years), are to be based on manufacturer's recommendations, as appropriate for the actual operating hours and conditions, together with an operation test including protective apparatus.

⑥ Where units are arranged such that the unit is removed from the ship and dismantled at another facility, the internal examination may be carried out at the facility. The reinstallation is to be carried out to the satisfaction of the Surveyor.

⑦ Upon reassembly/reinstallation, all fuel lines, lube oil piping, the unit itself and exhaust system are to be checked under full speed operational conditions for leakage. All shielding and fuel oil double wall piping is to be examined.

⑧ Cylinders, pistons, end covers, valves and valve gear, pumps and fittings, synchronizing and control gear, cooling system, explosion relief devices including bypass arrangements of free piston gas generators are to be opened out and examined.

⑨ Air compressors including rotors and casings, combustion chambers, burners, intercoolers, heat exchangers, gas and air piping of gas turbines are to be opened out and examined.

5.9.4.8 Steam turbines

(1) For main and auxiliary steam turbines, the following parts are to be opened out for examination.

① Rotor with blading and shrouding and bearings.

② Nozzles, stationary blading, interstage packing and gland seals with oil barriers.

③ Bleed controls and foundation expansion arrangements.

④ Throttle valves are to be operationally tested and opened as deemed necessary.

⑤ In general, lifting of the main propulsion turbine casing may be waived for new-installed ones within the 5-years period of the special survey No.1, provided the turbines are of a well known type and fitted with rotor position indicators and vibration indicators of an approved type, as well as steam pressure measuring equipment at appropriate locations in the steam flow path. Rotor bearings, thrust bearings and the flexible coupling are to be opened and examined. The low pressure turbine exhaust trunk is to be opened for examination of the last row of low pressure and astern wheels. Turbine operating records are to be reviewed. The arrangements for changeover in case of emergency operation of the plant are to be readily available. The turbines are to be operationally tested.

⑥ Turbine casings are to be lifted for confirming the effectiveness of the maintenance arrangement at special survey No.2 and subsequent special surveys. However, the lifting of main propulsion turbine casings may be waived at special survey No.3 and subsequent special surveys, provided that:

a. an approved preventative maintenance arrangement has been established, including vibration monitoring, lubricating oil analysis and rotor position checks;
b. the rotor journal bearings, thrust bearings and flexible couplings are opened up for examination, the low-pressure turbine exhaust trunk is opened for examination of the last row of low pressure and astern wheels;
c. the turbine operating records are reviewed and all considered satisfactory by the Surveyor, at least in compliance with the manufacturer's recommendations;
d. the turbines are to be operationally tested.

5.9.4.9 As part of the Special Survey of Machinery, a dock trial is to be carried out to attending Surveyors' satisfaction to confirm satisfactory operation of main and auxiliary machinery. If significant repairs are carried out to main or auxiliary machinery or steering gear, consideration should be given to a sea trial to attending Surveyors' satisfaction.

5.9.4.10 If the significant repairs as stated in 5.9.4.9, is considered by CCS to have any impact on response characteristics of the propulsion systems, then the scope of sea trial is also to include a test plan for astern response characteristics based on those required for such an equipment or systems when fitted to the new ship. Refer to 1.2.4, Chapter 1, PART THREE of the Rules for astern testing requirements.

The tests are to demonstrate the satisfactory operation of the equipment or system under realistic service conditions at least over the manoeuvring range of the propulsion plant, for both ahead and astern directions. Depending on the actual extent of the repair, CCS may accept a reduction of the test plan.

Section 10 SURVEYS OF ELECTRICAL INSTALLATIONS

5.10.1 General requirements

5.10.1.1 This Section applies to surveys of electrical installations for all ships.

5.10.2 Annual surveys

5.10.2.1 The relevant requirements for interval of annual surveys are given in Section 2 of this Chapter.

5.10.2.2 Survey items

(1) Confirming that means of communication between the navigation bridge and steering gear compartment and the means of indicating the angular position of the rudder are operating satisfactorily.

(2) Confirming that with ships having emergency steering position there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering position;
(3) Confirming that the engine room telegraph, the second means of communication between the navigation bridge and the machinery spaces and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.
(4) Confirming that the engineer's alarm is clearly audible in the engineer's accommodation.
(5) Examining, as far as practicable, visually and in operation, the electrical installations, including the main source of power, main and emergency lighting systems and cables.
(6) Satisfactory operation of main power source, emergency power source including its starting device and emergency power supply of the equipment essential to ship safety is to be tested. Where these power sources are provided with automatic power supply, the test is to be carried out in automatic mode.
(7) Examining, in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained, e.g. bonding straps for the control of static electricity and earthing arrangements are to be examined where fitted.
(8) Electric propulsion plant, position-keeping mooring and auxiliary propulsion plant as well as controls are to be tested.
(9) Confirming that generators, motors driving essential machineries together with controls are in normal working condition.
(10) Failure indicators and alarms associated with electrical equipment essential to safety of ship are to be examined and tested.
(11) Confirming voyage repairs made by crew.
(12) Confirming that no potential sources of fire exist in dangerous spaces, and that all electrical equipment in dangerous zones is suitable for such locations, is in good condition and is being properly maintained.
(13) For oil tankers, electrical installations, cables, controls, explosion-proof equipment and appliances in cargo oil pump rooms and spaces above and adjacent to cargo area are to be examined to verify that there are no improperly installed or unapproved equipment and dead end wiring, etc.
(14) Where the electrical distribution system on board a ship includes harmonic filters, the total harmonic distortion (THD) recorded onboard the ship is to be checked.
(15) Checking the schedule of batteries used for essential and emergency services, confirming that relevant records have been updated after replacement of batteries.

5.10.3 Intermediate surveys

5.10.3.1 The relevant requirements for interval of intermediate surveys are given in Section 2 of this Chapter.

5.10.3.2 Survey items

(1) The items in 5.10.2.2 of this Section applicable to the ship.
(2) Generators are to be operationally tested under working conditions to verify that they are in a good working condition.
(3) Electrical equipment in dangerous zones or circuits passing through dangerous zones are to be examined to verify that there are no dangers, defects, improperly installed or unapproved equipment and dead end wiring, etc.
(4) Insulation resistance of electrical circuits in dangerous zones (such as cargo pump rooms and spaces adjacent to cargo tanks) is to be tested, but in cases where a proper record of testing is maintained, consideration should be given to accepting recent readings.

5.10.4 Special surveys

5.10.4.1 The relevant requirements for interval of special surveys are given in Section 2 of this Chapter.

5.10.4.2 Conditions for survey: The owner is to provide the necessary conditions and safety facilities for the survey, e.g. disassembling or opening and cleaning, safe access to and illumination for survey items.

5.10.4.3 Survey and test items

(1) The items in 5.10.3.2 of this Section applicable to the ship.
(2) The items in 5.11.2.1 of this Chapter applicable to the ship. However, a docking survey is considered to coincide with the special survey when carried out within 15 months prior to the due date of the special survey.
(3) Insulation resistance of electrical equipment and circuits are to be tested.
(4) The fittings on the main and emergency switchboard, section boards and distribution boards are to be examined and over-current protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits.
(5) Air circuit breakers of generators are to be tested to verify satisfactory operation and delay of protective

devices.
(6) All cables are to be examined to verify that there are no loosening clamps and casings.
(7) Motors and their auxiliary control and operating mechanisms for essential services are to be examined and if considered necessary, to be operated under working conditions. All generators and steering motors are to be examined and tested under working conditions and if considered necessary, a full-load test may be carried out simultaneously.
(8) Where transformers of essential power supply are of wet type, the owner is to submit the liquid sample to an authoritative institution for testing its breakdown voltage, acidity and moisture. The report of test results is to be submitted to the Surveyor.
(9) Navigation lights are to be tested under working condition to verify correct indication and alarm on failure of power supply or of the lights.
(10) Emergency power source together with its automatic device and auxiliary power source are to be tested.
(11) Emergency lighting, temporary emergency lighting, supplementary emergency lighting, general alarm and public address system are to be tested in so far as practicable.
(12) For electrically propelled ships, the propulsion motors, generators, cables and all ancillary equipment and controls are to be examined and insulation resistance measured.

Section 11 SURVEYS OF THE OUTSIDE OF THE SHIP'S BOTTOM AND RELATED ITEMS

5.11.1 General requirements

5.11.1.1 Examinations of the outside of the ship's bottom and related items can be carried out with the ship in dry dock or on a slipway. Alternate examination may be carried out while the ship is afloat as an in-water survey, subject to provisions of 5.2.3 in Section 2 of this Chapter.
5.11.1.2 The interval between examinations of the outside of the ship's bottom and related items is to be in compliance with the provisions given in Section 2 of this Chapter.
5.11.1.3 Special consideration may be given in application of relevant requirements of this Section to commercial ships owned or chartered by Governments, which are utilized in support of military operations or service.

5.11.2 Scope of survey of the outside of the ship's bottom

5.11.2.1 General requirements
(1) When a ship is in dry dock or on a slipway, it is to be placed on blocks of sufficient height and with the necessary staging to permit the examination of elements such as shell plating including bottom and bow plating, stern frame and rudder, sea chests and valves, propeller, etc.
(2) The shell plating is to be examined for excessive corrosion, or deterioration due to chafing or contact with the ground and for any undue unfairness or buckling. Special attention is to be paid to the connection between the bilge strakes and the bilge keels. Important plate unfairness or other deterioration which do not necessitate immediate repairs is to be recorded.
(3) Sea chests and their gratings, sea connections and overboard discharge valves and cocks and their fastenings to the hull or sea chests are to be examined. Valves and cocks need not be opened up more than once in a special survey period unless considered necessary by the Surveyor.
(4) Visible parts of rudder, rudder pintles, rudder shafts and couplings and stern frame are to be examined. If considered necessary by the Surveyor, the rudder is to be lifted or the inspection plates removed for the examination of pintles. The clearance in the rudder bearings is to be ascertained and recorded. Limiting values for rudder bearing wear clearance are given in Appendix 4 of this Chapter. Where practicable, pressure test of the rudder may be required as deemed necessary by the Surveyor.
(5) Visible parts of propeller and stern bush are to be examined. The clearance in the stern bush and the efficiency of the shaft seals, if fitted, are to be ascertained and recorded. For controllable pitch propellers, the Surveyor is to be satisfied with the fastenings and tightness of hub and blade sealing. Dismantling need not to be carried out unless considered necessary by the Surveyor.
(6) Visible parts of side thrusters are to be examined. Other propulsion systems which also have manoeuvring characteristics (such as directional propellers, vertical axis propellers, water jet units) are to be examined externally with focus on the condition of gear housing, propeller blades, bolt locking and other fastening arrangements. Sealing arrangement of propeller blades, propeller shaft and steering column is to be verified.

5.11.3 In-water surveys

5.11.3.1 General requirements

(1) For the ships with In-Water Survey class notation, the in-water survey may be carried out to examine the underwater portions of the hull and machinery in addition to the provisions of 5.2.3. Specific requirements for in-water surveys are given in Chapter 12 of PART EIGHT of the Rules.

(2) At the request of the owner and under particular ambient conditions, CCS may agree to carry out the in-water survey to the ships without In-Water Survey class notation to replace the docking survey as described in 5.11.2 of this Section.

5.11.3.2 Conditions for in-water surveys

(1) In principle, there are to be no overdue repair items for the underwater portions of shell plating, rudder, propeller and propeller shaft, unless considered by CCS that such repairs are practicable when the ship is afloat.

(2) The in-water survey is to be carried out with the ship in sheltered water and preferably with weak tidal streams and currents. The in-water visibility and the cleanliness of the hull below the waterline is to be clear enough to permit a meaningful examination which allows the surveyor and the in-water survey firm to determine the condition of the plating, appendages and the welding. CCS is to be satisfied with the methods of orientation of the divers or Remotely Operated Vehicle (ROV) on the plating, which should make use where necessary of permanent markings on the plating at selected points.

(3) The equipment and procedure for observing and reporting the survey are to be discussed with the parties involved prior to the in-water survey, and suitable time is to be allowed to permit the in-water survey firm to test all equipment beforehand.

(4) The in-water survey is to be carried out under the surveillance of a CCS surveyor by an in-water survey firm approved as a service supplier by CCS according to Appendix 8 of this Chapter. A good two-way communication between the Surveyor and divers is to be provided.

5.11.3.3 Scope of the survey and survey report

(1) The in-water survey is to provide the information normally obtained from a docking survey. The scope of in-water survey is to be the same as the survey items listed in 5.11.2.1, so far as practicable. Special consideration may be given to ascertaining rudder bearing clearances and stern bush clearances of oil stern bearings based on a review of the operating history, on board testing and stern oil sample reports. These considerations are to be included in the proposals for in-water survey which are to be submitted by the owner or ship management company in advance of the survey so that satisfactory arrangements can be agreed with CCS.

(2) Upon completion of an in-water survey, a detailed report together with a video tape and photos showing main parts under survey are to be submitted by the in-water survey firm to the Surveyor.

(3) If the in-water survey reveals any damage or deterioration that requires early attention, the Surveyor is to require that the ship be dry-docked in order that a detailed survey can be undertaken and the necessary repairs carried out.

Section 12 SURVEYS OF PROPELLER SHAFTS AND TUBE SHAFTS

5.12.1 General requirements

5.12.1.1 Application

(1) Unless alternative means are provided to assure the condition of the propeller shaft assembly, these requirements apply to all vessels with conventional shafting fitted with a propeller as follows:

① from 1 January 2016 for ships delivered on or after 1 January 2016;

② after the first shaft survey scheduled on or after 1 January 2016, for ships delivered before 1 January 2016[①].

5.12.1.2 Definitions (see Figure 5.12.1.2)

(1) Shaft: For the purpose of this Section, shaft is a general definition, including:

① propeller shaft;

② tube shaft.

The definition does not include the intermediate shaft(s) which is(are) considered part of the propulsion shafting inside the vessel.

---

① Upon the completion of the first shaft survey scheduled on or after 1 January 2016, the designation of dates for the next shaft survey is to be made based upon the requirements of this Section.

(2) Propeller shaft: Propeller shaft is the part of the propulsion shaft to which the propeller is fitted. It may also be called screwshaft or tailshaft.
(3) Tube shaft: Tube shaft is a shaft placed between the intermediate shaft and propeller shaft, normally arranged within a stern tube or running in open water. It may also be called stern tube shaft.

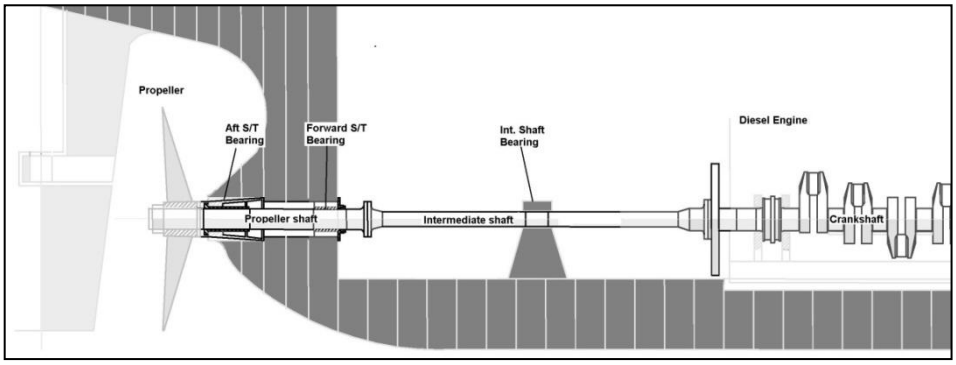

Figure 5.12.1.2 Typical Shafting Arrangement

(4) Sterntube: Tube or pipe fitted in the shell of a ship at the stern (or rear part of the ship), below the water-line, through which passes the tube shaft or aftermost section of the propeller-shaft. Sterntube is the housing of the shaft bearings, generally two (one aft and one fore), that sustain the shaft and allows its rotation with less frictional resistance. The stern tube also accommodates the shaft sealing arrangement.
(5) Closed loop (system) oil lubricated bearing: Closed loop oil lubricating systems use oil to lubricate the bearings and are sealed against the environment (seawater) by adequate sealing / gland devices.
(6) Water lubricated bearing: Water lubricated bearings are bearings cooled / lubricated by water (fresh or salt).
(7) Closed loop system fresh water lubricated bearing: Closed loop water lubricating systems use fresh water to lubricate the bearings and are sealed against the environment (such as seawater) by adequate sealing / gland devices.
(8) Open systems (water): Open water lubricating systems use water to lubricate the bearings and are exposed to the environment.
(9) Adequate means for protection against corrosion: An adequate means for protection against corrosion is an approved means for full protection of the core shaft against sea water intrusion and subsequent corrosion attack. Such means are used for the protection of common steel material against corrosion particularly in combination with water lubricated bearings. Typical means are for example:

① continuous metallic, corrosion resistant liners;
② continuous cladding;
③ multiple layer synthetic coating;
④ multiple layer of fiberglass;
⑤ combinations of above mentioned;
⑥ rubber / elastomer covering coating.

The means for protection against corrosion are installed / applied according to CCS approved procedures.
(10) Corrosion resistant shaft: Corrosion resistant shaft is made in approved corrosion resistant steel as core material for the shaft.
(11) Sterntube sealing system: Sterntube sealing system is the equipment installed on the inboard extremity and, for closed systems, at outboard extremity of the sterntube. Inboard seal is the device fitted on the fore part of the sterntube that achieve the sealing against the possible leakage of the lubricant media in to the ship internal. Outboard seal is the device fitted on the aft part of the sterntube that achieve the sealing against the possible sea water ingress and the leakage of the lubricant media.
(12) Service records: Service records are regularly recorded data showing in-service conditions of the shaft(s) and may include, as applicable: lubricating oil temperature, bearing temperature and oil consumption records (for oil lubricated bearings) or water flow, water temperature, salinity, pH, make-up water and water pressure (for closed loop fresh water lubricated bearings depending on design).
(13) Oil sample examination: An oil sample examination is a visual examination of the stern tube lubricating oil taken in presence of the surveyor with a focus on water contamination.
(14) Lubricating oil analysis: Lubricating oil analysis is to be carried out at regular intervals not exceeding six (6) months taking into account IACS Rec. 36. The documentation on lubricating oil analysis is to be available on board. Oil samples, to be submitted for the analysis, are to be taken under service conditions.

(15) Fresh water sample test[①]: Fresh water sample test is to be carried out at regular intervals not exceeding six (6) months. Samples are to be taken under service conditions and are to be representative of the water circulating within the sterntube. Analysis results are to be retained on board and made available to the surveyor. At time of survey the sample for the test has to be taken at the presence of the surveyor. Fresh water sample test is to include the following parameters:

① chlorides content;

② pH value;

③ presence of bearing particles or other particles (only for laboratory analysis, not required for tests carried out in presence of the surveyor).

(16) Keyless connection: Keyless connection is the forced coupling Methodology between the shaft and the propeller without a key achieved through interference fit of the propeller boss on the shaft tapered end.

(17) Keyed connection: Keyed connection is the forced coupling Methodology between the shaft and the propeller with a key and keyway achieved through the interference fit of the propeller boss on the shaft tapered end.

(18) Flanged connection: Flanged connection is the coupling Methodology, between the shaft and the propeller, achieved by a flange, built in at the shaft aft end, bolted to propeller boss.

(19) Alternative means: Shafting arrangements such as, but not limited to, an approved Condition Monitoring Scheme and / or other reliable approved means for assessing and monitoring the condition of the tail shaft, bearings, sealing devices and the stern tube lubricant system capable to assure the condition of the propeller shaft assembly with an equivalent level of safety as obtained by survey methods as applicable in this section.

5.12.2 Oil lubricated shafts or closed loop system fresh water lubricated shafts (closed system)

5.12.2.1 Shaft survey methods

(1) Method 1

The survey is to consist of:

① Drawing the shaft and examining the entire shaft, seals system and bearings.

② For keyed and keyless connections:

a. removing the propeller to expose the forward end of the taper;

b. performing a non-destructive examination (NDE) by an approved surface crack-detection method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted). For shaft provided with liners the NDE is to be extended to the after edge of the liner.

③ For flanged connection:

a. whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs or when deemed necessary by the Surveyor, the coupling bolts and flange radius are to be examined by means of an approved surface crack-detection method.

④ Checking and recording the bearing clearances.

⑤ Verification that the propeller is free of damages which may cause the propeller to be out of balance.

⑥ Verification of the satisfactory conditions of inboard and outboard seals during the re-installation of the shaft and propeller.

⑦ Recording the bearing weardown measurements (after re-installation).

(2) Method 2

The survey is to consist of:

① For keyed and keyless connections:

a. removing the propeller to expose the forward end of the taper;

b. performing a non-destructive examination (NDE) by an approved surface crack-detection method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted).

② For flanged connection:

a. whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs or when deemed necessary by the surveyor, the coupling bolts and flange radius are to be examined by means of a an approved surface crack-detection method.

③ Checking and recording the bearing weardown measurements.

---

① Fresh water sample procedure, refer to IACS REC143, Recommended procedure for the determination of contents of metals and other contaminants in a closed fresh water system lubricated stern tube.

④ Visual Inspection of all accessible parts of the shafting system.
⑤ Verification that the propeller is free of damages which may cause the propeller to be out of balance.
⑥ Seal liner found to be or placed in a satisfactory condition.
⑦ Verification of the satisfactory re-installation of the propeller including verification of satisfactory conditions of inboard and outboard seals.

Pre-requisites to satisfactorily verify in order to apply Method 2:
① Review of service records.
② Review of test records of:
a. lubricating oil analysis (for oil lubricated shafts), or
b. fresh water sample test (for closed system fresh water lubricated shafts).
③ Oil sample Examination (for oil lubricated shafts), or Fresh Water Sample test (for closed system fresh water lubricated).
④ Verification of no reported repairs by grinding or welding of shaft and/or propeller.

(3) Method 3

The survey is to consist of:
① Checking and recording the bearing weardown measurements.
② Visual Inspection of all accessible parts of the shafting system.
③ Verification that the propeller is free of damages which may cause the propeller to be out of balance.
④ Seal liner found to be or placed in a satisfactory condition.
⑤ Verification of the satisfactory conditions of inboard and outboard seals.

Pre-requisites to satisfactorily verify in order to apply Method 3:
① Review of service records.
② Review of test records of:
a. lubricating oil analysis (for oil lubricated shafts), or
b. fresh water sample test (for closed system fresh water lubricated shafts).
③ Oil sample examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated).
④ Verification of no reported repairs by grinding or welding of shaft and/or propeller.

5.12.2.2 Shaft extension surveys - Extension types

(1) Extension up to 2.5 years

The survey is to consist of:
① Checking and recording the bearing weardown measurements, as far as practicable.
② Visual Inspection of all accessible parts of the shafting system.
③ Verification that the propeller is free of damages which may cause the propeller to be out of balance.
④ Verification of the effectiveness of inboard and outboard seals.

Pre-requisites to satisfactorily verify in order to apply extension up to 2.5 years:
① Review of service records.
② Review of test records of:
a. lubricating oil analysis (for oil lubricated shafts), or
b. fresh water sample test (for closed system fresh water lubricated shafts).
③ Oil sample Examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated).
④ Verification of no reported repairs by grinding or welding of shaft and/or propeller.
⑤ Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

(2) Extension up to 1 year

The survey is to consist of:
① Visual Inspection of all accessible parts of the shafting system.
② Verification that the propeller is free of damages which may cause the propeller to be out of balance.
③ Verification of the effectiveness of inboard and outboard seals.

Pre-requisites to satisfactorily verify in order to apply extension up to 1 year:
① Review of the previous weardown and/or clearance recordings.
② Review of service records.
③ Review of test records of:
a. lubricating oil analysis (for oil lubricated shafts), or
b. fresh water sample test (for closed system fresh water lubricated shafts).

④ Oil sample examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated).
⑤ Verification of no reported repairs by grinding or welding of shaft and/or propeller.
⑥ Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

(3) Extension up to 3 months

The survey is to consist of:

① Visual Inspection of all accessible parts of the shafting system.
② Verification of the effectiveness of the inboard seal.

Pre-requisites to satisfactorily verify in order to apply extension up to 3 months:

① Review of the previous weardown and/or clearance recordings.
② Review of service records.
③ Review of test records of:
a. lubricating oil analysis (for oil lubricated shafts), or
b. fresh water sample test (for closed system fresh water lubricated shafts).
④ Oil sample examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated).
⑤ Verification of no reported repairs by grinding or welding of shaft and/or propeller.
⑥ Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

5.12.2.3 Oil lubricated shafts

(1) Survey intervals

For surveys completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

① Flanged propeller connection
The following methods are applicable:
a. Method 1 every 5 years, or
b. Method 2 every 5 years (pre-requisites have to be fulfilled), or
c. Method 3 every 5 years (pre-requisites have to be fulfilled).
② Keyless propeller connection
The following methods are applicable:
a. Method 1 every 5 years, or
b. Method 2 every 5 years (pre-requisites have to be fulfilled), or
c. Method 3 every 5 years (pre-requisites have to be fulfilled). The maximum interval between two surveys carried out according to Method 1 or Method 2 is not to exceed 15 years, except in the case when one extension for no more than three months is granted.
③ Keyed propeller connection
The following Methods are applicable:
a. Method 1 every 5 years, or
b. Method 2 every 5 years (pre-requisites have to be fulfilled).

(2) Survey extensions

For all types of propeller connections, the interval between two consecutive surveys may be extended after the execution of extension survey as follows:

① Extension up to a maximum of 2.5 years: no more than one extension can be granted. No further extension, of other type, can be granted.
② Extension up to a maximum of 1 year: no more than two consecutive “one year extension” can be granted. In the event an additional extension is requested the requirements of the “2.5 year extension” are to be carried out and the shaft survey due date, prior to the previous extension(s), is extended for a maximum of 2.5 years.
③ Extension up to a maximum of 3 months: no more than one “three months extension” can be granted. In the event an additional extension is requested the requirements of the “one year extension” or “2.5 years extension” are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of one year or 2.5 years.

The extension survey is to normally be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date.

If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date of the extension survey was completed.

5.12.2.4 Closed loop system fresh water lubricated shafts

The maximum interval between two surveys carried out according to Method 1 is not to exceed 15 years.

An extension for no more than three months can be granted.

(1) Survey intervals

For surveys completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

① Flanged propeller connection

The following methods are applicable:

a. Method 1 every 5 years, or
b. Method 2 every 5 years (pre-requisites have to be fulfilled), or
c. Method 3 every 5 years (pre-requisites have to be fulfilled).

② Keyless propeller connection

The following methods are applicable:

a. Method 1 every 5 years, or
b. Method 2 every 5 years (pre-requisites have to be fulfilled), or
c. Method 3 every 5 years (pre-requisites have to be fulfilled).

③ Keyed propeller connection

The following methods are applicable:

a. Method 1 every 5 years, or
b. Method 2 every 5 years (pre-requisites have to be fulfilled).

(2) Survey extensions

For all types of propeller connections, the interval between two consecutive surveys may be extended after the execution of extension survey as follows:

① Extension up to a maximum of 2.5 years, no more than one extension can be granted. No further extension, of other type, can be granted.

② Extension up to a maximum of 1 year, no more than two consecutive extensions can be granted. In the event an additional extension is requested the requirements of the "2.5 year extension" are to be carried out and the shaft survey due date, prior to the previous extension(s), is extended for a maximum of 2.5 years.

③ Extension up to a maximum of 3 months, no more than one "three months extension" can be granted. In the event an additional extension is requested the requirements of the "one year extension" or "2.5 years extension" are to be carried out and the shaft survey due date prior to the previous extension is extended for a maximum of one year or 2.5 years.

The extension survey is to normally be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date.

If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date of the extension survey was completed.

The maximum interval between two surveys carried out according to Method 1 is not to exceed 15 years, except in the case when one extension for no more than three months is granted.

5.12.2.5 Table of survey intervals (closed systems)

Survey intervals (closed systems)			
Oil lubricated			
	Flanged propeller coupling	Keyless propeller coupling	Keyed propeller coupling[b]
Every five years[a]	Method1 or Method 2 or Method 3	Method1 or Method 2 or Method 3[c]	Method1 or Method 2
Extension 2,5 Y	Yes[d]	Yes[d]	Yes[d]
Extension 1 Y	Yes[e]	Yes[e]	Yes[e]
Extension 3 M	Yes[f]	Yes[f]	Yes[f]
Closed loop system fresh water lubricated			
	Flanged propeller coupling	Keyless propeller coupling	Keyed propeller coupling[b]
Every five years[a]	Method1[g] or Method 2 or Method 3	Method1[g] or Method 2 or Method 3	Method1[g] or Method 2
Extension 2,5 Y	Yes[d]	Yes[d]	Yes[d]
Extension 1 Y	Yes[e]	Yes[e]	Yes[e]
Extension 3 M	Yes[f]	Yes[f]	Yes[f]
General notes: For surveys (Method 1, or Method 2, or Method 3) completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date. The extension survey is to normally be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date. If the extension survey is carried out more than 1 month prior to the shaft survey due date,			

then the period of extension counts from the date of the extension survey was completed.

Notes:
a: Unless an extension type (Extension 2,5 Y, Extension 1 Y, Extension 3 M) is applied in between.
b: Method 3 not allowed.
c: The maximum interval between two surveys carried out according to Method 1 or Method 2 is not to exceed 15 years, except in the case when one extension for no more than three months is granted.
d: No more than one extension can be granted. No further extension of other type can be granted.
e: No more than two consecutive extensions can be granted. In the event an additional extension is requested the requirements of the "2.5 year extension" are to be carried out and the shaft survey due date, prior to the previous extension(s), is extended for a maximum of 2.5 years.
f: No more than one three months extension can be granted. In the event an additional extension is requested the requirements of the one year extension or "2.5 years extension" are to be carried out and the shaft survey due date prior to the previous extension is extended for a maximum of one year or 2.5 years.
g: The maximum interval between two surveys carried out according to Method 1 is not to be more than 15 years.

5.12.3 Water lubricated shafts (open systems)

5.12.3.1 Shaft Survey Methods

(1) Method 4

The survey is to consist of:

① Drawing the shaft and examining the entire shaft (including liners, corrosion protection system and stress reducing features, where provided), inboard seal system and bearings.

② For keyed and keyless connections:

a. removing the propeller to expose the forward end of the taper;

b. performing a non-destructive examination (NDE) by an approved surface crack-detection method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted). For shaft provided with liners the NDE is to be extended to the after edge of the liner.

③ For flanged connection:

a. whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs or when deemed necessary by the surveyor, the coupling bolts and flange radius are to be examined by means of an approved surface crack-detection method.

④ Checking and recording the bearing clearances.

⑤ Verification that the propeller is free of damages which may cause the propeller to be out of balance.

⑥ Verification of the satisfactory conditions of inboard seal during re-installation of the shaft and propeller.

5.12.3.2 Shaft extension surveys - extension types

(1) Extension up to 1 year

The survey is to consist of:

① Visual Inspection of all accessible parts of the shafting system.

② Verification that the propeller is free of damages which may cause the propeller to be out of balance.

③ Checking and recording the clearances of bearing.

④ Verification of the effectiveness of the inboard seal.

Pre-requisites to satisfactorily verify in order to apply extension up to 1 year:

① Review of the previous clearance recordings.

② Service records.

③ Verification of no reported repairs by grinding or welding of shaft and/or propeller.

④ Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

(2) Extension up to 3 months

The survey is to consist of:

① Visual Inspection of all accessible parts of the shafting system.

② Verification that the propeller is free of damages which may cause the propeller to be out of balance.

③ Verification of the effectiveness of the inboard seal.

Pre-requisites to satisfactorily verify in order to apply extension up to 3 months:

① Review of the previous clearance recordings.

② Service records.

③ Verification of no reported repairs by grinding or welding of shaft and/or propeller.

④ Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

5.12.3.3 Shaft survey intervals

(1) Survey intervals

The following survey intervals between surveys according to Method 4 are applicable to all types of propeller connections. For keyless propeller connections the maximum interval between two consecutive dismantling and verifications of the shaft cone by means of non-destructive examination (NDE) is not to exceed 15 years. For surveys completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

① Configurations allowing 5 year intervals:

a. single shaft operating exclusively in fresh water;
b. single shaft provided with adequate means of corrosion protection, single corrosion resistant shaft;
c. all kinds of multiple shafts arrangements.

② Other systems.

Shaft not belonging in one of the configurations listed in 5.12.3.3(1)① has to be surveyed according to Method 4 every 3 years.

(2) Survey extensions

For all types of propeller connections, the interval between two consecutive surveys may be extended after the execution of extension survey as follows:

① Extension up to a maximum of 1 year: no more than one extension can be granted. No further extension, of other type, can be granted.

② Extension up to a maximum of 3 months: no more than one "three months extension" can be granted. In the event an additional extension is requested the requirements of the "one year extension" are to be carried out and the shaft survey due date prior to the previous extension is extended for a maximum of one year.

The extension survey is to normally be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date.

If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date of the extension survey was completed.

5.12.3.4 Table of survey intervals (open systems)

</table>

5.12.4 Survey related to notation SCM

5.12.4.1 For ships which are assigned the notation SCM in accordance with Appendix 14 "Guidelines for Screwshaft Condition Monitoring System" of this Chapter, if they are found satisfactory at a survey of the items specified in 5.12.4.3, 5.12.4.4 or 5.12.4.5, it may be not necessary to consider items related to the drawing of oil lubricated screwshaft for examination when the examination is carried out in accordance with 5.12.2.1(1) or 5.12.3.1(1), and the interval of drawing may be extended to a maximum period not exceeding 15 years for water lubricated screwshaft.

5.12.4.2 Notwithstanding the notation SCM, the survey is to comply with 5.12.2.1(1) or 5.12.3.1(1).
5.12.4.3 For oil-lubricated propeller shafts, the shaft condition monitoring (SCM) is to be verified during each annual survey of the ship, covering:
(1) onboard condition monitoring records, including lubricating oil consumption records, lubricating oil operating temperature records, propeller shaft condition records, etc.;
(2) confirmation that lubricating oil samples have been submitted to an approved analysis organization at least once every 6 months for analysis and test of water content, chloride content, content of bearing metal particles and oil aging (resistance to oxidation);
(3) verification that analysis and test records of the analysis organization together with a conclusion on the condition and suitability of the oil are kept on board;
(4) verification of an oil analysis report from the last 6 months.
5.12.4.4 For closed water-lubricated propeller shafts, the shaft condition monitoring (SCM) is to be verified during each annual survey of the ship, covering:
(1) propeller shaft condition records, including alarm records, examination and maintenance records, lubricating water sampling / testing records and closed cycle lubricating water consumption records;
(2) confirmation that lubricating water samples have been submitted to a laboratory analysis organization complying with international standards (e.g. ISO/IEC 17025) or accepted by CCS complying with equivalent standards at least once every 6 months for analysis and test of the samples; the water quality parameters include at least:
① chloride content;
② PH value;
③ content of bearing particles.
(3) verification that water quality analysis report issued by the analysis organization, together with a qualification certificate of the organization and a conclusion on the condition and suitability of the water, are kept on board; the Surveyor is to verify a water quality analysis report from the last 6 months;
(4) examination and confirmation that the lubricating water supply system (including pumping and water filters/separators), alarm system and shaft starting interlock are in normal condition.
5.12.4.5 For open water-lubricated propeller shafts, the SCM is to be verified during the annual survey, covering:
(1) propeller shaft condition records, including alarm records, examination and maintenance records, lubricating water sampling / testing records, etc.;
(2) confirmation that the ship has developed procedures for sampling and testing supply water and is provided with the testing kit. Lubricating water is sampled at least once every 6 months to test the size of particles in the supply water so as to confirm that the water complies with the design requirements of the manufacturer. The ship can also submit the water samples to a laboratory analysis organization complying with international standards (e.g. ISO/IEC 17025) or accepted by CCS complying with equivalent standards for analysis and test. In the absence of procedures for sampling and testing supply water or records for sampling and testing, there is to be other equivalent means to prove that the supply water system is in a satisfactory working condition, and specific equivalent means may be referred to 1.3.2.5, Appendix 14 Guidelines for Screwshaft Condition Monitoring System of this Chapter.
(3) Check the supply water treatment system (including pumping and filtration or separation units), alarm system and shaft starting interlock, and confirm that they are in normal condition.
5.12.4.6 For ships assigned with the SCM notation, when the survey may be carried out without drawing of the shaft, if the surveyor deems that the available information is not satisfactory or any doubt exists, the shaft is to be sufficiently drawn to permit an entire examination.

5.12.5 Surveys of other propulsion arrangements

5.12.5.1 An operational test is to be carried out to the controllable pitch propellers to detect leakage. The controllable pitch propellers are to be dismantled for examining the working parts and control gear when considered necessary.
5.12.5.2 Azimuth propulsion arrangements (Z propulsion arrangement, Duck propulsion arrangement, REX propulsion arrangement and steering oar arrangement) are to be dismantled for examining propeller, shafts, gearing and control gear.
5.12.5.3 Water jet propulsion arrangements are to be dismantled for examining impeller, casing, shaft, shaft seal, shaft bearing, inlet and outlet channels, steering nozzles, reversion units and control gear.

Section 13 BOILER SURVEYS

5.13.1 General requirements

5.13.1.1 This Section applies to surveys of the ship's main boilers, auxiliary boilers for essential services, superheaters, steam heated steam generators, economizers, thermal oil and hot water units, boilers for non-essential services having working pressure exceeding 0.35 MPa and a heating surface exceeding 4.5 m^2 and steam pipes.

5.13.1.2 Special consideration may be given in application of relevant requirements of this Section to commercial ships owned or chartered by Governments, which are utilized in support of military operations or service.

5.13.1.3 Definitions

(1) Main boilers are boilers supplying steam for main propulsion engines.

(2) Auxiliary boilers for essential services (including exhaust boilers, economizers and steam heated steam generators) are boilers supplying steam for auxiliary machineries essential for the safety or the operation of the ship at sea, but not for main propulsion engines.

(3) Auxiliary boilers for nonessential services are boilers supplying steam not exclusively for the safety or the operation of the ship at sea.

(4) Exhaust gas heated economizers are forced-circulation exhaust gas heat exchangers not capable of directly supplying steam, and requiring fired boilers as steam storage for supplying steam.

(5) Exhaust gas boilers are exhaust gas heat exchangers capable of directly supplying steam or forced-circulation exhaust gas heat exchangers. The latter, which is not capable of directly supplying steam, supplies steam by means of its steam reservoir.

(6) Thermal oil units are heaters which heat organic liquid (thermal oil) by fuel oil, exhaust gas or electricity, and in which the temperature of the heated organic liquid is constantly kept below its boiling temperature at atmospheric pressure.

(7) Hot water units are heaters which heat water by fuel oil, exhaust gas or electricity, and in which the temperature of the heated water is constantly kept below its boiling temperature at atmospheric pressure.

5.13.2 Interval of surveys

5.13.2.1 Main boilers

(1) For all main boilers up to 10 years of age, a minimum of two internal inspections is to be carried out during each 5-year special periodical survey period. In all cases, the interval between any two such inspections is not to exceed 36 months.

(2) Water tube boilers over 10 years of age used for main propulsion:

① for ships fitted with 2 or more water tube boilers, a minimum of two internal inspections is to be carried out during each 5-year special periodical survey period. In all cases, the interval between any two such inspections is not to exceed 36 months;

② for ships fitted with one water tube boiler, an internal inspection is to be carried out annually.

(3) For water tube boilers over 10 years of age, an internal inspection is to be carried out annually.

5.13.2.2 For auxiliary boilers for essential services, superheaters, thermal oil heaters, boilers for non-essential services having working pressure exceeding 0.35 MPa and a heating surface exceeding 4.5 m^2, a minimum of two internal inspections is to be carried out during each 5-year special periodical survey period. In all cases, the interval between any two such inspections is not to exceed 36 months.

5.13.2.3 A general inspection of the outside of boilers is to be carried out annually in the course of the annual survey of a ship.

5.13.2.4 Periods of steam pipe surveys

(1) Steam pipes over 76 mm external diameter where working temperature is not over 450℃, and copper and copper alloy steam pipes over 76 mm external diameter are to be surveyed for the first time at the 10th year from the date of fabrication (or installation) and thereafter at five-yearly intervals.

(2) Steam pipes over 76 mm external diameter where working temperature is over 450℃ are to be surveyed for the first time at the 5th year from the date of fabrication (or installation) and thereafter at five-yearly intervals.

5.13.3 Scope of surveys

5.13.3.1 The internal examination of steam boilers is to cover the following:

(1) at each survey, the boilers, superheaters, economizers, and steam heated steam generators are to be examined internally on water-steam side and fire side, including drum, shell, tubes, stays and insulation;

(2) boiler mountings and safety valves are to be examined at each survey and opened out as considered necessary by CCS;

(3) when direct visual internal inspection is not feasible due to the limited size of the internal spaces, such

as for small boilers and/or narrow internal spaces, this may be replaced by a hydrostatic pressure test or by alternative verifications as determined by CCS;
(4) the adjustment of the safety valves is to be verified under steam during each boiler internal survey. Boiler safety valve and its relieving gear (emergency cut-off device) are to be examined and tested to verify satisfactory operation;
(5) for exhaust gas heated economizers and boilers, if steam cannot be raised at port, the safety valves may be set by the chief engineer at sea, and the results recorded in the logbook for review by CCS;
(6) instrumentation and automatic equipment, and the thermal oil burning equipment and systems with which they are associated, are to be examined and tested;
(7) pumps serving for forced-circulation boilers or economizers are to be opened out for examination;
(8) review of the following records since the last boiler survey is to be carried out as part of the survey:
① operation;
② maintenance;
③ repair history;
④ feedwater chemistry;
(9) when considered necessary by the Surveyor, any part may be tested by hydraulic pressure, measured for thickness and/or detected for cracks;
(10) where an internal examination of a boiler cannot be directly carried out due to its structure, an alternative hydraulic test with a pressure 1.25 times the working pressure may be accepted.
5.13.3.2 The external examination of boilers is to cover the following:
(1) external survey of boilers is to be carried out annually, within the window of the annual survey of a ship;
(2) external survey of boilers includes test of safety and protective devices, and test of safety valve using its relieving gear;
(3) foundations, insulation, fittings, collision chocks, rolling stays, piping, combustion system, safety and protective systems including relieving gear are to be examined for confirming that they are in a good working condition;
(4) for exhaust gas heated economizers and boilers, the safety valves are to be tested by the chief engineer at sea within the annual survey window. This test is to be recorded in the logbook for review by the attending Surveyor.
5.13.3.3 The examination of exhaust gas heated economizers is to cover the following:
(1) in addition to the requirements for internal examination of exhaust gas heated economizers of the shell type, all accessible welded joints are to be subjected to a visual examination for cracking;
(2) when necessary, nondestructive testing may be required for this purpose.
5.13.3.4 The survey of thermal oil units is to cover the following:
(1) a general examination of the main body and fittings of the units is to be carried out. The internal examination may be dispensed with if no any sign of oil-caused internal corrosion is found;
(2) the internal examination by means of lifting is to be carried out so far as practicable, including examination of pipes, pipe holders and hangers, to verify that no corrosion and friction-caused roughness exists. Where heaters and fittings can not be lifted for internal examination, they are to be operationally tested under working pressure to ensure their integrity;
(3) particular attention is to be paid to the integrity of burning system and safety device;
(4) foundations, insulation, fittings, collision chocks, rolling stays, piping, combustion system, safety and protective systems together with emergency cut-off devices for combustion are to be examined for confirming that they are in a good working condition;
(5) safety valves of pressure pumps are to be calibrated under working pressure.

5.13.4 Survey extensions

5.13.4.1 An extension of the internal examination of the boiler up to 3 months beyond the due date may be granted in exceptional circumstances[①], where the following examinations and/or review are satisfactorily carried out:
(1) external examination of the boiler;
(2) boiler safety valve relieving gear (easing gear) is to be examined and operationally tested;
(3) boiler protective devices operationally tested;
(4) review of the records of operation, maintenance, repair history and feedwater chemistry since the last boiler survey.

---

① As defined in ②, ③ and ④ in 2.1.3.1(28) of Chapter 2 of this PART.

5.13.5 Surveys of steam pipes

5.13.5.1 Scope of surveys

(1) A selected number of main steam pipes, also of auxiliary steam pipes, are to be removed for internal examination and are to be hydraulically tested to 1.5 times the working pressure. If these selected pipes are found satisfactory in all respects, the remainder need not be tested.

(2) Copper and copper ally steam pipes are to be hydraulically tested to 2 times the working pressure.

5.13.5.2 Where it is inconvenient to fulfill the requirements of 5.13.5.1(1) and (2) and at the request of the owner, consideration may be given to postponement of the survey, either wholly or in part.

Section 14 INITIAL CLASSIFICATION SURVEYS OF SHIPS CONSTRUCTED NOT UNDER THE SUPERVISION OF CCS

5.14.1 General requirements

5.14.1.1 The initial classification surveys of ships constructed not under the supervision of CCS includes:

(1) initial classification surveys of ships which are under construction;

(2) initial classification surveys of ships after construction.

5.14.1.2 The initial classification surveys specified in this Section include surveys related to class notations.

5.14.1.3 Whenever CCS is requested by an owner to accept the transfer of class for a ship and the losing Society is the Society accepted by CCS, CCS is to immediately notify the owner in writing that:

(1) the relevant surveys specified in 5.14.3.1 are required to be satisfactorily completed for entry into class;

(2) for ships less than 15 years of age, a Certificate of Class can be issued only after CCS has completed:

① all overdue surveys; and

② all overdue recommendations/conditions of class previously issued against the ship as specified to the owner by the losing Society;

(3) for ships 15 years of age and over, a Certificate of Class can be issued only after confirmation by CCS that the losing Society has completed:

① all overdue surveys; and

② all overdue recommendations/conditions of class previously issued against the ship;

(4) any outstanding recommendations/conditions of class are to be dealt with by their due dates;

(5) the principles given in items (1), (2) and (3) above apply to any additional recommendations/conditions of class issued against the ship arising from surveys which were not included in the initial survey status provided by the losing Society because the surveys were carried out in close proximity to the request for transfer of class. Such additional recommendations/conditions of class if received after the issuance of the Interim Certificate of Class by CCS and which are overdue are to be dealt with at the first port of call by the relevant Society depending on the age of the ship;

(6) copies of the plans listed in this Section are to be provided to CCS as a prerequisite to confirming the final classification of ships.

5.14.1.4 If found satisfactory at the survey, load lines will be marked in accordance with Section 11, Chapter 1 of PART TWO of the Rules.

5.14.2 Initial classification surveys of ships under construction

5.14.2.1 Initial classification surveys of ships which have been surveyed by the Societies accepted by CCS

(1) All plans, calculations and other technical documents for construction (approved by the losing Society according to their rules) are to be submitted to CCS for check. The construction of these ships may, in general, continue in accordance with the approved plans.

(2) In addition to the normal items for newbuildings, the following items are to be checked (unless they have been checked and relevant records made by the losing Society):

① the shipyard is to submit records of the checked or confirmed items for review;

② the Surveyor is to carry out an overall survey of the compartments, spaces and installations which have been inspected and confirm that materials, scantlings, workmanship and arrangements are in compliance with the approved plans;

③ the information on the attended inspections and tests of compartments is to be accepted when such information is confirmed as authentic. When some of the compartments are to be tested again, e.g.

functional tests during sea trial and in particular the inspection and testing of cargo holds and ballast tanks, the new tests are to be attended;

④ the records of NDTs are to be checked and if necessary, sampled. Any NDT is to comply with the provisions of the Rules;

⑤ the materials (including forgings and castings) used for construction, and manufacturing and testing of anchors and anchor chains are to meet the requirements of the accepted standards;

⑥ main propulsion machinery and essential auxiliaries are to be manufactured, installed and tested in accordance with CCSs rules or the standards acceptable to CCS;

⑦ the anchors and anchor chains are to be inspected and certified in accordance with the CCS rules, if they have not been delivered to the shipyard;

⑧ all outstanding recommendations are to be completed.

5.14.2.2 Initial classification surveys of ships which have been surveyed by other Societies

(1) All plans, calculations and other technical documents for construction are to be submitted to CCS for examination and approval. Where any change is made in the originally approved plans as the result of the examination, the construction is to be changed in accordance with the re-approved plans.

(2) In principle, the surveys are to be carried out in accordance with the same requirements as specified in 5.14.2.1 of this Section and if necessary, the completed items may be sampled.

5.14.2.3 Requirements for double classed ships or dual class ships:

(1) for double classed ships, the scope of survey is to be in accordance with 5.14.2.1 or 5.14.2.2;

(2) for dual class ships:

① Plans submission and survey are to be in accordance with 4.6.2, Section 6, Chapter 4 of this PART;

② If the ship applies for the dual class before the date of launching, the plans submission and scope of survey are to be in accordance with 5.14.2.1 or 5.14.2.2.

5.14.3 Initial classification surveys of ships after construction

5.14.3.1 Initial classification surveys of ships which have been surveyed by the Societies accepted by CCS

(1) Initial classification surveys of ships which have been certified by the Societies accepted by CCS:

① When applying for an initial classification survey, as the prerequisite for issuance of a long-term classification certificate by CCS, the owner is to submit at least one copy each of the plans, calculations and other technical documents to CCS for check, including at least the following:

a. Main plans:
   (a) General arrangement;
   (b) Capacity plan;
   (c) Hydrostatic curves;
   (d) Loading manual (if required);
   (e) Damage Stability calculation, where required.

b. Plans of hull structure:
   (a) Transverse midship section;
   (b) Construction profile, including longitudinal section, decks, inner bottom structure, superstructure and deckhouse;
   (c) Transverse bulkhead;
   (d) Shell expansion;
   (e) Rudder and rudder stock;
   (f) Hatch covers;
   (g) For CSR ships, plans showing, for each structural element, both as-built and renewal thicknesses and any thickness for "voluntary addition";
   (h) Plan of stern frame (if required).

c. Plans of machinery:
   (a) Engine room arrangement;
   (b) Intermediate shaft, thrust shaft and propeller shaft;
   (c) Propeller;
   (d) Main engine, propulsion machinery and clutch systems (or manufacturer, model and specifications);
   (e) In addition, main boiler, superheater and economizer (or manufacturer, model and specifications) and steam piping for steam turbine ships;
   (f) Bilge and ballast piping diagram;

(g) Wiring Diagram;
(h) Steering gear piping system and arrangement, manufacturer and model.

d. Torsional vibration calculations for shafting to be submitted for ships less than 2 years of age.

e. Elastic coupling of propulsion shafting and/or shaft torque limiter (or manufacturer, model and specifications) additionally required for ships with ice class notation.

f. Additional plans required for oil tankers:
(a) Pumping arrangement at the forward and after ends and drainage of cofferdams and pump rooms.

g. Additional plans required for periodically unattended machinery spaces:
(a) Checklist of measuring instruments and alarms;
(b) Arrangement of fixed fire alarm system;
(c) List of automatic safety functions (e.g. slowdowns, shutdowns, etc.);
(d) Diagram of functional tests.

h. Any other information requested by the flag State Administration.

i. Document(s) of approval of alternative design and arrangements, if any.

② Where the plans and documents can not be submitted according to (1) above, it is recommended that the owner authorize the losing Society to transfer copies of such plans and documents as it may possess directly to CCS. CCS may accept other relevant technical information as equivalent.

③ Where the information on stability including intact, subdivision and damage stability and the loading manual have been approved by the flag State Administration or an organization authorized by it and compliance of the arrangement on board the ship with the approved information has been confirmed by CCS, CCS may accept the approved information as the basis for assigning class or issuing certificates.

④ In addition to the items corresponding to ship's age and losing class status, the extent of surveys is to include the following:

a. Hull:
(a) For ships of less than 5 years, an annual survey is to be carried out.
(b) For ships between 5 and 10 years of age the survey is to include an Annual Survey and inspection of a representative number of ballast spaces, such as fore peak, aft peak, topside tank, hopper tank, double bottom tank, etc.
(c) For ships of 10 years of age and above but less than 20 years of age, the survey is to include an Annual Survey and inspection of a representative number of ballast spaces and cargo spaces, except for:
For gas carriers, in lieu of internal inspection of cargo spaces, the following applies:
ⓐ Inspection of surrounding ballast tank(s) and void spaces, including external inspection of independent cargo tank(s) and associated supporting systems as far as possible;
ⓑ review of cargo log books and operational records to verify the correct functioning of the cargo containment system.
For oil tankers (including product carriers), and chemical tankers of 10 years of age and above but less than 15 years of age, in lieu of an internal inspection of cargo tanks without internal stiffening and framing, inspections of surrounding ballast tank(s) and void spaces and deck structure, are to be applied.
(d) For oil tankers (including double hull oil tankers), chemical tankers and bulk carriers (including double skin bulk carriers) of 15 years and over, the requirements for special or intermediate surveys (whichever is due) are to be complied with, i.e., if the ship is in the first year after completion of the special survey, the intermediate survey is to be completed at the time of transfer of class, and if the ship is in the third or fourth year after completion of the intermediate survey, the special survey is to be completed.
(e) For ships of 20 years and over, the requirements for special surveys are to be complied with, and this applies also to ships under continuous hull survey.
(f) If a dry-docking of the ship is not due at the time of transfer of class, and subject to consent of the Headquarters of CCS, an underwater examination may be taken in lieu of dry-docking required in (d) and (e).
(g) In the context of applying items a) to f) above, as applicable, the anchors and anchor chain cables ranging and gauging for vessels over 15 years of age is not required to be carried out as part of the class entry survey unless the class entry survey is being credited as a periodical survey for maintenance of class.
If the class entry survey is to be credited as a periodical survey for maintenance of class and

the anchors and anchor chain cables ranging and gauging of the losing society are to be carried out by CCS within the applicable survey window of the periodical survey in question, at the request of the owner and approved by CCS Headquarters, consideration may be given by CCS to the acceptance of measurement report by the losing Society.

(h) In the context of applying items (a) to (f) above, as applicable,
- if the class entry survey is to be credited as a periodical survey for maintenance of class, consideration may be given by CCS to the acceptance of thickness measurements taken by the losing Society, provided they were carried out within the applicable survey window of the periodical survey in question; or
- if the class entry survey is not to be credited as a periodical survey for maintenance of class, consideration may be given by CCS to the acceptance of thickness measurements taken by the losing Society, provided they were carried out within 15 months prior to completion of the class entry survey when it is in the scope of a special survey, within 18 months prior to completion of the class entry survey when it is in the scope of an intermediate survey,

in both cases, at the request of the owner and approved by CCS Headquarters, the thickness measurements are to be reviewed by CCS for compliance with the applicable survey requirements, and confirmatory gauging are to be taken to the satisfaction of CCS.

(i) In the context of applying (c) to (f) above, as applicable, tank testing for ships over 15 years of age is not required to be carried out as part of the class entry survey unless the class entry survey is being credited as a periodical survey for maintenance of class. If the class entry survey is to be credited as a periodical survey for maintenance of class, consideration may be given by CCS to the acceptance of the tank testing carried out by the losing society provided they were carried out within the applicable survey window of the periodical survey in question.

(j) In the context of applying (a) to (f) above, as applicable, compliance with rules (e.g. 5.3.5 of Section 3 of this Chapter) that require compliance at the forthcoming due periodical surveys are not required to be carried out/completed as part of the class entry survey unless the class entry survey is credited as a periodical survey for maintenance of class.

b. Machinery (including electrical installations):

(a) A general examination of all essential machinery is to be held and is generally to include[①]:
- ⓐ examination under working conditions of oil fuel burning equipment of boiler, economizers and steam/steam generators. The adjustment of safety valves of this equipment is to be verified by checking the records on the ship;
- ⓑ compliance of all pressure vessels with submitted drawings and certificates is to be verified, and all pressure vessels are to be examined in working conditions;
- ⓒ insulation resistance, generator circuit breakers, preference tripping relays and generator prime mover governors are to be tested and paralleling and load sharing to be proved;
- ⓓ in all cases, navigating lights and indicators are to be examined and their working and alternative sources of power verified;
- ⓔ bilge pumps, emergency fire pumps and remote controls for oil valves, oil fuel pumps, lubricating oil pumps and forced draught fans are to be examined under working conditions;
- ⓕ compliance of recirculating and ice-clearing arrangements with class notations is to be verified, if any;
- ⓖ the main and all auxiliary machinery necessary for operation of the ship at sea together with essential controls and steering gear are to be tested under working conditions. Alternative means of steering are to be tested. A short sea trial is to be held at the Surveyor's discretion if the ship has been laid up for a long period;
- ⓗ initial start arrangements are to be verified;
- ⓘ in the case of oil tankers, the cargo oil system and electrical installations in way of hazardous spaces are to be checked for compliance with rules. Where intrinsically safe equipment is installed, the Surveyors are to satisfy themselves that such equipment has been approved by the Society accepted by CCS or an organization authorized by it. The

① For the transfer of class to CCS or adding CCS class at a ship's delivery, items ⓒ and ⓘ may be verified by reviewing the ship's record.

safety devices, alarms and essential instruments of the inert gas system are to be verified and the plant generally examined to ensure that it does not constitute a hazard to the ship.

c. When repair and survey facilities are not available in the first port of initial classification survey (also referred to as "survey for transfer of class") required by 5.14.3.1(1), the survey may be carried out stepwise and CCS may allow the ship to undertake a direct voyage to a port where such facilities are available to complete all surveys required. Such surveys are to be carried out by CCS or the losing Society, to the maximum extent practicable at the first port of survey, but in no case less than the scope of annual hull survey and additional machinery surveys as required in 5.14.3.1(1)④b.

d. The surveys for transfer of class may be carried out in conjunction with required periodical surveys after construction. Where such surveys are not carried out in conjunction with periodical classification surveys related, the conditions of class which are not overdue and required to be completed in conjunction with periodical surveys need not be completed at surveys for transfer of class.

e. After the surveys stated in 5.14.3.1(1)① to ④ of this Section, the interval between surveys may be corresponding to that of the losing society.

f. Requirements for double classed ships or dual class ships:

(a) for double classed ships, the scope of survey is to be in accordance with 5.14.3.1(1)① and ④;

(b) for dual class ships, the scope of survey is to be at least in accordance with that of annual surveys. If the ship applies for the dual class after construction, the scope of survey is to be in accordance with 5.14.3.1(1)① and ④.

(2) Initial classification surveys of ships which have not been certified by the Societies accepted by CCS:

① submission of plans and documents for review and survey items are to be in accordance with 5.14.3.1(1) of this Section;

② the owner is to submit records and reports related to surveys, testing and measurement during construction as well as certificates, test information, etc. for main marine products;

③ the Surveyors are to examine main structural dimensions to confirm compliance with relevant provisions of the Rules;

④ if necessary, test and/or survey for confirmation is to be carried out.

5.14.3.2 Initial classification surveys of ships which have been surveyed by other Societies

(1) This paragraph applies to ships which are constructed not in accordance with CCS rules and were not classed with CCS or any classification society acceptable to CCS.

(2) In general, such ships are to comply with the present rules of CCS, at least with CCS rules applicable during construction of the ships.

(3) The plans of such ships are in general to be submitted as required for ships under construction in CCS rules. Where it is difficult to submit plans related to quality control during construction, methods are to be provided for assessment and verification of related structures or equipment. Where such methods are assessed by CCS as acceptable and verified during classification surveys, exemption from submission of related plans may be granted. In cases where the vessel has been previously classed by the Society, the submission of plans and the extent of plan appraisal may be specially considered subject to confirmation of no alteration/modification to the vessel. In any case, it is to be ensured that at least the plans, calculations and other technical documents listed in 5.14.3.1(1)① are submitted to CCS for approval.

(4) The surveys are to be based on the requirements for special surveys in CCS rules for ships of the same type and age and include dry-dock survey, and surveys of propeller shafts and tube shafts, boilers and as applicable, inert gas systems. In addition, the following items are to be included:

① hull thickness measurements according to the minimum requirements for thickness measurements at the 4th special survey;

② any further survey required by CCS according to inspection of the condition of the ship and review of its service and repair history, including non-destructive testing of important welds of hull structures to a certain proportion and increasing the extent of testing as appropriate;

③ examination of records of surveys, tests and measurements of the ship during construction, including materials used, means of construction and testing, standards and extent of non-destructive testing of hull welds, records of mooring test and sea trial, and certificates of marine products, together with necessary verification during survey;

④ verification of related structures or equipment using the methods accepted in (3) above.

⑤ Where the vessel has, during any portion of the five years prior to the request for classification being received, been previously classed by the Society or a Society subject to verification of compliance with QSCS and has not been subject to alteration or modification since class was withdrawn, the survey requirements may be specially considered but are not to be less than the following:

a. for vessels previously classed with the Society – all overdue surveys and overdue conditions of class, or

b. for vessels previously classed with a Society subject to verification of compliance with QSCS –surveys the same as those required by 5.14.3.1.(1)④.

Section 15 OTHER SURVEYS

5.15.1 Surveys of repairs, alterations and modifications of a major character①

5.15.1.1 General requirements

(1) This paragraph applies to surveys of repairs, alterations and modifications which substantially change one or more of the following characteristics of existing ships (hereinafter referred to as major conversions):

① main dimensions of a ship;

② ship type;

③ level of subdivision of a ship;

④ carrying capacity of a ship;

⑤ passenger accommodation spaces;

⑥ increasing a ship's service life;

⑦ other major conversions in the opinion of the Administration.

5.15.1.2 Surveys

(1) Plans and documents for ships to undergo a major conversion are to be submitted to CCS for approval. The converted part of the hull structure is to comply with the requirements of the present rules. The ship's structural strength after conversion is to be evaluated according to the present rules. Other altered items, e.g. machineries (including electrical installations), inert gas systems, automation systems and other equipment related to classification, are to be treated as those of newbuildings, i.e. the present rules of CCS are to be complied with.

(2) Grades of the materials used for the alteration are in general to be the same as or equivalent to those indicated in the approved plans.

(3) Welds are to be tested for tightness and where the tightness test is impracticable or will affect the performance of fittings and equipment, visual inspections or inspections by other equivalent means are to be carried out and in addition, certain essential welds are to be subject to non-destructive test in accordance with CCS rules.

(4) CCS will carry out overall or local surveys and tests of the altered ship as appropriate to ensure that the materials used and workmanship are satisfactory in all respects and that the ship is fit for the intended purpose, and if applicable, the load lines are to be marked in accordance with Section 11, Chapter 1 of PART TWO.

(5) New certificates will be issued for altered ships according to their new dimensions, types and intended purposes. The period of validity of new certificates is to be based on the survey status and is in general to be corresponding to that of the existing certificates.

(6) Where new characters of classification and ship type notation(s) are intended to be assigned to a converted ship, the initial classification survey required of the new ship type is to be carried out and appropriate survey documents are to be issued.

(7) Inclining tests are in general to be carried out for ships which have undergone a major conversion. The inclining test may be dispensed with upon approval by the flag State Administration.

(8) Sea trials are to be carried out for ships which have undergone a major conversion, except all of the following conditions are met:

① the main propulsion system is not altered;

② the steering system is not altered;

③ the main dimensions and moulded line of the ship are not altered;

④ the draft of the ship is not increased.

---

① See Guidelines for Implementation of Major Conversions of Ships, 2008.

5.15.2 Occasional surveys

5.15.2.1 General requirements

(1) For any occasional survey covered by 5.2.11 of this Chapter, the owner or operator of the ship is to make an application to CCS.

(2) If the owner or operator of the ship, in respect to any damage or repairs of the ship, directly applies for any related periodical survey specified in the Rules, a separate application for an occasional survey need not be made.

(3) When applying for an occasional survey, the relevant requirements of this paragraph and in addition, of Section 2 of this Chapter are to be complied with.

(4) Where any defect is found during the occasional survey, the Surveyor may extend the survey as deemed necessary.

5.15.2.2 Damage surveys

(1) In the event of any sea or machinery damage which affects or may affect the class of the ship, the owner is to apply to CCS for a survey promptly so as to enable the Surveyor to ascertain the extent of the damage and necessary repairs, if any.

(2) The damage survey is to be carried out so far as necessary for fully revealing the causes and extent of the damage, generally covering damaged items and/or damage locations as well as adjacent/associated compartments, machinery and equipment.

(3) Any damage which affects the class of the ship is to be repaired according to relevant rules and with respect to the scope and extent of the damage. The scope and plan of repairs are to be such as to ensure that the condition of the ship will be so recovered that its class may be reinstated or maintained. The damage survey covers in general any damaged item affecting the class.

(4) If any damaged item, which can not be repaired immediately and thoroughly, is considered to be not affecting safety of the ship upon assessment by CCS at the request of the owner, such item may not be subject to repair for a limited period of time or may be subject to a local or suitable temporary repair plan, provided that appropriate operational restrictions in writing are signed.

5.15.2.3 Repair surveys

(1) Any repair which affects the class of the ship is to be subject to supervision by the Surveyor to ensure that any defects will be removed, the original technical condition restored and no major change made to the structure and characteristics of the ship.

(2) For any repair which affects the class of the ship, the owner or operator of the ship is to apply to CCS for survey. During any periodical survey specified in the Rules, the Surveyor is to be informed of the repairs which affect the class of the ship, if any.

(3) The repair survey is to check the defect or damage, require repairs, confirm repair plan and carry out supervision of repairs① to ensure that the repairs will be completed in compliance with the rules.

(4) Compliance of temporary repair items with the requirements for safety, reliability and restricted service is to be ensured.

(5) After completion of the repair survey, a survey report stating the nature of repairs, confirming the technical condition and making other necessary suggestions, is to be signed.

5.15.2.4 Port State control inspections

(1) Where defects are found as a result of a port State control inspection, the owner is to promptly report this to CCS and apply for an occasional survey to confirm such defects.

(2) The defects, when related to the classification certificate or the statutory certificates issued by the Society as authorized, are to be rectified and/or the necessary repair work is to be carried out within the due time.

5.15.2.5 Surveys for change of ship's name, port of registry, owner② or operator and flag

(1) When the ship's name, port of registry, owner or operator and flag is to be changed, the owner is to inform CCS of the relevant information so far as practicable in advance and apply for an occasional survey.

(2) Survey requirements

① The survey for the change of a ship's name or port of registry is in general to check the ship's names or ports of registry in relevant documents and certificates and make appropriate changes and upon confirmation of such changes, modify the classification certificate or issue a new classification certificate with the changed name or port of registry of the ship and issue a survey report accordingly.

---

① Supervision of repairs may consist of review of repair procedures, inspections and tests.

② When the owner of the ship is changed, any information related to the class of the ship is not to be provided or confirmed to any third party, unless the requesting party formally signs a written document or is authorized by the present owner.

② When the owner of a ship is changed, the existing class of the ship may be maintained provided that the new owner makes an application to CCS and accepts CCS rules and conditions of class, if any.
③ The survey for the change of a ship's flag is to confirm the ship's certificate of nationality and check the ship and its relevant documents and certificates in respect to the flag State, etc. Such surveys are to be carried out in conjunction with statutory surveys.

Section 16 ADDITIONAL REQUIREMENTS FOR HULL AND EQUIPMENT SURVEYS OF LIQUEFIED GAS CARRIERS

5.16.1 General requirements

5.16.1.1 The requirements of this Section apply to all self-propelled ships carrying liquefied gases in bulk.

5.16.1.2 The requirements of this Section apply to surveys of hull structures and piping systems, except cargo piping covered, in way of pump rooms, compressor rooms, cofferdams, pipe tunnels, void spaces and fuel oil tanks within the cargo area and all ballast tanks. The requirements are additional to the classification requirements applicable to the remainder of the ship, refer to Section 4 of this Chapter. The requirements for periodical surveys of cargo installations on ships carrying liquefied gases in bulk are given in Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk.

5.16.1.3 The requirements of this Section contain the minimum extent of examination, thickness measurements and tank testing. The survey is to be extended when substantial corrosion and/or structural defects are found and include additional close-up survey when necessary.

5.16.2 Annual surveys

5.16.2.1 General requirements

(1) The annual survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition.

(2) The annual survey is to include the items specified in 5.16.2.2 through 5.16.2.6 and in addition, the applicable items specified in 5.4.2 of this Chapter.

5.16.2.2 Examination of the hull is to include:

(1) examination of the hull plating and its closing appliances as far as can be seen;

(2) examination of watertight penetrations as far as practicable.

5.16.2.3 Examination of weather decks is to include:

(1) examination of flame screens on vents to all bunker tanks;

(2) examination of bunker and vent piping systems.

5.16.2.4 Examination of cargo pump rooms and compressor rooms and, as far as practicable, pipe tunnels if fitted, including:

(1) examination of all pump room and compressor room bulkheads for signs of leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room and compressor room bulkheads;

(2) examination of the condition of all piping systems, except cargo piping systems.

Note: For survey of air pipes, flame screens on vents and ventilators, refer to relevant requirements in Section 4 of this Chapter.

5.16.2.5 Suspect areas: Suspect areas identified at previous surveys are to be examined. Thickness measurements are to be taken of the areas of substantial corrosion and the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for these additional thickness measurements. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

5.16.2.6 Examination of ballast tanks: Examination of ballast tanks when required as a consequence of the results of the special survey and intermediate survey is to be carried out. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for these additional measurements. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

5.16.3 Intermediate surveys

5.16.3.1 General requirements

(1) The intermediate survey is to be held at or between either the 2nd or 3rd annual survey.

(2) A survey planning meeting is to be held prior to the commencement of the survey.

5.16.3.2 Ballast tanks

(1) For ships between 5 and 10 years of age, an overall survey of representative ballast tanks is to be carried out. If there is no hard protective coating, soft or semi-hard coating or POOR coating condition, the examination is to be extended to other ballast tanks of the same type.

(2) For ships over 10 years of age, an overall survey of all ballast tanks is to be carried out.

(3) If such examinations reveal no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains efficient.

(4) For ballast tanks, excluding double bottom tanks, if there is no hard protective coating, soft or semi-hard coating, or POOR coating condition and it is not renewed, the tanks in question are to be internally examined at annual intervals.

(5) When such conditions are found in double bottom ballast tanks, the tanks in question may be internally examined at annual intervals.

(6) The minimum requirements for close-up surveys at intermediate survey are given in Table 5.16.3.2(6).

Minimum Requirements for Close-Up Surveys at Hull Intermediate Surveys of Liquefied Gas Carriers **Table 5.16.3.2(6)**

10 < Age ≤ 15	Age > 15
All web frames and both transverse bulkheads in a representative ballast tank (1) and (2)	All web frames and both transverse bulkheads in two representative ballast tanks (1) and (2)
The upper part of one web frame in another representative ballast tank	
One transverse bulkhead in another representative ballast tank (2)	
(1) Complete transverse web frame including adjacent structural members. (2) Transverse bulkhead complete, including girder system and adjacent members, and adjacent longitudinal bulkhead structure. Note 1: Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted. Note 2: For areas in tanks where protective coating is found to be in GOOD condition, the extent of close-up survey may be specially considered. Note 3: For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of close-up surveys may be specially considered.① Note 4: The extent of close-up surveys may be extended by the Surveyor as deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases: ① in particular, in tanks having structural arrangements or details which have suffered defects in similar tanks, or on similar ships according to available information; ② in tanks having structures approved with reduced scantlings.	

5.16.4 Special surveys

5.16.4.1 General requirements

(1) A survey planning meeting is to be held prior to the commencement of the survey.

(2) The special survey is to include, in addition to the applicable requirements in 5.4.4 of this Chapter and 5.16.2 of this Section, examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in 5.16.4.1(4), are in a satisfactory condition and fit for the intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

(3) Ballast tanks, including double bottom tanks, pump rooms, compressor rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in 5.16.4.5 and 5.16.4.6, to ensure that the structural integrity remains effective. The examination is to be carried out to an extent sufficient to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

(4) All piping systems within the above spaces, except cargo piping systems, are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

(5) The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.

---

① The extent of the close-up survey is to be in accordance with the requirements for close-up survey of general dry cargo ships and the close-up survey of the saddle and its adjacent compartments.

5.16.4.2 Dry dock survey: A survey in dry dock is to be a part of the special survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the ballast tanks are to be carried out in accordance with the applicable requirements for special surveys, if not already performed.

5.16.4.3 Tank protection

(1) Where applicable, the condition of corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom tanks, where one of the following conditions exists, the tanks in question are to be examined at annual intervals and thickness measurements are to be carried out as deemed necessary by the Surveyor:

① a hard protective coating is found in POOR condition and it is not renewed;

② soft or semi-hard coating has been applied; or

③ a hard protective coating was not applied from time of construction.

(2) When any of the conditions described in (1) above is found in double bottom ballast tanks, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

(3) Where the hard protective coating in ballast tanks is found to be in a GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

5.16.4.4 Extent of overall and close-up survey

(1) An overall survey of all tanks and spaces, excluding fuel oil, lube oil and fresh water tanks[①], is to be carried out at each special survey.

(2) The minimum requirements for close-up surveys at special survey are given in Table 5.16.4.4(2).

(3) The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and where:

① in particular, tanks have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information;

② tanks have structures approved with reduced scantlings due to an approved corrosion control system.

(4) For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of close-up surveys according to Table 5.16.4.4(2) may be specially considered.

Minimum Requirements for Close-Up Surveys at Hull Special Surveys of Liquefied Gas Carriers

Table 5.16.4.4(2)

Special Survey No.1 (Age ≤ 5)	Special Survey No.2 (5 < Age ≤ 10)	Special Survey No.3 (Age > 10)
One web frame in a representative ballast tank of the topside, hopper side and double hull side type (1)	All web frames in a ballast tank, which is to be a double hull side tank or a topside tank. If such tanks are not fitted, another ballast tank is to be selected (1)	All web frames in all ballast tanks (1)
One transverse bulkhead in a ballast tank (3)	One web frame in each remaining ballast tank (1)	All transverse bulkheads in all ballast tanks (2)
	One transverse bulkhead in each ballast tank (2)	

(1) Complete transverse web frame including adjacent structural members.

(2) Transverse bulkhead complete, including girder system and adjacent members, and adjacent longitudinal bulkhead structure.

(3) Transverse bulkhead lower part including girder system and adjacent structural members.

Note 1: Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted.

Note 2: For areas in tanks where coatings are found to be in GOOD condition, the extent of close-up surveys may be specially considered.

Note 3: For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of close-up surveys may be specially considered.

Note 4: The Surveyor may extend the close-up survey as deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

① in particular, in tanks having structural arrangements or details which have suffered defects in similar tanks, or on similar ships according to available information;

② in tanks having structures approved with reduced scantlings.

5.16.4.5 Extent of thickness measurement

(1) The minimum requirements for thickness measurements at special survey are given in Table 5.16.4.5(1).

(2) The Surveyor may extend the thickness measurements as deemed necessary. When thickness

① For fuel oil, lube oil and fresh water tanks, reference is to be made to Table 5.4.4.2(2), Section 4 of this Chapter.

measurements indicate substantial corrosion, the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. Table 5.4.4.2(17)② may be used as guidance for these additional thickness measurements.
(3) For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurement according to Table 5.16.4.5(1) may be specially considered.
(4) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

Note 1: For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of thickness measurements may be increased to include the tank top plating at the discretion of the Surveyor.
Note 2: For areas in spaces where coatings are found to be in GOOD condition, the extent of thickness measurements may be specially considered.
Note 3: The Surveyor may extend the thickness measurements as deemed necessary. Where substantial corrosion is found, the extent of thickness measurements is to be increased to the satisfaction of the Surveyor.</td></tr>
</table>

5.16.4.6 Extent of tank testing
(1) All boundaries of ballast tanks and deep tanks used for water ballast within the cargo area are to be pressure tested. For fuel oil tanks, the representative tanks are to be pressure tested.
(2) The Surveyor may extend the tank testing as deemed necessary.
(3) Tank testing of fuel oil tanks is to be carried out with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil tanks may be specially considered by the Surveyor, based on the following:
① a satisfactory external examination of the tank boundaries; and
② a confirmation from the master stating that the pressure testing has been carried out according to the requirements with satisfactory results.
5.16.4.7 For examination of automatic air pipe heads, reference is to be made to Table 5.4.4.2(18), Section 4 of this Chapter.

Section 17 ADDITIONAL REQUIREMENTS FOR SURVEYS OF RO-RO SHIPS

5.17.1 General requirements

5.17.1.1 The requirements of this Section apply to the survey of inner and outer doors (including bow, side shell and stern doors) of ro-ro ships and other similar ships. The requirements of this Section are to be implemented for the first relevant survey commenced on or after 1 January 2012.
5.17.1.2 Special consideration may be given to the application of the relevant requirements of this Section to commercial ships owned or chartered by Governments, which are utilized in support of military operations or service.

5.17.2 Definitions

5.17.2.1 For the purpose of this Section, the relevant definitions applicable to ro-ro ships are as follows:
(1) **Ro-ro spaces**: spaces not normally sub-divided in any way and normally extending to either a

substantial length or the entire length of the ship, in which motor vehicles with fuel in their tanks for their own propulsion and / or goods (packaged or in bulk, in or on rail or road cars, vehicles (including road or rail tankers), trailers, containers, pallets, demountable tanks or in or on similar stowage units or, other receptacles) can be loaded and unloaded normally in a horizontal direction.
(2) **Special category spaces**: those enclosed vehicle spaces above or below the bulkhead deck, into and from which vehicles can be driven and to which passengers have access. Special category spaces may be accommodated on more than one deck provided that the total overall clear height for vehicles does not exceed 10 m.
(3) **Securing device**: a device used to keep the door closed by preventing it from rotating about its hinges.
(4) **Supporting device**: a device used to transmit external or internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.
(5) **Locking device**: a device that locks a securing device in the closed position.

5.17.3 Annual survey

5.17.3.1 The annual survey is to consist of an examination to verify, as far as is practicable, that the bow, inner, side shell and stern doors are maintained in a satisfactory condition.
5.17.3.2 Confirmation is to be obtained that no unapproved changes have been made to the bow, inner, side shell and stern doors since the last survey.
5.17.3.3 Documents
(1) If an Operating and Maintenance Manual (OMM) is required, it is to be verified that an approved copy is on board and any possible modifications are included.
(2) It is to be verified that documented operating procedures for closing and securing doors are kept on board and posted at an appropriate place.
(3) The Surveyor is to examine the OMM with special attention to the register of inspections and its contents as a basis for the survey.
5.17.3.4 Structural examination
Bow, inner, side shell and stern doors are to be examined with particular attention paid to:
(1) structural arrangement of doors including plating, primary structure, secondary stiffeners, hinging arms and welding;
(2) shell structure surrounding the opening of the doors and the securing, supporting and locking devices including shell plating, secondary stiffeners, primary structure, and welding;
(3) hinges and bearings, thrust bearings;
(4) hull and door side supports for securing, supporting and locking devices;
(5) close-up survey of securing, supporting and locking devices including welding, refer to Table 5.17.3.4(5).
Whenever a crack is found, an examination with NDT is to be carried out in the surrounding area and for similar items as considered necessary by the Surveyor.

Minimum Requirements for Close-Up Surveys of Doors, Locking, Securing and Supporting Devices and Fittings **Table 5.17.3.4(5)**

The following is a list of the devices and fittings and associated welding to be subject to close-up survey by the attending Surveyor.
(1) Cylinder securing pins, supporting brackets, back-up brackets (where fitted) and their welded connections
(2) Hinge pins, supporting brackets, back-up brackets (where fitted) and their welded connections
(3) Locking hooks, securing pins, supporting brackets, back-up brackets (where fitted) and their welded connections
(4) Locking pins, supporting brackets, back-up brackets (where fitted) and their welded connections
(5) Locating and stopper devices and their welded connections

5.17.3.5 Measurement of clearances
(1) Clearances of hinges, bearings and thrust bearings are to be taken, where no dismantling is required. Where the function test is not satisfactory, dismantling may be required to measure the clearances. If dismantling is carried out, a visual examination of hinge pins and bearings together with NDT of the hinge pin is to be carried out. Clearances of securing, supporting and locking devices are to be measured, where indicated in the OMM.
5.17.3.6 Sealing arrangement
(1) An examination of packing material / rubber gaskets and retaining bars or channels, including welding is to be carried out.

5.17.3.7 Drainage arrangement
(1) An examination of drainage arrangement, including bilge wells and drain pipes is to be carried out, where fitted. A test of the bilge system between the inner and outer doors is to be carried out.
5.17.3.8 Function test of doors
Checking of the operation of the bow, inner, side shell and stern doors during a complete opening and closing operation is to be made, with the results to the satisfaction of the Surveyor, as applicable, including:
(1) proper working of the hinging arms and hinges;
(2) proper engagement of the thrust bearings;
(3) device for locking the door in the open position;
(4) securing, supporting and locking devices;
(5) proper sequence of the interlock system for the opening / closing system and the securing and locking devices;
(6) mechanical lock of the securing devices;
(7) proper locking of hydraulic securing devices in the event of a loss of the hydraulic fluid, according to the procedure provided by the OMM;
(8) correct indication of open / closed position of doors and securing / locking devices at navigation bridge and other control stations;
(9) isolation of the hydraulic securing / locking devices from other hydraulic systems;
(10) confirmation that the operating panels are inaccessible to unauthorized persons;
(11) verification that a notice plate giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour is placed at each operating panel and supplemented by warning indicator lights;
(12) examination of electrical equipment for opening, closing and securing the doors.
5.17.3.9 Function test of the indicator system
Checking of the satisfactory operation of the indicator system, where fitted, is to be carried out, as applicable, including:
(1) proper visible indication and audible alarm on the navigation bridge panel, according to the selected function "harbour / sea voyage" and on the operating panel;
(2) lamp test function on both panels;
(3) verification that it is not possible to turn off the indicator light on both panels;
(4) verification of fail-safe performance, according to the procedure provided by the OMM;
(5) confirmation that power supply for indicator system is supplied by the emergency source or other secure power supply (e.g. UPS) and independent of the power supply for operating the doors;
(6) proper condition of sensors and protection from water, ice formation and mechanical damage.
5.17.3.10 Test of water leakage detection system
(1) Where fitted, the water leakage detection system is to be tested including proper audible alarm on the navigation bridge panel and on the engine control room panel, according to the procedure provided by the OMM.
5.17.3.11 Test of television surveillance system
(1) Where fitted, the television surveillance system is to be tested including proper indication on the navigation bridge monitor and on the engine control room monitor.
5.17.3.12 Tightness test
(1) A hose test or equivalent is to be carried out. If the visual examination and function test have shown satisfactory results, the tightness test of shell doors on ro-ro cargo ships need not be carried out unless considered necessary by the attending Surveyor.
5.17.3.13 NDT and thickness measurements
(1) When considered necessary by the Surveyor, NDT and thickness measurements may be required after visual examination and function test.

5.17.4 Special survey
5.17.4.1 The special survey is to include, in addition to the requirements of the annual survey as required in 5.17.3, examination, tests and checks of sufficient extent to verify that the bow, inner, side shell and stern doors, are in satisfactory condition and considered able to remain in compliance with applicable requirements, subject to proper maintenance and operation in accordance with the Operation and Maintenance Manual (OMM) or the manufacturer's recommendations and the periodical surveys being carried out at the due dates for the five year period until the next special survey.
5.17.4.2 The examinations of the doors are to be supplemented by thickness measurements① and testing

① Corrosion criteria of doors are in accordance with corrosion criteria of adjacent structures.

to verify compliance with applicable requirements so that the structural and weathertight integrity remain effective. The aim of the examination is to identify corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

5.17.4.3 The bow, inner, side shell and stern doors are to be surveyed as follows:

(1) A survey of the items listed in 5.17.3.4, including close-up survey of securing, supporting and locking devices, together with welding, is to be carried out, refer to Table 5.17.3.4(5).

(2) Non-destructive testing and thickness measurements are to be carried out on securing, supporting and locking devices, to the extent considered necessary by the Surveyor. Whenever a crack is found, an examination with NDT is to be carried out in the surrounding area and for similar items as considered necessary by the Surveyor.

(3) The maximum thickness diminution of hinging arms, securing, supporting and locking devices is to be treated according to the normal procedure for primary structures, but is not to be more than 15% of the as-built thickness. Certain designs may be subject to special consideration of CCS.

(4) Checking the effectiveness of sealing arrangements by hose testing or equivalent is to be carried out.

(5) Clearances of hinges, bearings and thrust bearings are to be taken. Unless otherwise specified in the OMM or by the manufacturer's recommendation, the measurement of clearances on ro-ro cargo ships may be limited to representative bearings where dismantling is needed in order to measure the clearances.

If dismantling is carried out, a visual examination of hinge pins and bearings together with NDT of the hinge pin is to be carried out.

(6) The non-return valves of the drainage system are to be dismantled and examined.

Section 18 ADDITIONAL REQUIREMENTS FOR SURVEYS OF LIVESTOCK CARRIERS

5.18.1 General requirements

5.18.1.1 In addition to applicable survey items in Section 4 of this Chapter, livestock carriers are to satisfy relevant provisions of this Section.

5.18.2 Annual survey

5.18.2.1 Confirmation is to be obtained that no unapproved changes have been made to hull structures of livestock carriers, livestock pens, passageways as well as the arrangement and protection of livestock since the last survey; confirming that passageways and exits of the escape route of pen area are unblocked; confirming that two means of egress in each livestock space are not separated by the pen or other obstructions.

5.18.2.2 Checking that special requirements for the stability of livestock carriers are included in the approved stability information.

5.18.2.3 Confirming that ventilation pipings of livestock space are intact and the operation of fans, including fan starters, failure indicators and alarms at different positions is normal. If only one fan is provided, confirmation is to be obtained that spare parts are adequate.

5.18.2.4 Confirming that fodder and drinking water supply, fresh water supply system, water washing system and sewage drainage and discharge system of livestock space are in good condition. The fodder tanks and the fresh water tanks of at least two livestock spaces are to be internally examined.

5.18.2.5 Confirming that all fire hydrants and fire hose connections arranged in the pen area have the same diameter.

5.18.2.6 Checking the instructions for the changeover between main and secondary sources of power and vice-versa and confirming the function of the changeover between main and secondary sources of power and vice-versa.

5.18.2.7 Visual examination of lamp casings on light fittings for the livestock space.

5.18.3 Special survey

5.18.3.1 The special survey is to include, in addition to the requirements of 5.18.2, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping are in a satisfactory condition.

5.18.3.2 All fresh water pumps, sewage pumps and system components are to be opened up and examined.

5.18.3.3 Performance test of fodder system, fresh water supply system, water washing system and sewage drainage and discharge system.

5.18.3.4 The motor of fan in the livestock space together with its control and operational mechanism are to be inspected and if necessary, operationally tested in working condition.

5.18.3.5 Interlocking devices of fan starters in the livestock space are to be tested.

5.18.3.6 Means of access for livestock to and from the ship is to be load tested in accordance with the requirements of 2.2.4, Section 2, Chapter 2, PART EIGHT of the Rules.

Appendix 1 CRITERIA FOR RENEWAL OF HULL STRUCTURAL MEMBERS

This Appendix does not apply to the ships constructed in accordance with Common Structural Rules① and CCS Rules for Structures of Container Ships.

1 Criteria for longitudinal strength

1.1 For ships of 65 m and over in length, the hull girder section modulus at deck and bottom within 0.4 *L* amidships is not to be less than 0.9 times the hull girder section modulus required in the Rules.

1.2 The criteria for longitudinal strength for hull girders of oil tankers of 130 m in length and upwards are given in Appendix 2 of this Chapter.

2 Criteria for local strength

2.1 For a ship constructed in accordance with CCS rules and the keel of which was laid before 15 January 1983, the renewal thickness of hull plating and structural members is not to be less than the value obtained by multiplying their as-built thickness and the relevant percentage shown in Table 2.1 below:

Table 2.1

Structural member	Minimum renewal thickness		
	Unrestricted service	Service category 1	Service categories 2 and 3
Strength deck, side and bottom shell	75%	70%	65%
Continuous longitudinal strength members and web frames	75%	70%	65%
Foundations of main engines, cranes and windlasses	75%	75%	75%
Other structural members defined in the Rules	70%	60%	55%

2.2 For a ship constructed in accordance with CCS rules and the keel of which was laid on or after 15 January 1983, the renewal thickness of hull plating and structural members is not to be less than the value obtained by multiplying their as-built thickness and the relevant percentage shown in Table 2.2 below:

Table 2.2

Structural member	Minimum renewal thickness	
	$L \geq 90$ m	$L < 90$ m
① Strength deck plating, side shell, top strake, bilge strake, bottom shell, flat plate keel, inner bottom, continuous longitudinal bulkhead, hopper tank and topside tank plating. ② Main longitudinal continuous members, e.g. deck girders, hatch side girders, side girders, bottom girders, bulkhead girders, continuous hatch coamings. ③ Main transverse members, e.g. side frame webs, deck transverses, double plate floors, bulkhead webs, watertight and oiltight transverse bracket plates. ④ Transverse bulkhead plating in holds, upper and lower bulkhead stool sloping plating, watertight bulkhead plating in deep tanks	80%	75%
Other plating and members, e.g. deck within line of openings, deck longitudinals, side longitudinals, bottom longitudinals, inner bottom longitudinals, bulkhead longitudinals, face plates of side frames, brackets of structural members, hatch covers, non-continuous hatch coamings, sea chests	75%	70%
Note: For bulk carriers designed in accordance with the Rules and assigned the class notations of "Strengthened for Heavy Cargoes" and "Grab* (×)", the minimum renewal thickness of inner bottom may be taken as the value obtained by multiplying the as-built thickness and 75%		

2.3 For a ship constructed in accordance with the Rules and the scantlings of which as required by the Rules are indicated in their plans, or for a ship the scantlings of which are to be assessed in accordance with the Rules, the renewal thickness of hull plating and structural members is not to be less than the value obtained by multiplying the thickness specified in the Rules and the relevant percentage shown in Table 2.2 above.

2.4 For bulk carriers of 150 m in length and upwards, contracted for construction on or after 1 July 1998

① PART NINE or TEN of the Rules (2012 version) and its 2013 and 2014 amendments or PART NINE of the Rules (2015 version) and its subsequent versions (including amendments).

and carrying solid bulk cargoes having a density of 1.0 t/m^3 and above, steel renewal is required where the gauged thickness of watertight corrugated bulkheads is less than t_{net} + 0.5 mm and coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, with t_{net} being net thickness and obtained in accordance with Section 9, Chapter 8 of PART TWO of the Rules, except for:

(1) double skin bulk carriers the keels of which were laid or which were at a similar stage of construction before 1 July 1999;

(2) double skin bulk carriers the keels of which were laid or which were at a similar stage of construction before 1 January 2000, with distance between inner and outer skins being not less than 760 mm;

(3) double skin bulk carriers the keels of which were laid or which were at a similar stage of construction after 1 January 2000, with distance between inner and outer skins being not less than 1,000 mm.

2.5 For bulk carriers contracted for construction on or after 1 July 1998 and complying with Section 11, Chapter 8, PART TWO of the Rules, steel renewal is required where the gauged thickness of hatch covers is less than t_{net} + 0.5 mm. Where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. For internal members of double skin hatch covers, steel renewal is required where the gauged thickness is less than t_{net} or the Surveyor deems it necessary based on the corrosion or deformation. t_{net} is net thickness and to be obtained in accordance with Section 11, Chapter 8 of PART TWO of the Rules.

For bulk carriers, ore carriers and combination carriers① contracted for construction on or after 1 January 2004 and complying with Section 11, Chapter 8, PART TWO of the Rules, steel renewal is required where the gauged thickness is less than t_{net} + 0.5 mm for single skin hatch cover and double skin hatch cover platings, hatching coamings and coaming stays. Where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. For internal members of double skin hatch covers, thickness measurement is required when CCS Surveyor deems it necessary based on the corrosion or deformation. Where the gauged thickness is less than t_{net}, the internal structure is to be renewed.

2.6 For ships other than bulk carriers, ore carriers and combination carriers, contracted for construction on or after 1 July 2012 and complying with Section 20, Chapter 2, PART TWO of the Rules②, and for all weathertight steel cargo hatch covers on exposed decks, steel renewal is required where the gauged thickness of the plating of double skin hatch covers, single skin hatch covers, hatch coamings, coaming stays and stiffeners is less than t_{net} + 0.5 mm. Where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, coating③ or annual gauging may be adopted as an alternative to steel renewal. For the internal structure of double skin hatch covers, thickness gauging is required when hatch cover top or bottom plating renewal is to be carried out or when deemed necessary, at the discretion of CCS Surveyor, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required where the gauged thickness is less than t_{net}. For corrosion addition t_S = 1.0 mm, the thickness for steel renewal is t_{net}, and when gauged thickness is between t_{net} and t_{net} + 0.5 mm, coating or annual gauging may be adopted as an alternative to steel renewal, where t_{net} being the net thickness, to be calculated in accordance with 2.20.2, Section 20, Chapter 2, PART TWO of the Rules.

2.7 For all weathertight steel cargo hatch covers on exposed decks of ships contracted for construction on or after 1 July 2024, steel renewal is required where the gauged thickness of the plating of double skin hatch covers, single skin hatch covers, hatch coamings, coaming stays and stiffeners is less than t_{net} + 0.5 mm. Where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, coating④ or annual gauging may be adopted as an alternative to steel renewal. For the internal structure of double skin hatch covers, thickness gauging is required when hatch cover top or bottom plating renewal is to be carried out or when deemed necessary, at the discretion of CCS Surveyor, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required where the gauged thickness is less than t_{net}. For corrosion addition t_s = 1.0 mm, the thickness for steel renewal is t_{net}, and when gauged thickness is between t_{net} and t_{net} + 0.5 mm, coating or annual gauging may be adopted as an alternative to steel renewal, where t_{net} being the net thickness, to be calculated in accordance with 2.20.2, Section 20, Chapter 2, PART TWO of the Rules.

---

① Bulk carriers, ore carriers and combination carriers are defined in Appendix 2, Chapter 2 of this PART.

② For the definitions of bulk carriers, ore carriers and combination carriers, refer to Appendix 2, Chapter 2 of this PART.

③ Coating is to be maintained in GOOD condition, as defined in 5.1.5.1(15) of this Chapter.

④ Coating is to be maintained in GOOD condition, as defined in 5.1.5.1(15) of this Chapter.

2.8 For the following bulk carriers of 150 m in length and upwards and carrying solid bulk cargoes having a density of 1.78 t/m^3 and above, steel renewal is required where the gauged thickness of transverse watertight corrugated bulkheads between cargo holds Nos.1 and 2 is less than t_{net} + 0.5 mm and coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, with t_{net} being calculated in accordance with IACS UR S19:

(1) bulk carriers contracted for construction before 1 July 1998 and not complying with IACS UR S18;

(2) bulk carriers the keels of which were laid or which were at a similar stage of construction before 1 July 1999 and not complying with IACS UR S18.

2.9 For bulk carriers which were not built in accordance with Section 3, Chapter 8 of PART TWO of the Rules, steel renewal is required where the gauged thickness of side shell frames of cargo holds is less than t_{REN} mm. Where the gauged thickness is within the range t_{REN} mm and t_{COAT} mm, sand blasting, coating and reinforcements are to be done and the coating is to be maintained in "as-new" or an equivalent condition (i.e. without breakdown or rusting) at special and intermediate surveys. The t_{REN} and t_{COAT} above are to be calculated in accordance with IACS UR S31.

2.10 For Polar Class ships, steel renewal is required where the shell plating corrosion/abrasion additions within the ice-strengthened hull areas is greater than the value specified in Table 13.2.11.2, Chapter 13, PART EIGHT of the Rules minus 0.5 mm.

Appendix 2 CRITERIA FOR LONGITUDINAL STRENGTH OF HULL GIRDER FOR OIL TANKERS

1 General requirements

1.1 These criteria are to be used for the evaluation of longitudinal strength of the ship's hull girder as required by 5.6.1.3 of Section 6, Chapter 5 of this PART.

1.2 In order that ship's longitudinal strength to be evaluated can be recognized as valid, fillet welding between longitudinal internal members and hull envelopes are to be in sound condition so as to keep integrity of longitudinal internal members with hull envelopes.

2 Evaluation of longitudinal strength

On oil tankers of 130 m in length and upwards and of over 10 years of age, the longitudinal strength of the ship's hull girder is to be evaluated in compliance with the requirements of this Appendix on the basis of the thickness measured, renewed or reinforced, as appropriate, during the special survey.

The condition of the hull girder for longitudinal strength evaluation is to be determined in accordance with the methods specified in Annex 3 of this Appendix.

2.1 Calculation of transverse sectional areas of deck and bottom flanges of hull girder

2.1.1 The transverse sectional areas of deck flange (deck plating and deck longitudinals) and bottom flange (bottom shell plating and bottom longitudinals) of the ship's hull girder are to be calculated by using the thickness measured, renewed or reinforced, as appropriate, during the special survey.

2.1.2 If the diminution of sectional areas of either deck or bottom flange exceeds 10% of their respective as-built area (i.e. original sectional area when the ship was built), either one of the following measures is to be taken:

(1) to renew or reinforce the deck or bottom flanges so that the actual sectional area is not less than 90% of the as-built area; or

(2) to calculate the actual section moduli (Z_{act}) of transverse section of the ship's hull girder by applying the calculation method specified in Annex 1 of this Appendix, by using the thickness measured, renewed or reinforced, as appropriate, during the special survey.

2.2 Requirements for transverse section modulus of hull girder

2.2.1 The actual section moduli of transverse section of the ship's hull girder calculated in accordance with 2.1.2(2) above is to satisfy either of the following provisions, as applicable:

(1) for ships constructed on or after 1 July 2002, the actual section moduli (Z_{act}) of the transverse section of the ship's hull girder calculated in accordance with the requirements of 2.1.2(2) above is not to be less than the diminution limits determined by CCS①; or

(2) for ships constructed before 1 July 2002, the actual section moduli (Z_{act}) of the transverse section of the ship's hull girder calculated in accordance with the requirements of 2.1.2(2) above is to meet the criteria for minimum section modulus for ships in service required by CCS, provided that in no case Z_{act} is to be less than the diminution limit of the minimum section modulus (Z_{mc}) as specified in Annex 2 of this Appendix.

---

① The actual transverse section modulus of the hull girder of oil tankers calculated under paragraph 2.2.1(1) of this Appendix is not to be less than 90% of the required section modulus for new buildings specified in IACS Unified Requirements S7(C = 1.0 C_n is to be used for the purpose of this calculation.) or S11, whichever is the greater.

Annex 1
Calculation Criteria of Section Moduli of Midship Section of Hull Girder

1. When calculating the transverse section modulus of the ship's hull girder, the sectional area of all continuous longitudinal strength members is to be taken into account.
2. Large openings, i.e. openings exceeding 2.5 m in length (along ship's length) or 1.2 m in breadth and scallops, where scallop welding is applied, are always to be deducted from the sectional areas used in the section modulus calculation.
3. Smaller openings (manholes, lightening holes, single scallops in way of seams, etc.) need not be deducted provided that the sum of their breadths or shadow area breadths in one transverse section does not reduce the section modulus at deck or bottom by more than 3% and provided that the height of lightening holes, draining holes and single scallops in way of seams in longitudinals or longitudinal girders does not exceed 25% of the web depth, for scallops maximum 75 mm.
4. A deduction-free sum of smaller opening breadths in one transverse section in the bottom or deck area of 0.06 ($B - \sum b$) (where B = breadth of ship, $\sum b$ = total breadth of large openings) may be considered equivalent to the above reduction in sectional modulus.
5. The shadow area will be obtained by drawing two tangent lines with an opening angle of 30°.
6. The deck modulus is related to the moulded strength deck line at side.
7. The bottom modulus is related to the base line.
8. Continuous trunks and longitudinal hatch coamings are to be included in the longitudinal sectional area provided they are effectively supported by longitudinal bulkheads or deep girders. The deck modulus is then to be calculated by dividing the moment of inertia by the following distance, provided this is greater than the distance from neutral axis to the deck line at side:

$$y_t = y\left(0.9 + 0.2\frac{x}{B}\right)$$

where:

y = distance from neutral axis to top of continuous strength member,
x = distance from top of continuous strength member to centreline of the ship.
x and y to be measured to the point giving the largest value of y_t.

9. Longitudinal girders between multi-hatchways will be considered by special calculations.

Annex 2
Diminution Limit of Minimum Longitudinal Strength of Oil Tankers in Service

1 The diminution limit of the minimum section modulus (Z_{mc}) of oil tankers in service is given by the following formula:

$$Z_{mc} = cL^2B(C_b + 0.7)k \quad \text{cm}^3$$

where: L = Length of ships. L is the distance, in m, on the summer load waterline from the fore side of stem to the after side of the rudder post, or the centre of the rudder stock if there is no rudder post. L is not to be less than 96%, and need not be greater than 97%, of the extreme length on the summer load waterline. In ships with unusual stern and bow arrangement the length L may be specially considered;

B = Greatest moulded breadth in metres;

C_b = Moulded block coefficient at draught d corresponding to summer load waterline, based on L and B. C_b is not to be taken less than 0.60:

$$C_b = \frac{\text{moulded displacement (m}^3\text{) at draught } d}{LBd}$$

$$C = 0.9\, c_n$$

$$c_n = 10.75 - \left(\frac{300 - L}{100}\right)^{1.5} \quad \text{for } 130 \text{ m} \le L \le 300 \text{ m}$$

c_n = 10.75, for 300 m < L < 350 m

$$c_n = 10.75 - \left(\frac{L - 350}{150}\right)^{1.5} \quad \text{for } 350 \text{ m} \le L \le 500 \text{ m};$$

k = material factor, e.g.:
k = 1.0 for mild steel with yield stress of 235 N/mm^2 and over;
k = 0.78 for high tensile steel with yield stress of 315 N/mm^2 and over;
k = 0.72 for high tensile steel with yield stress of 355 N/mm^2 and over.

2 Scantlings of all continuous longitudinal members of the ship's hull girder based on the section modulus requirement in 1 above are to be maintained within 0.4L amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the end of 0.4L part, bearing in mind the desire not to inhibit the ship's loading flexibility.

3 However, the above standard may not be applicable to ships of unusual type or design, e.g. for ships of unusual main proportions and/or weight distributions.

Annex 3
Sampling Method of Thickness Measurements for Longitudinal Strength Evaluation and Repair Methods

1 Extent of longitudinal strength evaluation
1.1 Longitudinal strength is to be evaluated within 0.4L amidships for the extent of the hull girder length that contains tanks therein and within 0.5L amidships for adjacent tanks which may extend beyond 0.4L amidships.
1.2 The tanks in this Annex mean ballast tanks and cargo tanks.

2 Sampling method of thickness measurement
2.1 Pursuant to the requirements of 5.6.4.4 of this Chapter, transverse sections are to be chosen such that thickness measurements can be taken for as many different tanks in corrosive environments as possible, e.g. ballast tanks sharing a common plane boundary with cargo tanks fitted with heating coils, other ballast tanks, cargo tanks permitted to be filled with seawater and other cargo tanks. Ballast tanks sharing a common plane boundary with cargo tanks fitted with heating coils and cargo tanks permitted to be filled with seawater are to be selected where present.
2.2 The minimum number of transverse sections to be sampled is to be in accordance with Table 5.6.4.4(1) of this Chapter. The transverse sections are to be located where the largest thickness reductions are suspected to occur or are revealed from deck and bottom plating measurements and are to be clear of areas which have been locally renewed or reinforced.
2.3 At least two points are to be measured on each deck plate and/or bottom shell plate required to be measured within the cargo area in accordance with the requirements of Table 5.6.4.4(1) of this Chapter.
2.4 Within 0.1D (where D is the ship's moulded depth) of the deck and bottom at each transverse section to be measured in accordance with the requirements of Table 5.6.4.4(1) of this Chapter, every longitudinal and girder are to be measured on the web and face plate, and every plate is to be measured at one point between longitudinals.
2.5 For longitudinal members other than those specified in 2.4 to be measured at each transverse section in accordance with the requirements of Table 5.6.4.4(1) of this Chapter, every longitudinal and girder are to be measured on the web and face plate, and every plate is to be measured at least in one point per strake.
The thickness of each component is to be determined by averaging all of the measurements taken in way of the transverse section on each component.

3 Additional measurements where the longitudinal strength is deficient
3.1 Where one or more of the transverse sections are found to be deficient in respect of the longitudinal strength requirements given in this annex, the number of transverse sections for thickness measurement is to be increased such that each tank within the 0.5L amidships region has been sampled.
3.2 Additional thickness measurements are also to be performed on one transverse section forward and one aft of each repaired area to the extent necessary to ensure that the areas bordering the repaired section also comply with the requirements of Section 6 of this Chapter.

4 Effective repair methods
4.1 The extent of renewal or reinforcement carried out to comply with this Annex is to be in accordance with 4.2.

4.2 The minimum continuous length of a renewed or reinforced structural member is to be not less than twice the spacing of the primary members in way. In addition, the thickness diminution in way of the butt joint of each joining member forward and aft of the replaced member (plates, stiffeners, girder webs and flanges, etc.) is not to be within the substantial corrosion range (75% of the allowable diminution associated with each particular member). Where differences in thickness at the butt joint exceed 15% of the lower thickness, a transition taper is to be provided.

4.3 Alternative repair methods involving the fitting of straps or structural member modification are to be subject to special consideration. In considering the fitting of straps, it is to be limited to the following conditions:

(1) to restore and/or increase longitudinal strength;

(2) the thickness diminution of the deck or bottom plating to be reinforced is not to be within the substantial corrosion range (75% of the allowable diminution associated with the deck plating);

(3) the alignment and arrangement, including the termination of the straps, is in accordance with a standard recognized by CCS;

(4) the straps are continuous over the entire 0.5*L* amidships length; and

(5) continuous fillet welding and full penetration welds are used at butt welding and, depending on the width of the strap, slot welds. The welding procedures applied are to be acceptable to CCS.

4.4 The existing structure adjacent to replacement areas and in conjunction with the fitted straps, etc., is to be capable of withstanding the applied loads, taking into account the buckling resistance and the condition of welds between the longitudinal members and hull envelope plating.

Appendix 3 GUIDELINES FOR MEASURING SCANTLINGS OF THE TRANSVERSE WATERTIGHT VERTICALLY CORRUGATED BULKHEAD BETWEEN CARGO HOLDS NOS.1 AND 2 OF BULK CARRIERS

1 For verification that UR S19 is complied with, measurement is necessary to determine the general condition of the structure and the scope of possible repairs and/or reinforcement of transverse watertight vertically corrugated bulkheads.

2 In UR S19, the applicable buckling pattern is taken into account for evaluation of bulkhead strength and this is to determine the thickness reduction under the standard critical condition shown in Figure 2(1) and Figure 2(2).

3 The horizontal lines defined below are to be measured. The scantlings of each separate vertical corrugation, corrugation flange, web, shedder plate and gusset plate within each horizontal line given below are to be measured and properly evaluated.

— Horizontal line *a* without bottom stool, see Figure 2(1):

Location:

(1) half of the width of the corrugation flange approx. 200 mm above shedder plate line;
(2) center of gusset plate between corrugation flanges, if fitted;
(3) center of shedder plate;
(4) half of the center of the corrugation web approx. 200 mm above shedder plate line.

— Horizontal line *b* with bottom stool, see Figure 2(2):

Location:

(1) half of the width of the corrugation flange approx. 200 mm above shedder plate line;
(2) center of gusset plate between corrugation flanges, if fitted;
(3) center of shedder plate;
(4) half of the center of the corrugation web approx. 200 mm above shedder plate line.

— Horizontal line *c* with or without bottom stool, see Figure 2(1) and Figure 2(2):

Location:

(1) half of the width of the corrugation web and corrugation flange approx. in way of half height of corrugation.

4 Where thickness of plates along the horizontal line is different, the thinner ones are to be measured.

5 Steel renewal and/or reinforcement is to be in compliance with the requirements in UR S19.

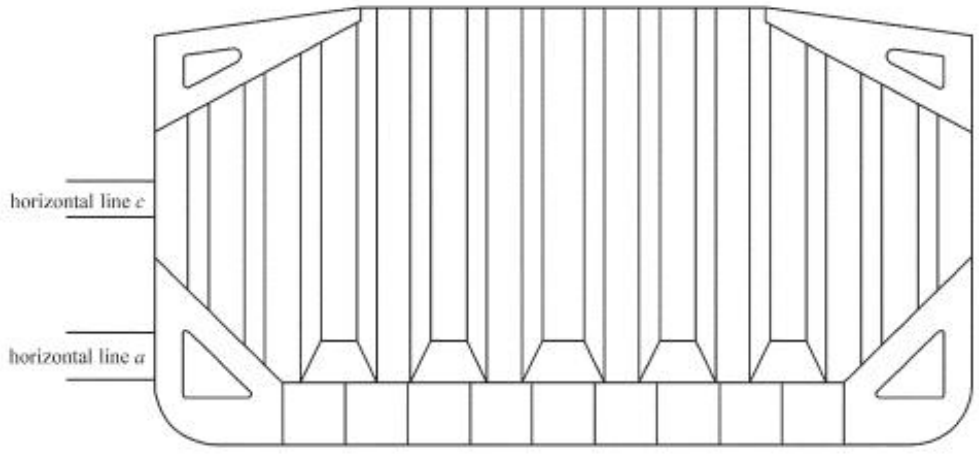

Figure 2(1)

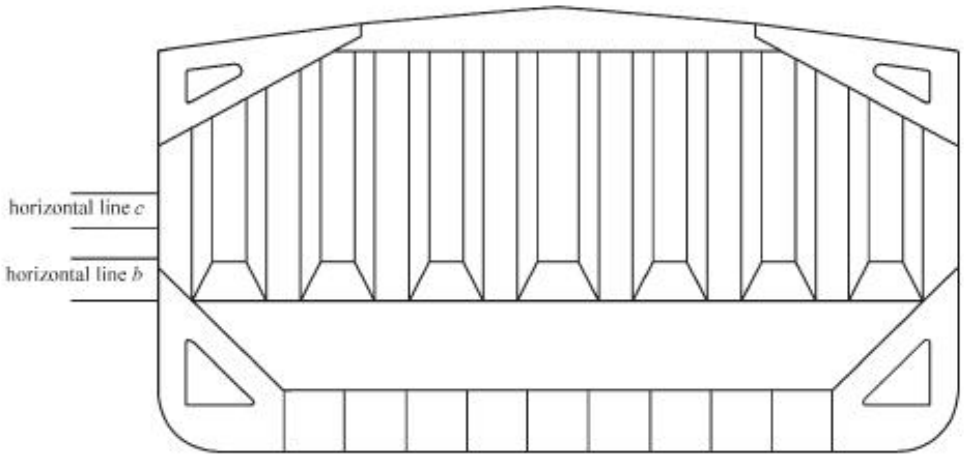

Figure 2(2)

Appendix 4 RUDDER BEARING WEAR CLEARANCE

The following values of rudder bearing wear clearance are provided for reference to owners for the purpose of facilitating their repairs.

Wear Clearance Limit for Lower Bearings of Double Bearing Rudders (mm)

Diameter of rudder stock	Rudder bearings made of copper or bearing alloy	Rudder bearings made of lignum vitae or compreg	Rudder bearings made of synthetic resin ①
≤ 80	3.00	3.50	3.00
> 80 ~ 120	4.00	4.50	4.00
> 120 ~ 180	5.00	6.00	5.00
> 180 ~ 250	6.00	7.00	6.00
> 250 ~ 315	7.00	7.50	7.00
> 315 ~ 400	7.50	8.00	8.00
> 400 ~ 500	8.00	9.00	9.00
> 500 ~ 630	9.00	10.00	10.00
> 630 ~ 800	10.00	11.00	11.00

Notes: ① Nylon or equivalent material, excluding saran.

② For wear clearance limit relating to renewal of rudders made of saran, refer to manufacturers' instructions. Where no such instructions are available, refer to the requirements for rudders made of lignum vitae or compreg.

③ Wear clearance limit of lower bearing of spade rudders is to be 70% of the value shown in the above table.

Wear Clearance Limit for Upper Pintle Bearings of Double Bearing Rudders (mm)

Diameter of rudder pintle	Pintle bearings made of copper or bearing alloy	Pintle bearings made of lignum vitae or compreg	Pintle bearings made of synthetic resin
≤ 80	3.00	3.50	3.00
> 80 ~ 120	4.00	4.50	4.00
> 120 ~ 180	5.00	5.50	5.00
> 180 ~ 250	6.00	6.50	6.00
> 250 ~ 315	7.00	7.50	6.50
> 315 ~ 400	7.50	8.00	7.00
> 400 ~ 500	8.00	9.00	8.00

Wear Clearance Limit for Pintle Bearings of Multi-pintle Rudders (mm)

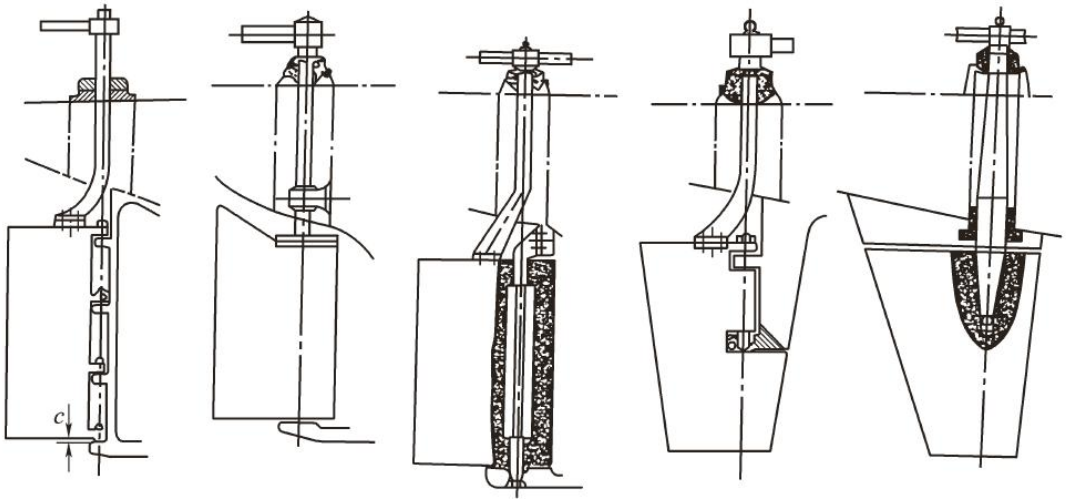
Diameter of rudder pintle	Pintle bearings made of copper or bearing alloy	Pintle bearings made of lignum vitae or compreg	Pintle bearings made of synthetic resin
≤ 50	4.00	4.50	4.20
> 50 ~ 80	5.00	5.50	5.24
> 80 ~ 120	6.00	6.50	7.35
> 120 ~ 180	7.00	7.50	7.35
> 180 ~ 250	8.00	8.50	8.40
> 250 ~ 315	8.50	9.00	8.43
> 315 ~ 400	9.00	9.50	9.45
> 400 ~ 500	10.00	10.50	10.50

Wear Clearance Limit for Pintle Bearings of Semi-Spade Rudders with Two Heel Pintles (mm)

Diameter of rudder pintle	Pintle bearings made of copper or bearing alloy	Rudder bearings made of lignum vitae or compreg	Rudder bearings made of synthetic resin
≤ 50	3.50	4.00	4.00
> 50 ~ 80	4.00	4.50	4.50
> 80 ~ 120	5.00	5.50	5.50
> 120 ~ 180	6.00	6.50	6.50
> 180 ~ 250	7.00	7.50	7.50
> 250 ~ 315	8.00	8.50	8.50
> 315 ~ 400	9.00	9.50	9.50
> 400 ~ 500	10.00	10.00	10.00

Wear Clearance Limit for Bearings of Rudders with Shaft (mm)

Diameter of rudder stock	Rudder bearings made of copper or bearing alloy	Rudder bearings made of lignum vitae or compreg	Rudder bearings made of synthetic resin
≤ 80	3.50	4.00	3.75
> 80 ~ 120	4.00	5.00	4.50
> 120 ~ 180	5.00	6.00	5.50
> 180 ~ 250	6.50	7.00	6.75
> 250 ~ 315	7.50	8.00	7.75
> 315 ~ 400	8.50	9.00	8.75
> 400 ~ 500	9.50	10.00	9.75



Multi-pintle rudder | Double bearing rudder | Rudder with shaft | Semi-spade rudder with two heel pintles | Spade rudder

Appendix 5 WEAR CLEARANCE OF BEARINGS OF PROPELLER SHAFTS OR TUBE SHAFTS

The wear clearance of bearings of propeller shafts or tube shafts is generally not to be more than that as given in the following Table.

Shaft diameter *d*	Clearance limit (mm)			
	Bearing made of white metal	Bearing made of lignum vitae	Plate-reinforced rubber bearing	Block-cast rubber bearing
≤ 100	1.80	3.50	3.50	3.50
> 100 ~ 120	2.00	4.00	4.00	4.00
> 120 ~ 150	2.20	4.50	4.50	5.00
> 150 ~ 180	2.40	5.00	5.00	–
> 180 ~ 220	2.60	5.50	5.50	–
> 220 ~ 260	2.80	6.00	6.00	–
> 260 ~ 310	3.00	6.60	6.50	–
> 310 ~ 360	3.20	7.30	7.20	–
> 360 ~ 440	3.50	8.00	7.80	–
> 440 ~ 500	3.80	8.70	8.50	–
> 500 ~ 600	4.10	9.50	9.00	–
> 600 ~ 700	4.50	10.50	10.00	–

Note: ① For low-speed shafting (n < 150 r/min), wear clearance limit for white metal bearings is to be 20% more than the value shown in the above table.

Appendix 6 GUIDELINES FOR THE GAUGING OF SIDE SHELL FRAMES AND BRACKETS IN SINGLE SIDE SKIN BULK CARRIERS REQUIRED TO COMPLY WITH UR S31

1 General

Gauging is necessary to determine the general condition of the structure and to define the extent of possible steel renewals or other measures for the webs and flanges of side shell frames and brackets for verification of the compliance with UR S31.

2 Zones of side shell frames and brackets

For the purpose of steel renewal, sand blasting and coating, four zones A, B, C and D are defined, as shown in Figure 2. Zones A & B are considered to be the most critical zones.

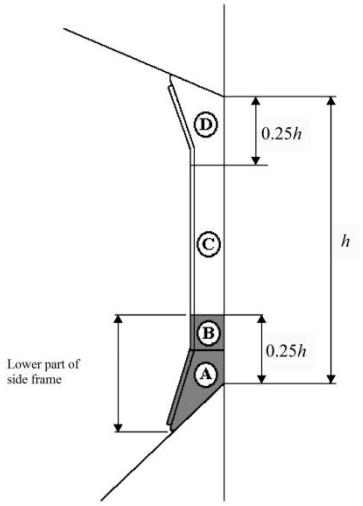


Figure 2 Zones of Side Shell Frames and Brackets

3 Pitting and grooving

—— Pits can grow in a variety of shapes, some of which would need to be ground before assessment.

—— Pitting corrosion may be found under coating blisters, which must be removed before inspection.

—— To measure the remaining thickness of pits or grooving, the normal ultrasonic transducer (generally 10 mm diameter) will not suffice. A miniature transducer (3 to 5 mm diameter) must be used. Alternatively the gauging firm must use a pit gauge to measure the depth of the pits and grooving and calculate the remaining thickness.

3.1 Assessment based upon area

This is the method specified in S31.2.5 and is based upon the intensity determined from Figure 3.1.

If pitting intensity is higher than 15% in an area (see Figure 2), then thickness measurements are to be taken to check the extent of the pitting corrosion. The 15% is based upon pitting or grooving on only one side of the web.

In cases where pitting is evident as defined above (exceeding 15%), then an area of 300 mm diameter or more (or, where this is impracticable on the frame flange or the side shell, hopper tank plating or topside tank plating attached to the side frame, an equivalent rectangular area), at the most pitted part, is to be cleaned to bare metal, and the thickness measured in way of the five deepest pits within the cleaned area. The least thickness measured in way of any of these pits is to be taken as the thickness to be recorded.

The minimum acceptable remaining thickness in any pit or groove is equal to:

—— 75% of the as-built thickness, for pitting or grooving in the cargo hold side frame webs and flanges;

—— 70% of the as-built thickness, for pitting or grooving in the side shell, hopper tank and topside tank plating attached to the cargo hold side frame, over a width up to 30 mm from each side of it.

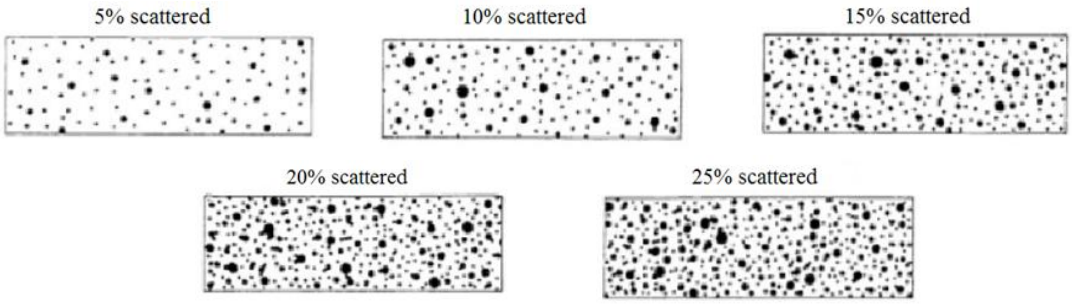

Figure 3.1 Pitting Intensity Diagrams (from 5% to 25% intensity)

4 Gauging methodology

Numbers of side frames to be measured are equivalent to those of special survey or intermediate survey corresponding to the ship's age. Representative thickness measurements are to be taken for each zone as specified below.

Special consideration to the extent of the thickness measurements may be given by CCS, if the structural members show no thickness diminution with respect to the as built thicknesses and the coating is found in "as-new" condition (i.e., without breakdown or rusting).

Where gauging readings close to the criteria are found, the number of hold frames to be measured is to be increased.

If renewal or other measures according to S31 are to be applied on individual frames in a hold, then all frames in that hold are to be gauged.

There is a variety of construction methods used for side shell frames in bulk carriers. Some have faceplates (T sections) on the side shell frames, some have flanged plates and some have bulb plates. The use of faceplates and flanged sections is considered similar for gauging purposes in that both the web and faceplate or web and flange plate are to be gauged. If bulb plate has been used, then web of the bulb plate is to be gauged in the normal manner and the sectional modulus has to be specially considered if required.

4.1 Gaugings for zones A, B & D

Web plating: The gauging pattern for zones A, B & D is to be a 5-point pattern. See Figure 4.1. The 5-point pattern is to be over the depth of the web and the same area vertically. The gauging report is to reflect the average reading.

4.2 Gaugings for zone C

Web plating: Depending upon the condition of the web in way of zone C, the web may be measured by taking 3 readings over the length of zone C and averaging them. The average reading is to be compared with the allowable thickness. If the web plating has general corrosion, then this pattern is to be expanded to a 5-point pattern as noted above.

4.3 Gaugings for sections a) and b) (flanges and side shell plating)

Where the lower bracket length or depth does not meet the requirements in UR S12(Rev. 3), gaugings are to be taken at sections a) and b) to calculate the actual section modulus required in UR S31.3.4. See Figure 4.3. At least 2 readings on the flange/faceplate are to be taken in way of each section. At least one reading of the attached shell plating is to be taken on each side of the frame (i.e. fore and aft) in way of sections a) and section b).

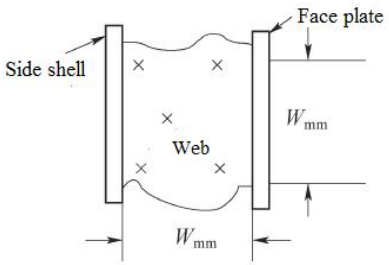

Figure 4.1 Typical 5-point pattern on the web plate

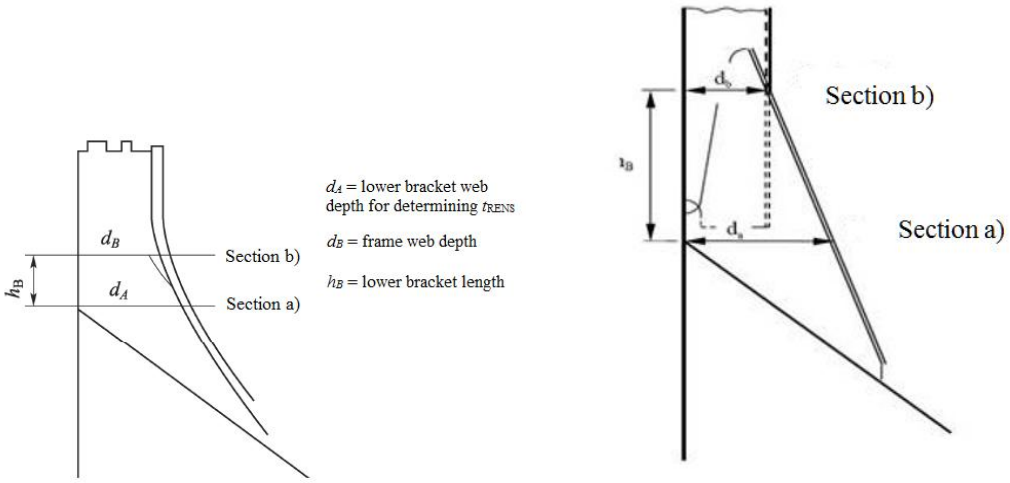

Figure 4.3 Sections a) and b)

Appendix 7 GUIDELINES FOR THE SURVEY OF VOYAGE REPAIRS

1 Purpose

1.1 The purpose of these notes is to provide guidance to CCS field Surveyors in dealing with voyage repairs, including repairs during voyage. These notes form part of the surveys after construction as specified in Chapter 5 of this PART

2. General requirements

2.1 Where repairs to hull, machinery or equipment, which affect or may affect classification, are to be carried out by a riding crew during a voyage, such repairs are to be planned in advance. A complete repair procedure including the extent of proposed repair and the need for Surveyor's attendance during the voyage is to be submitted to and agreed by CCS reasonably in advance.

2.2 Failure to notify CCS, in advance of the repairs, may result in suspension of the ship's class until such time as the repair is redone or evidence submitted to satisfy the Surveyor that the repair was properly carried out.

2.3 Where in any emergency circumstance, emergency repairs are to be effected immediately, the repairs should be documented in the ship's log and submitted thereafter to CCS for use in determining further survey requirements.

2.4 The above is not intended to include maintenance and overhaul to hull, machinery and equipment in accordance with manufacturer's recommended procedures and established marine practice and which does not require CCS approval. However, any repair as a result of such maintenance and overhauls which affects or may affect classification is to be noted in the ship's log and submitted to the attending Surveyor for use in determining further survey requirements.

3. Requirements for commencement of repairs

3.1 A meeting is to be held with the owner prior to commencement of hull repairs during a ship's voyage to discuss and confirm the following:

(1) extent of intended repairs. All repairs to be based on CCS recommendations and/or concurrence;

(2) availability of pertinent drawings;

(3) verification of new materials regarding certification, grade and scantlings. Verified mill sheets to remain on board and to be provided to the attending Surveyor examining completed repairs;

(4) verification of welding consumables regarding certification and suitability for materials involved. Check on availability of drying ovens, holding containers, etc.;

(5) verification of the qualification of welders and supervisory personnel, qualification records to remain on board and to be provided to the attending Surveyor examining completed repairs;

(6) review of intended repair;

(7) review of the intended provisions to facilitate sound weldments, i.e. cleaning, preheating (if applicable) adherence to welding sequence principles;

(8) further, it might be necessary to restrict welding to certain positions and prohibit welding in more difficult positions when the ship's motions might influence the quality of the welding;

(9) review of the application of repair coating, as appropriate;

(10) review of intended working conditions, i.e. staging, lighting, ventilation, etc.;

(11) review of intended supervision and quality control;

(12) completed repairs are to be examined and tested as required to the satisfaction of the attending Surveyor.

3.2 All details and results of subject meeting to be covered by a memorandum. A copy of this memorandum is to be placed on board and to be provided to the attending Surveyor examining repairs. In addition, a copy is to be sent/faxed to the arrival port where completed repairs will be examined.

4. Repairs to hull structures and survey

4.1 Any contemplated repairs to primary hull structures, i.e. main longitudinal and transverse members and their attachments, are to be submitted to CCS for review prior to commencing voyage repairs.

4.2 Riding repairs to primary hull structures are not to be permitted except in extreme circumstances.

4.3 Any repairs to primary hull structures are to require attendance by a Surveyor riding-ship survey or at regular intervals to confirm fit-up, alignment, general workmanship and compliance with

recommendations.

4.4 NDT of completed repairs to primary structures is to be carried out to the attending Surveyor's satisfaction.

4.5 Repairs to other hull structural parts may be accepted based on examination upon completion of repairs.

4.6 No hull repairs carried out by a riding crew are to be accepted unless:

(1) the initial meeting had been carried out and conditions found satisfactory;

(2) a final satisfactory examination upon completion was carried out.

Appendix 8 PROCEDURAL REQUIREMENTS FOR SERVICE SUPPLIERS

1. General requirements

1.1 To approve firms providing services, such as measurements, tests or maintenance of safety systems and equipment, CCS is to apply procedures in this unified requirement and relevant Annex 1.

2. Objective

2.1 The objective of this procedure is to set minimum requirements for approval and certification of service suppliers and is applicable to both initial and renewal audits.

3. Definitions

3.1 Manufacturer: A company that manufactures equipment required to be periodically serviced and/or maintained.

3.2 Service supplier (A service supplier or category of service supplier may be referred to here after simply as 'supplier'): A person or company, not employed by an IACS Member, who at the request of an equipment manufacturer, shipyard, vessel's owner or other client acts in connection with inspection work and provides services for a ship or a mobile offshore unit such as measurements, tests or maintenance of safety systems and equipment, the results of which are used by surveyors in making decisions affecting classification or statutory certification and services.

3.3 Agent: A person or company authorized to act for or to represent a manufacturer or approved / recognized service supplier.

3.4 Subsidiary: A company partly or wholly owned by a manufacturer or approved / recognized service supplier.

3.5 Subcontractor: A person or company providing services to a manufacturer or approved / recognized service supplier, with a formal contract defining the assumption of the obligations of the service supplier.

4. Application

4.1 This procedure applies to the approval of the following categories of service suppliers:

4.1.1 Statutory services

(1) Firms engaged in servicing inflatable liferafts, inflatable lifejackets, hydrostatic release units and marine evacuation systems

(2) Firms engaged in inspections and testing of radio communication equipment

(3) Firms engaged in inspections and maintenance of self-contained breathing apparatus

(4) Firms engaged in annual performance testing of voyage data recorders (VDRs) and simplified voyage data recorders (S-VDRs)

(5) Firms engaged in sound pressure level measurements of public address and general alarm systems on board ships

(6) Firms engaged in inspections of low location lighting systems using photo luminescent materials and evacuation guidance systems used as an alternative to low-location lighting systems

(7) Firms engaged in maintenance, thorough examination, operational testing, overhaul and repair of lifeboats and rescue boats, launching appliances and release gear.

(8) Firms engaged in inspection, performance testing and maintenance of Automatic Identification Systems (AIS)

(9) Firms engaged in Commissioning Testing of Ballast Water Management System (BWMS).

4.1.2 Classification and/or statutory services

(1) Firms engaged in thickness measurements on ships or mobile offshore units except:

① non-ESP ships less than 500 gross tonnage, and

② all fishing vessels.

(2) Firms carrying out in-water survey on ships and mobile offshore units by diver or Remotely Operated Vehicle (ROV)

(3) Firms engaged in inspections and maintenance of fire extinguishing equipment and systems

(4) Firms engaged in tightness testing of closing appliances such as hatches, doors etc., with ultrasonic equipment

(5) Firms engaged in measurements of noise level on board ships

(6) Firms engaged in examination of ro-ro ship's bow, stern, side and inner doors

(7) Firms engaged in testing of coating systems in accordance with IMO resolution MSC.215(82), as

amended, and IACS UI SC223 and/or resolution MSC.288(87), as amended
(8) Firms engaged in tightness testing of primary and secondary barriers of gas carriers with membrane cargo containment systems for vessels in service
(9) Firms engaged in survey using Remote Inspection Techniques (RIT) as an alternative means for Close-up Survey of the structure of ships and mobile offshore units
(10) Firms engaged in Cable Transit Seal Systems inspection on ships and Mobile Offshore Units.
4.1.3 Where CCS accepts work of a third party (e.g. service supplier) approved by itself, CCS is to verify the performance of such services. For statutory service, the flag State may increase the scope of verification to be applied to these services. The process is to be defined within CCS quality management system. For the purpose of accountability to the flag State, the work performed by the third party (e.g. service supplier) constitutes the work of CCS and is to be subject to the requirements incumbent upon CCS under the RO Code, IMO resolutions MSC.349(92) and MEPC.237(65).
4.2 Where the results of the following service providers are used by a Surveyor of CCS in making decisions affecting classification services then that service provider must be approved (including single approval) and verified by CCS.
— Firms engaged in thickness measurements on ships or mobile offshore units except:
(1) non-ESP ships less than 500 gross tonnage, and
(2) all fishing vessels.
— Firms carrying out in-water survey on ships and mobile offshore units by diver or Remotely Operated Vehicle (ROV).
— Firms engaged in tightness testing of closing appliances such as hatches, doors etc., with ultrasonic equipment.
— Firms engaged in survey using Remote Inspection Techniques (RIT) as an alternative means for Close-up Survey of the structure of ships and mobile offshore units.
4.3 Where such services are used by Surveyors in making decisions affecting statutory certification service, the firms are subject to approval and verification by CCS where CCS is so authorized by the relevant flag State Administration (i.e. the flag of the ship on which the servicing is to be done or the service equipment is to be used). For such services CCS may accept approvals done by:
i. the flag State Administration itself,
ii. duly authorized organizations acting on behalf of the flag State Administration, or
iii. other organizations those are acceptable to the flag State Administration (e.g. other governments, etc.).
4.4 Use of the approved service suppliers is not mandatory for the following services, unless instructed otherwise by the flag State Administration with respect to statutory certification:
— Firms engaged in inspections of low location lighting systems using photo luminescent materials and evacuation guidance systems used as an alternative to low-location lighting systems.
— Firms engaged in sound pressure level measurements of public address and general alarm systems on board ships.
— Firms engaged in measurements of noise level onboard ships.
— Firms engaged in testing of coating systems in accordance with IMO resolution MSC.215(82), as amended and IACS UI SC223 and/or MSC.288(87), as amended.
— Firms engaged in examination of ro-ro ships' bow, stern, side and inner doors.
4.5 Detailed requirements specific to the various categories of suppliers are given in Annex 1. National and/or international requirements may give additional requirements. References to such national and/or international requirements are given in Annex 1.

5. Procedure for approval and certification

5.1 Submission of documents
5.1.1 The following documents are to be submitted to CCS for review. General requirements concerning suppliers are given in 5.2, and specific requirements as relevant, in Annex 1:
— Outline of company, e.g. organization and management structure, including subsidiaries to be included in the approval/certification;
— List of nominated agents, subsidiaries and subcontractors;
— Experience of the company in the specific service area;
— For categories of service suppliers that require certification from manufacturers, manufacturer's documentary evidence that the service supplier has been certified or licensed to service the particular makes and models of equipment for which approval is sought are to be provided;
— List of operators/technicians/inspectors documenting training and experience within the relevant service area, and qualifications according to recognized national, international or industry standards, as

relevant;
— Description of equipment used for the particular service for which approval is sought;
— A guide for operators of such equipment;
— Training programmes for operators/technicians/inspectors;
— Check lists and record formats for recording results of the services referred to in Annex 1;
— Quality Manual and/or documented procedures covering requirements in 5.5;
— Documented procedures for communication with the crew prior to commencing work, so that it is safe to decommission the equipment being maintained, and to provide a safe system of work in place;
— Evidence of approval/acceptance by other bodies, if any;
— Information on the other activities which may present a conflict of interest;
— Record of customer claims and of corrective actions requested by certification bodies;
— Operators/technicians/inspectors documentation they have acknowledged the code of conduct.

5.2 General requirements

5.2.1 Extent of approval – The supplier is to demonstrate, as required by 5.2.2 to 5.2.11, that it has the competence and control needed to perform the services for which approval is sought.

5.2.2 Training of personnel – The supplier is responsible for the qualification and training of its personnel to a recognized national, international or industry standard as applicable. Where such standards do not exist, the supplier is to define standards for the training and qualification of its personnel relevant to the functions each is authorized to perform. The personnel are also to have adequate experience and to be familiar with the operation of any necessary equipment. Operators/technicians/inspectors are to have had a minimum of one year tutored on-the-job training. Where it is not possible to perform internal training, a program of external training may be considered as acceptable.

5.2.3 Supervision – The supplier is to provide supervision for all services provided. The responsible supervisor is to have had a minimum of two years of experience as an operator/technician/inspector within the activity for which the supplier is approved. For a supplier consisting of one person, that person is to meet the requirements of a supervisor.

5.2.4 Personnel records – The supplier is to keep records of the approved operators / technicians / inspectors. The record is to contain information on age, formal education, training and experience for the services for which they are approved.

5.2.5 Equipment and facilities – The supplier is to have the necessary equipment and facilities for the service to be supplied. A record of the equipment used is to be kept and available. The record is to contain information on maintenance and results of calibration and verifications. CCS is to assess and record the validity of previous measuring results when the equipment is found not to conform to requirements. CCS is to take appropriate action on the equipment affected.

5.2.6 Control of data

When computers are used for the acquisition, processing, recording, reporting, storage, measurement assessment and monitoring of data, the ability of computer software to satisfy the intended application is to be documented and confirmed by the service supplier. This is to be undertaken prior to initial use and reconfirmed as necessary.

Note: Commercial off-the-shelf software (e.g. word processing, database and statistical programmes) in general use within their designed application range may be considered to be sufficiently validated and do not require any subsequent confirmation.

5.2.7 Where several servicing stations are owned by a given company, each station is to be assessed and approved except as specified in 5.5.3

5.2.8 Procedures – The supplier is to have documented work procedures covering all services supplied.

5.2.9 Subcontractors – The supplier is to give information of agreements and arrangements if any parts of the services provided are subcontracted. Particular emphasis is to be given to quality management by the supplier in following-up such subcontracts. Subcontractors providing the services of the approved service supplier are also to meet the requirements of sections 5.

5.2.10 Verification – The supplier is to verify that the services provided are carried out in accordance with approved procedures.

5.2.11 Reporting – The report is to be prepared in a form acceptable to CCS. The report should detail the results of inspections, measurements, tests, maintenance and/or repairs carried out. Special guidelines may be given in Annex 1. The report is to include a copy of the certificate of approval.

5.2.12 Documented procedures and instructions should be available for the recording of damages and defects found during inspections, servicing and repair work. This documentation is to be made available upon request.

5.3 Auditing of the Supplier – Upon reviewing the submitted documents with satisfactory result, the supplier is audited in order to ascertain that the supplier is duly organised and managed in accordance with

the submitted documents, and that it is considered capable of conducting the services for which approval/certification is sought.

5.4 Certification is conditional on a practical demonstration of the performance of the specific service as well as satisfactory reporting being carried out. At initial audits, when the service supplier is already certified by other QSCS certified Society according to the provision of this Appendix, this may be verified through documentary review that a practical demonstration has already been carried out. At renewal audits, verification by documentary review of jobs undertaken since the previous audit and that have been accepted by a QSCS certified Society is acceptable and is sufficient to satisfy this requirement.

5.5 Quality system

5.5.1 The supplier is to have a documented system covering at least the following:

— code of conduct for the relevant activity;
— maintenance and calibration of equipment;
— training programmes for operators/technicians/inspectors;
— supervision and verification to ensure compliance with operational procedures;
— recording and reporting of information;
— quality management of subsidiaries, agents and subcontractors;
— job preparation;
— periodic review of work process procedures, complaints, corrective actions, and issuance, maintenance and control of documents.

5.5.2 A documented quality system complying with the most current version of ISO 9000 series and including the above items, would be considered acceptable.

5.5.3 If a manufacturer of equipment (and/or its service supplier) applies to CCS for inclusion of its nominated agents and/or subsidiaries (excluding any subcontractor), in the approval, then it must have implemented a quality system certified in accordance with the most current version of ISO 9000 series. The quality system must contain effective controls of the manufacturer's (and/or service supplier's) agents and/or subsidiaries. The nominated agents/subsidiaries must also have in place an equally effective quality system complying with the most current version of ISO 9000 series. Such approvals are to be based upon an evaluation of the quality system implemented by the parent company against the most current version of ISO 9000 series. CCS may require follow-up audits on such agents or subsidiaries against the most current version of ISO 9000 series to confirm adherence to this quality system.

5.6 Service supplier's relations with the equipment manufacturer

5.6.1 A company which works as a service station for manufacturer(s) of equipment (and as a service supplier in this field), is to be assessed by the manufacturer(s) and nominated as their agent. The manufacturer is to ensure that appropriate instruction manuals, material etc. are available for the agent as well as proper training of the agent's technicians. Such suppliers are to be approved either on a case by case basis, or in accordance with 5.5.3.

6. Certification

6.1 Upon satisfactory completion of both the audit of the supplier and the demonstration test, as applicable, CCS may issue a certificate of approval stating that the supplier's service operation system has been found to be satisfactory and that the results of services performed in accordance with that system may be accepted and utilised by CCS Surveyors in making decisions affecting classification or statutory certification, as relevant. The certificate is to clearly state the type and scope of services and any limitations or restrictions imposed including type of equipment and/or names of manufacturers of equipment where this is a limiting restraint. The supplier may also be included in CCS record of approved service suppliers.

6.2 Renewal or endorsement of the certificate is to be made at intervals not exceeding five (5) years by verification through audits that approved conditions are maintained or, where applicable, on expiry of the supplier's approval received from an equipment manufacturer, whichever comes first. In the latter case, CCS is to be informed in due course by the service supplier. CCS may require renewal or endorsement of the certificate at intervals shorter than five (5) years and may require intermediate audits. For firms engaged in thickness measurements, renewal/endorsement of the certificate is to be made at intervals not exceeding 3 years by verification that original conditions are maintained.

7. Information regarding alterations to the certified service operating system

7.1 When any alteration to the certified service operating system of the supplier is made, such alteration is to be immediately informed to CCS. Re-audit may be required when deemed necessary by CCS.

8. Cancellation of approval

8.1 CCS reserves the right to cancel the approval and to inform the IACS Members accordingly (For

Firms engaged in thickness measurements refer to PR 23).
8.2 Approval may be cancelled in the following cases:
8.2.1 Where the service was improperly carried out or the results were improperly reported.
8.2.2 Where a Surveyor finds deficiencies in the approval service operating system of the supplier and appropriate corrective action is not taken.
8.2.3 Where alterations have been made to the company's quality system relevant to the service supplier certificates, without written notification to CCS.
8.2.4 Where the intermediate audit, if requested as per 6.2, has not been carried out.
8.2.5 Where wilful acts or omissions are ascertained.
8.2.6 Where any deliberate misrepresentation has been made by the service supplier.
8.3 A supplier whose approval was cancelled, may apply for re-approval provided it has corrected the non-conformities which resulted in cancellation, and CCS is able to confirm it has effectively implemented the corrective action.
8.4 Expiration or cancellation of the Supplier's parent company approval automatically invalidates approval of all agents and subsidiaries if these are certified according to 5.5.3

9. Existing Approvals
Approvals for the categories of service suppliers granted before the date of implementation of this Appendix by CCS may remain valid as stated in the respective certificates for a period up to but not exceeding 3 years. Renewals of such certificates must be carried out in accordance with this Appendix.

Annex 1
Special Requirements for Various Categories of Service Suppliers

1. Firms engaged in thickness measurements on ships or mobile offshore units
1.1 Extent of engagement – Thickness measurement of structural material of ships or mobile offshore units except:
(1) non-ESP ships less than 500 gross tonnage, and
(2) all fishing vessels.
1.2 Supervisor – The responsible supervisor is to be qualified according to a recognized national or international industrial NDT standard (e.g. EN 473 level II as amended or ISO 9712 level II as amended).
1.3 Operators – The operators carrying out the measurements are to be certified to a recognized national or international industrial standard (e.g. EN 473 level I as amended or ISO 9712 level I as amended) and to have adequate knowledge of ship structures sufficient to elect a representative position for each measurement.
1.4 Equipment – On coated surfaces, instruments using pulsed echo technique (either with oscilloscope or digital instruments using multiple echoes, single crystal technique) are required. Single echo instruments may be used on uncoated surfaces, which have been cleaned and ground.
1.5 Procedures – Documented work procedures are at least to contain information on inspection preparation, selection and identification of test locations, surface preparation, protective coating preservation, calibration checks, and report preparation and content.
1.6 Reporting – The report is to be based on the guidelines given in UR Z7, UR Z7.1, UR Z7.2, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5, as relevant.
1.7 Verification – The supplier must have the Surveyor's verification of each separate job, documented in the report by the attending Surveyor(s) signature.

2. Firms engaged in tightness testing of closing appliances such as hatches, doors, etc., with ultrasonic equipment
2.1 Extent of engagement – Ultrasonic tightness testing of closing appliances such as hatches, doors, etc.
2.2 Operators – The operator is to have the following qualifications:
— have knowledge of different closing appliances such as hatches, doors etc. including their design, functioning and sealing features;
— have experience with the operation and maintenance of different closing appliances such as hatches, doors etc.;
— be able to document theoretical and practical training onboard in using the ultrasonic equipment specified.
2.3 It is to be demonstrated to the Surveyor that the ultrasonic equipment is fit for the purpose of detecting leakages in closing appliances.

2.4 Procedures – The supplier is to have documented work procedures which are to include the manual for the ultrasonic equipment specified, its adjustment, its maintenance, its operation and approval criteria.

3. Firms carrying out an in-water survey on ships and mobile offshore units by diver or Remotely Operated Vehicle (ROV)

3.1 Extent of engagement – In-water survey in lieu of a docking survey and/or the internal hull survey of compartments filled with water on ships and mobile offshore units by diver or Remotely Operated Vehicle (ROV).

3.2 Training of personnel – The supplier is responsible for the qualification of its divers, Remotely Operated Vehicle (ROV) operators and supervisors and for their training in the use of the equipment utilised when carrying out inspection. Knowledge of the following is to be documented:

— ship's underwater structure and appendages, propeller shaft, propeller, rudder and its bearings, etc.;
— non-destructive testing in accordance with a recognized national or international industrial NDT standard. This requirement only applies if an in-water survey company performs non-destructive testing;
— certification as a thickness measurement firm when conducting thickness measurements under water;
— bearing clearance measurements on rudders and propeller shaft;
— under-water video monitoring with TV-monitors on deck, as well as still picture work;
— operation of under-water communication system;
— any special equipment necessary for the work carried out.

3.3 A plan for training of personnel in the reporting system, minimum rules requirements for relevant ship or unit types, ship's or unit's underwater structure, measuring of bearing clearances, the recognition of corrosion damage, buckling and deteriorated coatings, etc. is to be included.

3.4 Supervisor

3.4.1 Diving Supervisor – Diving supervisor is to be qualified according to the supplier's general requirements and is to have a minimum of two years' experience as a diver carrying out inspection.

3.4.2 ROV Supervisor – ROV supervisor is to have a minimum of two (2) years of experience conducting inspections with ROVs.

3.5 Diver and Operators

3.5.1 Divers carrying out inspection – The diver carrying out the inspection is to have had at least one year experience as an assistant diver carrying out inspection (including participation in a minimum of 10 different assignments).

3.5.2 ROV operators- ROV operators are to have at least one year of experience working with ROVs conducting inspections on vessels.

3.6 Equipment

3.6.1 The following is to be available:

— closed circuit colour television with sufficient illumination equipment;
— two-way communication between diver and surface staff;
— video recording device connected to the closed circuit television;
— still photography camera;
— equipment for carrying out thickness gauging, non-destructive testing and measurements, e.g. clearances, indents, etc., as relevant to the work to be performed;
— equipment for cleaning of the hull.

3.6.2 In addition to above 3.6.1, the following is to be available for firms carrying out survey by ROV:

— Remote Operated Vehicle;
– Adequate controls or programming for the ROV functions required.

3.7 Procedures and guidelines

3.7.1 The supplier is to have documented operational procedures and guidelines for how to carry out the inspection and how to handle the equipment. These are to include:

— two-way communication between diver and surface;
— video recording and closed circuit television operation;
— guidance of the diver along the hull to provide complete coverage of the parts to be inspected.

3.7.2 In addition to above 3.7.1, documented operational procedures and guidelines for firms carrying out in-water survey by ROV are also to include:

— guidance for the operation and maintenance of the Remotely Operated Vehicle, if applicable;
— methods and equipment to ensure the ROV operator can determine the ROV's location and orientation in relation to the vessel.

3.8 Verification – The supplier must have the Surveyor's verification of each separate job, documented in the report by the attending Surveyor(s) signature.

4. Firms engaged in inspection and maintenance of fire extinguishing equipment and systems

4.1 Extent of engagement – Inspections and maintenance of fire-extinguishing equipment and systems such as fixed fire extinguishing systems, portable fire extinguishers and fire detection and alarm systems.

4.2 Extent of approval

— Service suppliers are to have professional knowledge of fire theory, fire-fighting and fire-extinguishing appliances sufficient to carry out the maintenance and/or inspections, and to make the necessary evaluations of the condition of the equipment.
— In demonstrating professional knowledge, service suppliers are to have an understanding of the various types of fires and the extinguishing media to be used on them.
— For fixed fire-extinguishing systems, service suppliers are to demonstrate an understanding of the principles involved with gas, foam, deluge, sprinkler and water-mist systems, as relevant for the approval being sought.

4.3 Procedures

— Service suppliers are to have documented procedures and instructions on how to carry out the servicing of the equipment and/or system. These are to either contain or make reference to the manufacturer's servicing manuals, servicing bulletins, instructions and training manuals, as appropriate, and to international requirements.
— Additionally. they are to make reference to any requirements (e.g. what markings should be appended to the equipment/system).

4.4 Reference documents − The service supplier is to have access to the following documents:

— manufacturer's servicing manuals, servicing bulletins, instructions and training manuals, as appropriate;
— type approval certificates showing any conditions that may be appropriate during the servicing and/or maintenance of fire-extinguishing equipment and systems;
— SOLAS, MSC.1/Circular.1318/Rev.1 (Revised Guidelines for the Maintenance and Inspections of Fixed Carbon Dioxide Fire-Extinguishing Systems), International Code for Fire Safety Systems (FSS Code), ISO 6406 (Periodic inspection and testing of seamless steel gas cylinders), and any documentation specified in the authorization or license from the equipment manufacturer;
— MSC/Circ.670 (Guidelines for the Performance and Testing Criteria and Surveys of High Expansion Foam Concentrates for Fixed Fire-Extinguishing Systems);
— MSC/Circ.798 (Guidelines for the Performance and Testing Criteria and Surveys of Medium Expansion Foam Concentrates for Fixed Fire-Extinguishing Systems);
— MSC.1/Circ.1312 (Revised Guidelines for the Performance and Testing Criteria and Surveys of Foam Concentrates for Fixed Fire-Extinguishing Systems as corrected by MSC/Circ.1312/Corr.1);
— MSC.1/Circ.1432 (Revised Guidelines for the Maintenance and Inspection of Fire Protection Systems and Appliances, as amended by MSC.1/Circ.1516);
— IMO resolution A. 951(23) – Improved Guidelines for Marine Portable Fire Extinguishers;
— MSC.1/Circ.1370 – Guidelines for the Design, Construction and Testing of Fixed Hydrocarbon Gas Detection Systems;
— Guidelines adopted by IMO for fire extinguishing equipment and systems specifically intended for service by service suppliers.

4.5 Equipment and facilities

4.5.1 General requirements

— If service suppliers undertake shore-based inspecting and maintenance, they should maintain and implement procedures for workshop cleanliness, ventilation and arrangement, with due cognisance of the spares and extinguishing media being stored, to ensure safe and effective working procedures.
— Service suppliers undertaking inspecting and maintenance of equipment and systems onboard are to provide the appropriate facilities to either complete the work onboard or remove the necessary items to their workshops.

4.5.2 Equipment

Sufficient and appropriate spares and tools are to be available as applicable, which should include:

— various scales to weigh items;
— means to hydrostatically pressure test components/systems/storage bottles;
— liquid/gas, flow meters, as appropriate;
— pressure gauges or manometers;
— in the cases of foam concentrates and portable fire-extinguishers, chemical analysis equipment and a testing bay, respectively;
— specific equipment/spares as may be specified by manufacturers;
— level measuring equipment for bottles; and
— recharging facilities for pressurized bottles, extinguishers and cartridges.

5. Firms engaged in servicing inflatable liferafts, inflatable lifejackets, hydrostatic release units and marine evacuation systems

5.1 Extent of engagement:

— servicing of inflatable liferafts, inflatable lifejackets, hydrostatic release units;

— servicing of marine evacuation systems.

5.2 Equipment and facilities – IMO resolution A.761(18), as amended by resolution MSC.55(66) and by MSC.388(94) gives recommendations on conditions for the approval of servicing stations for inflatable liferafts which are to be observed as relevant. Where inflatable liferafts are subject to extended service intervals, MSC.1/Circ.1328 should also be followed.

5.3 Procedures and instructions – The supplier is to have documented procedures and instructions for how to carry out service of equipment. Where inflatable liferafts are subject to extended service intervals in accordance with the requirements of SOLAS regulation III/20.8.3, MSC.1/Circ.1328 should be followed in addition to resolution A.761(18), as amended by resolution MSC.55(66) and by MSC.388(94).

5.4 The supplier is to provide evidence that it has been authorized or licensed to service the particular makes and models of equipment for which approval is sought by the equipment's manufacturer.

5.5 Reference documents − The service supplier is to have access to the following documents:

— IMO resolution A.761(18) − Recommendation on Conditions for the Approval of Servicing Stations for Inflatable Liferafts (adopted on 4 November 1993), as amended by resolution MSC.55(66) and by MSC.388(94);

— IMO resolution MSC.55(66);

— IMO resolution MSC.388(94);

— IMO MSC.1/Circ.1328 – Guidelines for the Approval of Inflatable Liferafts Subject to Extended Service Intervals Not Exceeding 30 Months;

— Manufacturer's servicing manuals, servicing bulletins, instructions and training manuals, as appropriate;

— Type approval certificates, showing any conditions that may be appropriate during the servicing and/or maintenance of inflatable liferafts, inflatable lifejackets, and hydrostatic release units;

— LSA Code/Chapter IV, 1995 SOLAS Conference Resolution 4 regarding marine evacuation systems.

6. Firms engaged in inspections and testing of radio communication equipment

6.1 Extent of engagement:

— surveys, inspection, testing, and/or measurement of radio equipment aboard ships or mobile offshore units for compliance with SOLAS regulations;

— annual testing of 406 MHz satellite EPIRBs for compliance with SOLAS regulation IV/15.9;

— the principles of this section also apply to service suppliers involved in inspection, performance testing and maintenance of Automatic Identification Systems (AIS). The service supplier is to be familiar with the equipment with which it will be involved, such as being a service agent for the equipment manufacturer.

6.2 Reference documents – The supplier is to have access to the following documents:

— SOLAS, 1974, as amended;

— IMO resolution A.789(19) − Specification on the survey and certification functions of recognized organizations acting on behalf of the Administration;

— MSC/Circ.1040/Rev.1 – Guidelines on Annual Testing of 406 MHz Satellite EPIRBs;

— MSC.1/Circ.1252 – Guidelines on Annual Testing of the Automatic Identification System (AIS);

— SN/Circ.227, SN/Circ.227/Corr.1 and 245 – Guidelines for the Installation of a Shipborne Automatic Identification System (AIS) and amendments thereto;

— ITU Radio Regulations;

— IMO Performance Standards for the equipment for which the service supplier is approved;

— Flag State Administration requirements;

— Relevant parts, if any, of CCS Rules and Guidelines.

6.3 Supervisor – The supervisor is to have a minimum two years education from a technical school, experience as inspector, and should preferably hold a general operator's certificate (GOC) or a GMDSS radioelectronic certificate (REC), recognized by the ITU, to operate or test radio transmitters. He should be aware of any local conditions for radio signal propagation, of regional radio stations and their facilities, and of the GMDSS infrastructure.

6.4 Radio inspector – The inspector carrying out the inspection is to have passed the internal training of the supplier in radiotelephony, GMDSS, and initial and renewal surveys, as applicable. The inspector is also to have at least one year technical school training or as alternative hold evidence that he followed a technical course approved by the relevant Administration, at least one year experience as an assistant radio

inspector and should preferably hold an appropriate national radio operators certificate, recognized by the ITU, such as a GMDSS general operator's certificate (GOC) or a GMDSS radioelectronic certificate (REC). He should be aware of any local conditions for radio signal propagation, of regional radio stations and their facilities, and of the GMDSS infrastructure.

6.5 Equipment and facilities

6.5.1 The supplier is to have the major and auxiliary equipment required for correctly performing the inspection. A record of the equipment used is to be kept. The record is to contain information on manufacturer and type of equipment, and a log of maintenance and calibrations.

6.5.2 A standard which is relevant to the radio equipment to be tested is to be available for the equipment and to be cited in the inspection report.

6.5.3 For equipment employing software in conjunction with the testing/examination, this software is to be fully described and verified.

6.6 Minimum required instruments:

— equipment for measuring frequency, voltage, current and resistance;
— equipment for measuring output and reflect effect on VHF and MF/HF;
— equipment for measuring modulation on MF/HF and VHF (AM, FM, PM);
— acid tester for checking specific gravity of lead batteries;
— tester for checking of correct output from Free-Float Satellite EPIRB;
— equipment for testing the performance of Automatic Identification Systems (AIS).

6.7 Procedures and instructions – The supplier is to have documented procedures and instructions for how to carry out testing and examination of radio equipment. Procedures and instructions for operating each item of the testing/inspection equipment are also to be kept and to be available at all times.

7. Firms engaged in inspections and maintenance of self-contained breathing apparatus

7.1 Extent of engagement − inspections and maintenance of self-contained breathing apparatus, emergency escape breathing devices (EEBD)

7.2 Extent of approval

— The supplier is to document and demonstrate that it has knowledge of the equipment and systems sufficient to carry out the inspections and testing of self-contained breathing apparatus to identify standards and to make the necessary evaluation of the condition of the equipment.
— In demonstrating professional knowledge, service suppliers are to have an understanding of the operational requirements involved with self-contained breathing apparatus and how these are to be maintained.
— Additionally, service suppliers are to demonstrate the necessary safety requirements applicable to such equipment.

7.3 Procedures

— Service suppliers are to have documented procedures and instructions on how to carry out the servicing of the equipment and/or system. These are to either contain or make reference to the manufacturer's servicing manuals, servicing bulletins, instructions and training manuals, as appropriate.
— Additionally, they are to make reference to any requirements (e.g. what markings should be appended to the equipment/system) and how they should be applied.

7.4 Reference documents − The service supplier is to have access to the following documents:

— manufacturers' servicing manuals, servicing bulletins, instructions and training manuals, as appropriate;
— type approval certificates showing any conditions which may be appropriate during the servicing and/or maintenance of self-contained breathing apparatus.

7.5 Equipment and facilities

7.5.1 General requirements

— If service suppliers undertake shore-based inspecting and maintenance, they are to maintain and implement procedures for workshop cleanliness, ventilation and arrangement, with due cognisance of the spares and pressurised bottles being stored, to ensure safe and effective working procedures.
— Service suppliers undertaking inspecting and maintenance of equipment and systems onboard are to provide the appropriate facilities to either complete the work onboard or remove the necessary items to their workshops.

7.5.2 Equipment

— Sufficient and appropriate spares and tools are to be available for repair, maintenance and servicing of self-contained breathing apparatus in accordance with the requirements of the manufacturers.
— These are to include, as required by the self-contained breathing apparatus equipment and/or systems as follows:
  — various scales to weigh items;

— means to hydrostatically pressure test components/systems/storage bottles;
— flow meters;
— pressure gauges or manometers;
— equipment for checking air quality;
— recharging facilities for breathing apparatus.

8. Firms engaged in examination of ro-ro ships bow, stern, side and inner doors

8.1 Extent of engagement − inspection of securing and locking devices, hydraulic operating system, electric control system for the hydraulics, electric indicator systems, and supporting, securing and locking devices and tightness testing.

8.2 The supplier is to be certified to the most current version of ISO 9000 series.

8.3 Supervision − In addition to 5.2.3, the requirement to have had a minimum of two years' experience as operator/technician/inspector within the activity, a supervisor is to have a minimum two years related education from a technical school.

8.4 Training of personnel - Operators carrying out non-destructive test (NDT) are to be qualified to a recognized national or international standard for the methods used.

8.5 Reference documents − The supplier is to have access to the following reference documents:

— IMO International Convention on the Safety of Life at Sea (SOLAS, 1974), as amended;
— ISO 9002:1994 − Quality systems − Model for quality assurance in production, installation and servicing;
— UR Z24 − Survey Requirements for Shell and Inner Doors of Ro-Ro ships, or its equivalent, by CCS.

8.6 Required equipment

8.6.1 For inspection of supporting securing and locking devices, hinges and bearings:

— equipment for measuring clearances (i.e. feeler gauges, vernier calipers, micrometers);
— non-destructive test (i.e. dye penetrant, magnetic particle inspection).

8.6.2 For tightness testing:

— ultrasonic leak detector or equivalent.

8.6.3 For inspection of hydraulic operating system:

— pressure gauges;
— particle counter for analysing the quality of hydraulic fluid.

8.6.4 For inspection of electric control system and indication system:

— digital multi-meter;
— earth fault detector.

8.7 Procedures and instructions

8.7.1 The supplier is to have access to drawings and documents, including the operating and inspection manual.

8.7.2 The supplier is to have access to the service history of the doors.

8.7.3 The supplier should use, complete and sign a checklist which has been found acceptable by CCS.

9. Firms engaged in annual performance testing of voyage data recorders (VDRs) and simplified voyage data recorders (S-VDRs)

9.1 Extent of engagement – Testing and servicing of voyage data recorders (VDRs) and simplified voyage data recorders (S-VDRs) in accordance with SOLAS regulation V/18.8 and IMO MSC.1/Circular 1222/Rev.1 − Guidelines on Annual Testing of Voyage Data Recorders (VDRs) and Simplified Voyage Data Recorders (S-VDRs), as applicable.

9.2 Extent of approval

9.2.1 The supplier is to provide evidence that he has been authorized or licensed by the equipment's manufacturer to service the particular makes and models of equipment for which approval is sought.

9.2.2 Where the service supplier is also the manufacturer of the voyage data recorder (VDR) or simplified voyage data recorder (S-VDR) and has elected to apply IMO MSC.1/Circular 1222/Rev.1 − Guidelines on Annual Testing of Voyage Data Recorders (VDRs) and Simplified Voyage Data Recorders (S-VDRs) in its entirety for the purpose of acting as a service supplier engaged in annual performance testing, the following are to apply:

— The manufacturer is responsible for appointing manufacturer's authorized service stations to carry out annual performance testing.
— The manufacturer is required to be an approved service supplier and is to satisfy the requirements for service suppliers engaged in annual performance testing of voyage data recorders (VDRs) and simplified voyage data recorders (S-VDRs), as applicable.
— The manufacturer's authorized service station is not required to be an approved service supplier.

— The manufacturer is to demonstrate that IMO MSC.1/Circular 1222/Rev.1 − Guidelines on Annual Testing of Voyage Data Recorders (VDRs) and Simplified Voyage Data Recorders (S-VDRs) is applied in its entirety.

9.3 Procedures

9.3.1 The service supplier is to have documented procedures and instructions.

9.3.2 Where the service supplier is also the manufacturer of the voyage data recorder (VDR) or simplified voyage data recorder (S-VDR) and has selected to apply IMO MSC.1/Circular 1222/Rev.1 − Guidelines on Annual Testing of Voyage Data Recorders (VDRs) and Simplified Voyage Data Recorders (S-VDRs) in its entirety for the purpose of acting as a service supplier engaged in annual performance testing, the following are to apply:

— The manufacturer is to have documented procedures for the assessment and authorization of manufacturer's authorized service stations who carry out annual performance testing.

— The manufacturer is to have documented procedures for the review of manufacturer's authorized service stations annual performance test reports, analysis of the voyage data recorder (VDR) and simplified voyage data recorder (S-VDR) 12 hour log and the issue of annual performance test certificates to the owner/operator.

— The manufacturer is to maintain a list of manufacturer's authorized service stations that can be accessed (by any available means, e.g. via a nominated contact point or from the manufacturer's website) upon request.

9.4 Reference documents

9.4.1 The service supplier is to have access to the following documents:

— IMO International Convention on the Safety of Life at Sea (SOLAS 74/78), regulation V/18.8 – Approval, surveys and performance standards of navigational systems and equipment and voyage data recorder;

— IMO MSC.1/Circular 1222/Rev.1 − Guidelines on Annual Testing of Voyage Data Recorders (VDRs) and Simplified Voyage Data Recorders (S-VDRs) (11 December 2006);

— IMO resolution A.861(20) (adopted on 27 November 1997), as amended by IMO resolution MSC.214(81) and resolution MSC.333(90) − Performance Standards for Shipborne Voyage Data Recorders (VDRs);

— IMO resolution MSC.163(78) − Performance Standards for Shipborne Simplified Voyage Data Recorders (S-VDRs) (adopted on 17 May 2004), as amended by IMO resolution 214(81).

9.4.2 The service supplier is to have access to applicable industry performance standards, e.g.:

— IEC 61996 − Maritime navigation and radiocommunication equipment and systems − Shipborne voyage data recorder (VDR);

— IEC 61996-2 − Maritime navigation and radiocommunication equipment and systems –Shipborne voyage data recorder (VDR) – Part 2: Simplified voyage data recorder (S-VDR) – Performance requirements, method of testing and required test results.

9.4.3 The service supplier is also to have access to any documentation specified in the authorization or license from the equipment manufacturer.

9.5 Equipment and facilities − In addition, the service supplier is to have equipment as specified in the authorization or license from the equipment manufacturer.

9.6 Reporting − test report

9.6.1 The service supplier is to issue a certificate of compliance as specified in regulation V/18.8 of the International Convention on the Safety of Life at Sea (SOLAS, 1974), as amended.

9.6.2 Annual performance test of VDR and S-VDR should be recorded in the form of the model test report given in the Appendix to MSC.1/Circular 1222/Rev.1, signed and stamped by the service supplier and attached to the annual performance test certificate.

9.6.3 Where the service supplier is also the manufacturer of the voyage data recorder (VDR) or simplified voyage data recorder (S-VDR) and has selected to apply IMO MSC.1/Circular 1222/Rev.1 − Guidelines on Annual Testing of Voyage Data Recorders (VDRs) and Simplified Voyage Data Recorders (S-VDRs) in its entirety for the purpose of acting as a service supplier engaged in annual performance testing, the manufacturer is to make arrangements for the following:

— review of the manufacturer's authorized service station annual performance test report;

— analysis of the recorder's 12 hour log;

— checking of the master record/database for the recorder.

9.6.4 Issue of the annual performance test certificate to the owner/operator within 45 days of completion of the annual performance test.

10. Firms engaged in inspections of low location lighting systems using photo luminescent materials

and evacuation guidance systems used as an alternative to low-location lighting systems

10.1 Extent of engagement – Luminance measurements on board ships of low location lighting systems using photo luminescent materials.

10.2 Operators – The operator is to have the following qualifications:

— have adequate knowledge of the applicable international requirements (namely SOLAS regulation II-2/13.3.2.5, IMO resolution A.752(18) − Guidelines for the Evaluation, Testing and Application of Low-Location Lighting on Passenger Ships, ISO 15370-2010, FSS Code Chapter 11);

— be able to document theoretical and practical training onboard in using equipment specified.

10.3 Equipment – The measuring instrument is to incorporate a fast-response photometer head with CIE (International Commission on Illumination) photopic correction and have a measurement range of at least 10^{-4} cd/m^2 to 10 cd/m^2.

10.4 Procedures – Documented work procedures are at least to contain information on inspection preparation, selection and identification of test locations.

10.5 Reporting – The report is to conform to Annex C of ISO 15370-2010.

10.6 Verification – The supplier must have the Surveyor's verification of each separate job, documented in the report by the attending Surveyor's signature.

10.7 Reference documents

The service supplier is to have access to the following documents:

— IMO International Convention on the Safety of Life at Sea (SOLAS 74/78), regulation II-2/13.3.2.5 – Marking of escape routes;

— IMO Fire Safety Systems (FSS Code), Chapter 11 – Low-location lighting systems;

— IMO resolution A.752(18) − Guidelines for the Evaluation, Testing and Application of Low-Location Lighting on Passenger Ships (adopted on 4 November 1993);

— ISO 15370:2010 − Ships and marine technology − Low-location lighting on passenger ships – Arrangement;

— MSC/Circ.1168 – Interim guidelines for the testing, approval and maintenance of evacuation guidance systems used as an alternative to low-location lighting systems.

11. Firms engaged in sound pressure level measurements of public address and general alarm systems on board ships

11.1 Extent of engagement – Sound pressure level measurements of public address and general alarm systems on board ships.

11.2 Operators – The operator is to have the following qualifications:

— have adequate knowledge of the applicable international requirements (SOLAS regulations III/4 and 6, LSA Code/Chapter VII/7.2, IMO Code on Alarms and Indicators, 1995, as amended);

— be able to document theoretical and practical training onboard in using equipment specified.

11.3 Equipment – The measuring instrument is to be an integrating sound level meter with frequency analyser capabilities complying with IEC (International Electrotechnical Commission) 60651 and IEC 61672, type 1 precision class with, at least an A-weighting frequency response curve and 1/3 octave and 1 octave band filters, complying to IEC 61260, as appropriate for the measurements to be carried out. In addition microphones are to be of the random incidence type, complying with IEC 60651.

11.4 Procedures – Documented work procedures are at least to contain information on inspection preparation, calibration, selection and identification of test locations.

11.5 Reporting – The report is to describe, as a minimum, the environmental conditions of the tests and, for each test location, the ambient noise level or the speech interference level, as appropriate for the measurements to be carried out. The report is to conform to any other specific requirement of CCS.

11.6 Verification – The supplier must have the Surveyor's verification of each separate job, documented in the report by his signature.

11.7 Reference documents

The service supplier is to have access to the following documents:

— SOLAS 74/78, regulation III/4 – Evaluation, testing and approval of life-saving appliances and arrangements;

— SOLAS 74/78, regulation III/6 – Communications;

— International Life-Saving Appliance (LSA) Code, Chapter VII/7.2 – General alarm and public address system;

— IMO Code on Alarms and Indicators, 1995, as amended;

— IEC 60651 (2001-10) − Sound level meters;

— IEC 61672 − Electroacoustics − Sound level meters;

— IEC 61260 − Electroacoustics − Octave-band and fractional-octave-band filters.

12. Firms engaged in testing of coating systems in accordance with IMO resolution MSC.215(82), as amended and IACS UI SC223 and/or resolution MSC.288(87), as amended

12.1 Laboratories

12.1.1 Extent of engagement − Testing of coatings systems according to IMO resolution MSC.215(82), as corrected by IMO MSC.1/Circ.1381 and amended by IMO resolution 341(91) and IACS UI SC223 and/or MSC.288(87), as corrected by IMO MSC.1/Circ.1381 and amended by IMO resolution 341(91).

12.1.2 The laboratory is to provide to CCS the following information:

— A detailed list of the Laboratory test equipment for the coating approval according to the IMO resolution MSC.215(82), as amended and/or MSC.288(87), as amended.

— A detailed list of reference documents comprising a minimum those referred to in IMO resolution MSC.215(82), as amended and/or MSC.288(87), as amended for the coating approval.

— Details of test panel preparation, procedure of test panel identification, coating application, test procedures and a sample test report.

— Details of exposure method and site for weathering primed test panels.

— A sample daily or weekly log/form for recording test conditions and observations including unforeseen interruption of the exposure cycle with corrective actions.

— Details of any sub-contracting agreements (if applicable).

— Comparison test report with an approved coating system or laboratory if available.

12.1.3 Reporting – Reference is made to the following IACS Recommendations:

— Rec.101: IACS Model Report for IMO resolution MSC.215(82) Annex 1 “Test Procedures for Coating Qualification”;

— Rec.102: IACS Model Report for IMO resolution MSC.215(82) Annex 1 “Test Procedures for Coating Qualification”, Section 1.7 – Crossover Test.

12.1.4 Audit of the test laboratory is to be based on this procedure and the standards listed in the IMO resolution MSC.215(82), as amended and/or MSC.288(87), as amended for the coating approval.

13. Firms engaged in maintenance, thorough examination, operational testing, overhaul and repair of lifeboats and rescue boats, launching appliances and release gear

13.1 Extent of engagement – Maintenance, thorough examination, operational testing, overhaul and repair of:

.1 lifeboats (including free-fall lifeboats), all rescue boats (including inflated rescue boats and fast rescue boats); and

.2 launching appliances and on-load and off-load release gear for lifeboats (including primary and secondary means of launching appliances for free-fall lifeboats), rescue boats, fast rescue boats and davit-launched liferafts.

13.2 Extent of approval

13.2.1 The contents of this procedure apply equally to manufacturers or ship’s operator when they are acting as service suppliers.

13.2.2 Any service supplier engaged in maintenance, thorough examination, operational testing, overhaul and repair of lifeboats and rescue boats, launching appliances and release gear carried out in accordance with SOLAS regulation III/20 shall be approved for these operations for each make and type of equipment for which they provide the service in accordance with IMO Resolution MSC.402(96)/Corr.1 (annex, section 7).

Such approval shall include, as a minimum:

- employment and documentation of personnel certified in accordance with a recognized national, international or industry standard as applicable, or an equipment manufacturer’s established certification program. In either case, the certification program shall be based on the paragraph 13.3 for each make and type of equipment for which service is to be provided; and,
- compliance with provisions of paragraphs 13.4, 13.5 and 13.6.

13.2.3 In cases where an equipment manufacturer is no longer in business or no longer provides technical support, service suppliers may be approved for the equipment on the basis of prior approval for the equipment and/or long term experience and demonstrated expertise as an authorized service provider.

13.3 Certification of personnel

13.3.1 Personnel for the work specified in 13.1 shall be certified by the manufacturer or the Service Supplier for each make and type of the equipment to be worked on. Approved Service Supplier is allowed to certify its own personnel (i.e. employed by the same service supplier) only.

13.3.2 The education for initial certification of personnel should be documented and address, as a minimum:

— causes of lifeboat and rescue boat accidents;
— relevant rules and regulations, including International Conventions;
— design and construction of lifeboats (including free-fall lifeboats), rescue boats and fast rescue boats, including on load release gear and launching appliances;
— education and practical training in the procedures specified in section 6 of annex to IMO Resolution MSC.402(96)/Corr.1 for which certification is sought;
— detailed procedures for thorough examination, operational testing, repair and overhaul of lifeboats(including free-fall lifeboats), rescue boats and fast rescue boats, launching appliances and on load release gear, as applicable;
— procedures for issuing a report of service and statement of fitness for purpose based on IMO Resolution MSC.402(96)/Corr.1 (annex, paragraph 5.3); and
− Work, health and safety issues while conducting activities on board.

13.3.3 The education and training for the personnel shall include practical technical training on thorough examination, operational testing, maintenance, repair and overhaul techniques for which the personnel are to be certified. The technical training shall include disassembly, reassembly, correct operation and adjustment of the equipment. Classroom training shall be supplemented by field experience in the operations for which certification is sought, under the supervision of a certified person.

13.3.4 Prior to issuance of personnel certification, a competency assessment shall be satisfactorily completed, using the equipment for which the personnel are to be certified.

13.3.5 Upon completion of training and competency assessment, a certificate shall be issued defining the level of qualification and the scope of the certification (i.e. makes and types of equipment and specifically state which activities (annual thorough examination and operational tests; 5-year thorough examination, overhaul; overload operational tests; repairs) are covered by the certification). The expiry date shall clearly be written on the certificate and shall be three years from the date of issue. The validity of any certificate shall be suspended in the event of any shortfall in performance and only revalidated after a further competency assessment.

13.3.6 A competency assessment shall be conducted to renew the certification. In cases where refresher training is found necessary a further assessment shall be carried out after completion.

13.4 Reference Documents − The service supplier is to have access to the following documents:
— IMO resolution MSC.402(96)/Corr.1 Requirements for Maintenance, Thorough Examination, Operational Testing, Overhaul and Repair of Lifeboats and Rescue Boats, Launching Appliances and Release Gear;
— IMO resolution A.689(17), recommendation on testing of life-saving appliances and, for life-saving appliances installed on board on or after 1 July 1999;
— IMO resolution MSC.81(70), as amended, revised recommendation on testing of life-saving appliances;
— Manufacturer’s instructions (including updates, amendments and safety notices) for repair work involving disassembly or adjustment of on-load release mechanisms and davit winches;
— type approval certificate showing any conditions that may be appropriate during the servicing and/or maintenance of lifeboats, launching appliances and on-load release gear.

13.5 Equipment and facilities − The service supplier is to have access to the following:
— sufficient tools, and in particular any specialized tools specified in the equipment manufacturer’s instructions, including portable tools as needed for work to be carried out on board ship;
— access to appropriate parts and accessories as specified by the equipment manufacturer for maintenance and repair;
— for servicing and repair work involving disassembly or adjustment of on-load release mechanisms, availability of genuine replacement parts as specified or supplied by the equipment manufacturer.

13.6 Reporting − The report shall conform to the requirements of IMO Resolution MSC.402(96)/Corr.1 (annex, paragraph 5.3). When repairs, thorough examinations and annual servicing are completed, a statement confirming that the lifeboat arrangements remain fit for purpose should be promptly issued by the service supplier that conducted the work. A copy of valid documents of certification and authorization as appropriate shall be included with the statement.

14. Firms engaged in measurements of noise level onboard ships

14.1 Extent of engagement

Sound pressure level measurements onboard Ship.

14.2 Supervisor

The supervisor is to have a minimum of 2 years of experience as an operator in sound pressure level measurements.

14.3 Operators

The operator is to have the following qualifications:
— knowledge in the field of noise, sound measurements and handling of measurement equipment;
— adequate knowledge of the applicable international requirements (SOLAS regulation II-1/3-12, as amended, and IMO Code on Noise Levels on Board Ships, as amended);
— at least one year experience, including participation in a minimum of 5 measurement campaigns as an assistant operator;
— training concerning the procedures specified in IMO Code on Noise Levels on Board Ships;
— be able to document theoretical and practical training onboard in using a sound level meter.

14.4 Equipment

14.4.1 Sound level meters

Measurement of sound pressure levels is to be carried out using precision integrating sound level meters. Such meters are to be manufactured to IEC 61672-1(2002-05)1, as amended, type/class[1] standard as applicable, or to an equivalent standard acceptable to the Administration[2].

[1] Recommendation for sound level meters.

[2] Sound level meters class/type 1 manufactured according to IEC 651/IEC 804 may be used until 1 July 2016.

14.4.2 Octave filter set

When used alone, or in conjunction with a sound level meter, as appropriate, an octave filter set is to conform to IEC 61260 (1995)[3], as amended, or an equivalent standard acceptable to the Administration.

[3] Octave-band and fractional-octave-band filters.

14.4.3 Sound Calibrator

Sound calibrators are to comply with the standard IEC 60942(2003-01), as amended, and to be approved by the manufacturer of the sound level meter used.

14.4.4 Calibration

Sound Calibrator and sound level meter are to be verified at least every two years by a national Standard laboratory or a competent laboratory accredited according to ISO/IEC 17025:2017, as amended. A record with a complete description of the equipment used is to be kept, including a calibration log.

14.4.5 Microphone wind screen

A microphone wind screen is to be used when taking readings outside, e.g. on navigating bridge wings or on deck, and below deck where there is any substantial air movement. The wind screen should not affect the measurement level of similar sounds by more than 0.5 dB(A) in "no wind" conditions.

14.5 Procedures and instructions

14.5.1 The supplier is to have documented procedures and instructions to carry out service of the equipment.

Documented work procedures are at least to contain information on inspection preparation, selection and identification of sound level measurement locations, calibration checks and report preparation.

14.5.2 The supplier is to have access to the following documents:
— SOLAS, 1988, as amended (Reg.II-1/3-12);
— IMO resolution A.468(XII) and resolution MSC.337(91) Code on Noise Levels on Board Ships;
— IMO resolution A.343(IX) Recommendation on methods of measuring noise levels at listening posts;
— CCS Rules and Guidelines.

14.6 Reporting

A noise inspection report is to be made for each ship. The report is to comprise information on the noise levels in the various spaces on board. The report is to show the reading at each specified measuring point. The points are to be marked on a general arrangement plan, or on accommodation drawings attached to the report, or to otherwise be identified.

The format for noise inspection reports is set out in appendix 1 of IMO Code on Noise Levels on Board Ships and may conform to any other specific requirement of CCS (refer to IMO resolution MSC.337(91)).

14.7 Verification

The supplier must have the Surveyor’s verification of each separate job, documented in the report by his signature.

15. Firms engaged in tightness testing of primary and secondary barriers of gas carriers with membrane cargo containment systems for vessels in service

15.1 Extent of engagement

Firms carrying out the following:
— global vacuum testing of primary and secondary barriers;
— acoustic emission (AE) testing;
— thermographic testing.

15.2 Requirements for firms engaged in global testing of primary and secondary barriers

15.2.1 Testing Procedures – Testing is to be carried out in accordance with cargo containment system designer's procedures as approved by CCS.
15.2.2 Authorization − The supplier is to be authorized by the system designer to carry out the testing.
15.2.3 Equipment – Equipment is to be maintained and calibrated in accordance with recognized national or international industrial standards.
15.2.4 Reporting – The report is to contain the following:
— date of testing;
— identity of test personnel;
— vacuum decay data for each tank;
— summary of test results.
15.3 Requirements for firms engaged in acoustic emission (AE) testing
15.3.1 Testing procedures – The supplier is to have documented procedures based upon recognized national or international industrial standards to perform ultrasonic leak test using AE sensors for the secondary barrier of membrane cargo containment systems. The procedures are to include details of personnel responsibilities and qualification, instrumentation, test preparation, test method, signal processing, evaluation and reporting.
Note: The differential pressure during testing should not exceed the containment system designer's limitations.
15.3.2 Supervisor – The responsible supervisor is to be certified to a recognized national or international industrial standard (e.g. Level II, ISO-9712, as amended or SNT-TC-1A, as amended) and have one year experience at Level II.
15.3.3 Operators – The operators carrying out the acoustic emission (AE) testing are to be certified to a recognized national or international industrial standard (e.g. Level I, ISO-9712, as amended or SNT-TC-1A, as amended) and to have adequate knowledge of ship structures sufficient to determine sensor placement.
15.3.4 Equipment – Equipment is to be maintained and calibrated in accordance with recognized national or international industrial standards or equipment manufacturer's recommendations.
15.3.5 Evaluation of acoustic emission (AE) testing – Must be carried out by the supervisor or individuals certified to a recognized national or international industrial standard (e.g. Level II, ISO-9712, as amended or SNT-TC-1A, as amended) and have one year experience at Level II.
15.3.6 Reporting – The report is to contain the following:
— date of testing;
— supervisor and operator(s) certifications;
— description of time and pressure of each cycle of test;
— list and sketch detailing location of possible defects.
15.4 Requirements for firms engaged in thermographic testing
15.4.1 Testing Procedures – Testing is to be carried out in accordance with the cargo containment system designer's procedures as approved by CCS.
15.4.2 Authorization − The supplier is to be authorized by the system designer to carry out the testing.
15.4.3 Supervisor – The responsible supervisor is to be certified to a recognized national or international industrial standard (e.g. Level II, ISO-9712, as amended or SNT-TC-1A, as amended) with additional certification in infrared/thermal testing. SNT-TC-1A certified personnel must provide evidence that training on Level II or above has been administered by an independent training body centrally certified to ASNT or a comparable nationally recognized certification scheme.
15.4.4 Operators – The operators carrying out the imaging are to be certified to a recognized national or international industrial standard (e.g. Level I, ISO-9712, as amended or SNT-TC-1A, as amended) with additional certification in infrared/thermal testing and to have adequate knowledge of ship structures sufficient to determine position for each identified image, and of the containment system to understand the basis of the testing. SNT-TC-1A certified personnel must provide evidence that training on Level I or above has been administered by an independent training body centrally certified to ASNT or a comparable nationally recognized certification scheme.
15.4.5 Equipment – Thermal cameras and sensors are to be in accordance with the system designer's procedures with regards to sensitivity, accuracy and resolution.
Equipment are to be in accordance with recognized standard (IEC, etc.) with regards their safety characteristics for the use in hazardous areas (in gas explosive atmosphere), maintained and calibrated in accordance with the maker's recommendations.
15.4.6 Evaluation of thermographic images – Must be carried out by the supervisor or individuals certified to a recognized national or international industrial standard (e.g. Level II, ISO-9712, as amended or SNT-TC-1A, as amended) with additional certification in infrared/thermal testing. SNT-TC-1A certified personnel must provide evidence that training on Level II or above has been administered by an independent training body centrally certified to ASNT or a comparable nationally recognized certification

scheme.
15.4.7 Reporting – The report is to contain the following:
— date of testing;
— supervisor and operator(s) certifications;
— differential pressures of all phases;
— list and sketch detailing location of thermal indications;
— thermographic images of all phases of testing for thermal indications;
— evaluation of thermal images indicating possible leaks.

16. Firms engaged in survey using Remote Inspection Techniques (RIT) as an alternative means for Close-up Survey of the structure of ships and mobile offshore units

16.1 Definitions:
— Close-Up Survey: A Close-Up Survey is a survey where the details of structural components are within the close visual inspection range of the surveyor i.e. normally within reach of hand.
— Remote Inspection Techniques (RIT): RIT is a means of survey that enables examination of any part of the structure without the need for direct physical access of the surveyor (refer to IACS Rec.42). Remote inspection techniques may include the use of:
- Unmanned Aerial Vehicles (UAV)
- Drones
- Unmanned robot arm
- Remotely Operated Vehicles (ROV)
- Climbers
- Other means acceptable to CCS

16.2 Extent of engagement – Close-up Survey of ships' structure and mobile offshore units' structure by remote inspection techniques. For in-water close-up survey of the internal compartments by Remotely Operated Vehicle (ROV), suppliers are also to hold separate approval as a "Firm carrying out an in-water survey on ships and mobile offshore units by diver or Remotely Operated Vehicle (ROV)" (see Annex 1, Section 3).
16.3 Training and qualification of operators – The supplier is responsible for the training and qualification of its operators to undertake the remote inspections. UAV Pilots are to be qualified and licenced in accordance with applicable national requirements or an equivalent industrial standard acceptable to the society.
Knowledge of the following is to be documented:
- Marine and/or offshore nomenclatures.
- The structural configuration of relevant ships types and MOUs, including internal structure.
- The remote inspection equipment and its operation.
- Survey plans for examination of hull spaces of various configurations, including appropriate flight plans if using a UAV.
- Thickness measurement (TM) and non-destructive test (NDT) in accordance with a recognised National or International Industrial NDT Standard when these are part of the service. Suppliers undertaking TMs are to hold separate approval as a'Firm engaged in thickness measurements on ships' (see Annex 1, Section 1).

16.4 Training Plan – the supplier is to maintain a documented training plan for personnel. The plan is to include requirements for training in the minimum Rule requirements for the structure of relevant ships types and MOUs, the recognition of structural deterioration (including corrosion, buckling, cracking and deteriorated coatings) and use of the reporting system.
16.5 Supervisor – The supervisor is to be certified according to the recognized national requirements or an equivalent industrial standard (e.g. XXX Level) and is to have a minimum of two years' experience in the inspection of ship's and/or MOU's structure.
16.6 Operators – The operator carrying out the inspection is to be certified according to the recognized national requirements or an equivalent industrial standard (e.g. YYY Level) and have had at least one year's experience as an assistant carrying out inspections of ship's and/or MOU's structure (including participation in a minimum of five different assignments). The operators of those RIT which require, according to the international and national legislations, to be licensed for their use are to hold valid documentation issued by the appropriate Bodies (e.g. UAV Pilots are to be qualified and licenced in accordance with applicable national requirements).
16.7 Equipment – The following is to be available:

- Remotely operated platform with data capture devices capable of operation within an enclosed space.
- Means of powering the platforms with sufficient capacity to complete the required inspections, including spare batteries if applicable.
- Data collection devices which may include cameras capable of capturing in high definition both video images and still images.
- Illumination equipment.
- High definition display screen with live high definition feed from inspection cameras. (When this is part of the RIT).
- Means of communication.
- Data recording devices, as applicable.
- Equipment for carrying out thickness gauging and/or non-destructive testing, as relevant to the work to be performed (when this is part of the service).

16.8 Procedures and guidelines – The supplier is to have documented operational procedures and guidelines for how to plan, carry out and report inspections; how to handle/operate the equipment; collection and storage of data. These shall include:

- Requirements for preparation of inspection plans when UAV are part of the equipment flight plans shall be included.
- Operation of the remotely operated platforms.
- Operation of lighting.
- Calibration of the data collection equipment.
- Operation of the data collection equipment.
- Two-way communication between the operator, platform, Surveyor, other personnel such as support staff and ships officers and crew.
- Guidance of the operator to provide complete coverage of the structure to be inspected.
- Guidance for the maintenance of the remotely operated platforms, data capture and storage devices and display screens, as applicable.
- Requirements for the collection and validation of data.
- If data is to be stored, then requirements for location attribution (geo-tagging), validation and storage of data.
- Requirements for the reporting of inspections, including the recording of damages and defects found during inspection and repair work.

16.9 Documentation and records - The supplier is to maintain the following:

- Records of training.
- Operator statutory and regulatory certificates and licences.
- Equipment register for UAVs, Robots, data collection devices, data analysis devices and any associated equipment necessary to perform inspections.
- Equipment maintenance manuals and records / logbook.
- Records of calibration.
- UAV / Robot operation logbook.

16.10 Verification – The supplier must have the Surveyor’s verification of each separate job, documented in the report by the attending Surveyor(s) signature.

17. Firms engaged in Watertight Cable Transit Seal Systems Inspection on Ships and Mobile Offshore Units

17.1 Extent of engagement

17.1.1 Inspection of the Watertight Cable Transit Seal Systems for compliance with the relevant approval certificates and product installation manuals, (types of penetrating cables, dimensions, fill ratio and insulation details, as applicable).

17.2 Extent of Approval

17.2.1 The contents of this procedure apply equally to manufacturers or shipyards when they are acting as Service Suppliers.

17.2.2 Any Service Supplier engaged in the inspections of watertight cable transit seal systems shall be qualified in these inspections for each make and type of equipment for which they provide the inspection, and provide manufacturers documentary evidence that they have been so authorized or they are certified in accordance with an established system for training and authorization.

Such qualification shall include, as a minimum:

(1) Employment and documentation of personnel certified in accordance with a recognized national, international or industry standard as applicable, or an equipment manufacturer's established certification program. In either case, the certification program shall be based on the paragraph 17.3 for each make and type of equipment for which inspection is to be provided, and
(2) Compliance with provisions of paragraphs 17.4, 17.5 and 17.6.
17.2.3 In cases where an equipment manufacturer is no longer in business or no longer provides technical support, Service Suppliers may be authorised for the equipment on the basis of prior authorization for the equipment and/or long term experience and demonstrated expertise as an authorized service provider.
17.3 Qualifications and Training of Personnel
17.3.1 Personnel for the work specified in 17.1.1 shall be trained and qualified in the inspection for which they are authorised, for each make and type of equipment for which they provide the inspection.
17.3.2 The education for initial certification of personnel shall be documented and addressed, as a minimum:
(1) Procedures and instructions for the inspection of the watertight cable transit seal systems
(2) Common problems found with the initial installation and in-service inspections of watertight cable transit seal systems
(3) Relevant rules and regulations, including International Conventions
(4) Procedures for reporting on initial installation and in-service inspections of watertight cable transit seal systems in the Cable Transit Seal Systems Register.
17.3.3 The education and training for the personnel shall include practical technical training on actual inspection using the watertight cable transit seal systems for which the personnel are to be certified. The technical training shall include disassembly, reassembly and adjustment of the equipment. Classroom training shall be supplemented by field experience in the inspections for which certification is sought, under the supervision of an experienced senior certified person.
17.3.4 At the time of initial certification and at each renewal of certification, the service supplier shall provide documentation to verify personnel's satisfactory completion of a competency assessment using the equipment for which the personnel are certified.
17.3.5 The Service Supplier shall require refresher training as appropriate to renew the certification.
17.4 Reference Documents
The Service Supplier is to have access to the following documents:
17.4.1 Manufacturer's servicing manuals, servicing bulletins, instructions and training manuals as appropriate.
17.4.2 Type Approval certificate showing any conditions that may be appropriate during the installation or maintenance of the watertight cable transit seal system.
17.5 Equipment and Facilities
The Service Supplier is to have access to the following:
17.5.1 Sufficient tools, and in particular any specialized tools specified in the equipment manufacturer's instructions, including portable tools as needed for work to be carried out on board ship.
17.6 Reporting
17.6.1 On completion of inspection, the Service Supplier will issue a report confirming the condition of the Watertight Cable Transit Seal System. They will also record the results of their inspection in the Cable Transit Seal System Register.

18. Firms engaged in Commissioning Testing of Ballast Water Management Systems (BWMS)

18.1 Extent of engagement - Sampling and Analysis of ballast water and Verification of the self-monitoring equipment during Commissioning Testing of Ballast Water Management Systems (BWMS), for Statutory purposes.
18.2 Procedure
18.2.1 Service suppliers are to have documented procedures including:
— Procedures for sampling collection and handling, analysis, assessment of BWMS correct operations and documenting and reporting. The procedures are to outline how the ballast water sampling and analysis is conducted with respect to each size class of organisms;
— Operating procedures for the ballast water test equipment specified including calibration, adjustment and maintenance.
18.2.2 Service Suppliers are to be familiar with the BWMS operation including features and limits of each treatment technology, and self-monitoring parameters.
18.2.3 Service Suppliers are to be independent of the BWMS manufacturer or supplier including shipyards.
18.3 Operators – Service Suppliers are expected to be able to perform both the biological sampling and

assessment of self-monitoring parameters and has responsibility for document that the requirements to the operator are satisfied. Therefore, operators who conduct commissioning testing are to:
— demonstrate knowledge in the use of different ballast water testing equipment for the purpose of assessing biological efficacy;
— have documented evidence of sufficient engineering and biological knowledge to conduct the commissioning testing;
— have knowledge of IMO BWM.2/Circ.70/Rev.1, as may be amended - 'Guidance for the Commissioning Testing of Ballast Water Management Systems' and IMO BWM.2/Circ.42/Rev.2 - 'Guidance on Ballast Water Sampling and Analysis for Trial Use in accordance with the BWM Convention and Guidelines (G2)', as may be amended;
— (*) be trained in the proper use of portable indicative analysis equipment. Review of training records and/or interviews should be conducted to confirm the equipment will be properly used during testing;
— (*) be trained in the proper use of detailed analysis methods and equipment in case the Service Supplier offers detailed analysis. Review of training records and/or interviews should be conducted to confirm the equipment will be properly used during testing;
— (*) be familiar with and understand the design concepts of the Guidelines G2 sampling devices installed on the vessel's water ballast system. Personnel shall understand the need to maintain the G2 sampling devices clean and free of contaminants and the importance of controlling the ballast water sample flow rates from the G2 device (to avoid organism mortality in the sample);
— (*) be familiar with the technologies utilized by the indicative sampling equipment and understand water quality issues that are both conducive to successful use of the equipment and circumstances that could challenge the use of the equipment;
— (*) be trained in the proper disposal procedures for water samples following testing.
— (Δ) have knowledge of the system design limitations of the BWMS (as stated in the BWMS type approval certificate) and knowledge of the BWMS self-monitoring parameters, such as flow rate, pressure, TRO concentration, UV transmittance/intensity, etc, and how the BWMS notifies the operator in case he operates BWMS outside its system design limitations. This knowledge is relevant for evaluating whether the self-monitoring equipment of the BWMS indicates correct operation of the BWMS. In case Service Supplier are not present during ballasting operations, the Service Supplier shall have knowledge of how to access the BWMS log to evaluate that the BWMS operated correctly during ballasting operations;
— (Δ) have the procedures and knowledge to be able to assess the applicable selfmonitoring parameters (e.g., flow rate, pressure, TRO, UV intensity, etc.) of the BWMS, taking into account the System Design Limitations of the BWMS;

Notes:
(1) the points marked with (*) are qualifications for operators performing sampling and analysis of ballast water;
(2) the points marked with (Δ) are the qualifications for operators performing verification of the self-monitoring equipment ;
(3) the points above without symbol are the common qualifications for service supplier.

18.4 Equipment and facilities

Equipment, procedures and methods for detailed analysis, where applicable, are to be in accordance with relevant International standard and/or accepted Industry standards. Testing should be conducted using indicative analysis equipment accepted by Society. Information and reference to the acceptance documents for the equipment used should be submitted to the Society in the report which includes the results from the commissioning test as per IMO BWM.2/Circ.70/Rev.1, as may be amended. In case the indicative analysis equipment used has not been previously accepted by the Society, the following information is to be submitted to the Society:
• Equipment information - type, model, technology used, evidence of calibration, detection range, Organism type/size classes that can be analyzed.
• Test results conduct for the verification of accuracy, detection range and repeatability.
• Certificate of standards, if available.
For indicative analysis equipment planned to be used, the equipment OEM instruction manuals shall be available. The manuals shall include, at least, clear guidance for the proper storage, handling, operation, maintenance, repair, and calibration.
Note: Each Service Supplier applicant will present the Surveyor their confidential internal procedures for conducting the indicative testing. Not all the equipment listed in the references will be used. For all equipment planned to be used, the instruction manuals shall be available.
The Service Supplier will need to use specialty devices (e.g., sieves, screens, etc.) to separate the different organism sizes classes (i.e., ≥ 10 μm to < 50 μm, and ≥ 50 μm, and indicator microbes) to support analysis of each size class.
Equipment used for the analysis of other physical-chemical water parameters is to be suitable for the

intended use. Indicative analysis equipment should be properly stored or transported to avoid damage and disturbance to calibrations, etc. when transporting from the Service Suppliers facilities to the vessels.

18.5 Sampling and Analysis

Service Suppliers are to follow relevant guidelines on sampling of ballast water. A standard operating procedure is to be defined for sampling of uptake water. Discharge sampling shall follow the IMO's 'Guidelines for Ballast Water Sampling (G2)'. The representative samples shall be analyzed as a minimum for the two size classes of organisms, namely ≥ 50 μm and ≥ 10 μm to < 50 μm, specified in IMO Circular BWM.2/ Circ.70/Rev.1 - Guidance for the Commissioning Testing of Ballast Water Management Systems using indicative analysis methods. Detailed analysis of all organism type/size classes or combination of detail and indicative analysis can also be performed. Service Suppliers shall maintain a record of:

• Operation of the BWMS during test period, including any recorded data or operator observations associated with the performance deviations, alarms or abnormal/unexpected operations.

• Applicable self-monitoring parameters.

In case the commissioning testing requires the Service Supplier's personnel to work in hazardous areas (e.g., pump room for tankers, etc.), the Service Supplier shall have equipment certified for use in such spaces.

18.6 Reporting

Service Suppliers are to provide reports detailing the results of sampling and analysis of ballast water and assessment of self-monitoring parameters during commissioning testing. The format is to be acceptable to CCS. The report, as a minimum, will contain the following:

• Manufacturer's name;

• Model name;

• BWMS Technology limiting operating conditions and system design limitations;

• BWMS treatment mode of operation, e.g., high power, low power, single pass, IMO mode, USCG Mode, etc.;

• Treatment rated capacity (TRC) in m^3/h;

• Relevant performance parameters (e.g. TRO, UV dose, UVI, flow rate or other relevant performance parameter);

• Alarms developed during operation;

• Type Approval issued by and Certificate No.;

• Results of sample analysis;

• Pump and ballast tanks used for the commissioning test, including the flow rates and volumes of the ballasting and deballasting operations;

• Comments/Options: Filter and other major components, Process measurements.

18.7 Reference Documents

The Service Supplier is to have access to the following documents, as may be amended:

• IMO Resolution MEPC.300(72) — Code for Approval of Ballast Water Management Systems (BWMS Code);

• IMO Resolution MEPC.173(58) — Guidelines for Ballast Water Sampling (G2);

• IMO Circular BWM.2/Circ.42/Rev. 2 — Guidance on Ballast Water Sampling and Analysis for Trial Use in accordance with the BWM Convention and Guidelines (G2);

• IMO Circular BWM.2/Circ.70/Rev.1 - Guidance for the Commissioning Testing of Ballast Water Management Systems;

• IMO Circular BWM.2/Circ.61 - Guidance on Methodologies that may be used for Enumerating Viable Organisms for Type Approval of Ballast Water Management Systems;

• IMO Circular BWM.2/Circ.69 - Guidance on System Design Limitations of Ballast Water Management Systems and their Monitoring;

• IMO Resolution A.1156(32) – Survey Guidelines under the Harmonized System of Survey and Certification (HSSC), as amended (for BWMS that were Type Approved to the 2016 G8).

Appendix 9 CALIBRATION OF MEASURING EQUIPMENT

1. General requirements

1.1 Inspection, measuring and test equipment, which CCS Surveyors rely on to make decisions affecting classification or statutory certification, are to be individually identified and calibrated to a recognized national or international standard.

2. Simple measuring equipment

2.1 Simple measuring equipment means rulers, measuring tapes, weld gauges, micrometers, etc.

2.2 The Surveyor may accept simple measuring equipment without individual identification or confirmation of calibration, provided they are of standard commercial design approved by the State metrology service, properly maintained and periodically compared with other similar equipment or test pieces.

3. Shipboard equipment

3.1 The Surveyor may accept equipment fitted on board a ship and used in examination of shipboard equipment (e.g. pressure, temperature or rpm gauges and meters) based either on calibration records or comparison of readings with multiple instruments.

4. Other equipment

4.1 The Surveyor is to satisfy himself that other equipment (e.g. tensile test machines, ultrasonic thickness measurement equipment, etc.) is calibrated to a recognized national or international standard.

Appendix 10 PROCEDURES FOR CERTIFICATION OF FIRMS ENGAGED IN THICKNESS MEASUREMENT OF HULL STRUCTURES

1. Application

1.1 Appendix 8 of this Chapter and this guidance apply to certification of the firms which intend to engage in the thickness measurement of hull structures of the ships.

2. Procedures for certification

2.1 Submission of documents

2.1.1 The following documents are to be submitted to CCS for approval:

a. outline of firms, e.g. organization and management structure;

b. experiences of the firms on thickness measurement inter alia of hull structures of the ships;

c. technicians' careers, i.e. experiences of technicians as thickness measurement operators, technical knowledge of hull structure etc. Operators are to be qualified according to a recognized industrial NDT Standard;

d. equipment used for thickness measurement such as ultra-sonic testing machines and its maintenance/calibration procedures;

e. a guide for thickness measurement operators;

f. training programmes of technicians for thickness measurement.

2.1.2 Auditing of the firms: Upon reviewing the documents submitted with satisfactory results, the firm is to be audited on site by CCS in order to ascertain that the firm is duly organized and managed in accordance with the documents submitted, and eventually is capable of conducting thickness measurement of the hull construction of the ships.

2.1.3 Assessment of thickness measurement operation: Certification is to be made by CCS on an onboard demonstration at thickness measurements as well as satisfactory reporting.

3. Certification

3.1 Upon satisfactory results of both the audit of the firm in 2.1.2 and the demonstration tests in 2.1.3 above, CCS will issue a certificate of approval as well as a notice to the effect that the thickness measurement operation system of the firm has been certified by CCS.

3.2 Renewal/endorsement of the certificate is to be made at intervals not exceeding 3 years by verification that original conditions are maintained.

4. Control of any alteration to the certified thickness measurement operation system

4.1 In case where any alteration to the certified thickness measurement operation system of the firm is made, such an alteration is to be immediately informed to CCS. Re-audit is made where deemed necessary by CCS.

5. Cancellation of approval

5.1 Approval will be cancelled in the following cases:

(1) where the measurements were improperly carried out or the results were improperly reported;

(2) where CCS Surveyor found any deficiencies in the approved thickness measurement operation systems of the firm;

(3) where the firm failed to inform any alteration in 4 above to CCS.

Appendix 11 ESP SURVEY REPORTING PRINCIPLES

As a principle, for ships which are subject to the enhanced survey programme (ESP) of Appendix 2, Chapter 2 of this PART, the Surveyor is to include the following content in his report for survey of hull structure and piping systems, as relevant for the survey.

1. General

1.1 A survey report is to be generated in the following cases:

(1) in connection with commencement, continuation and/or completion of periodical hull surveys, i.e. annual, intermediate and special surveys, as relevant;

(2) when structural damages/defects have been found;

(3) when repairs, renewals or modifications have been carried out;

(4) when condition of class has been imposed or deleted.

1.2 The purpose of reporting is to provide:

(1) evidence that prescribed surveys have been carried out in accordance with applicable classification rules;

(2) documentation of surveys carried out with findings, repairs carried out and condition of class imposed or deleted;

(3) survey records, including actions taken, which are to form an auditable documentary trail. Survey reports are to be kept in the survey report file required to be on board;

(4) information for planning of future surveys;

(5) information which may be used as input for maintenance of classification rules and instructions.

1.3 When a survey is split between different survey stations, a report is to be made for each portion of the survey. A list of items inspected and/or tested (pressure test, thickness measurement, etc.) and an indication of whether the item has been credited is to be made available to the next attending Surveyor, prior to continuing or completing the survey. Thickness measurement and tank testing carried out is also to be listed for the next Surveyor.

2. Extent of the survey

2.1 Identification of compartments where an overall survey has been carried out.

2.2 Identification of locations, in each tank (for oil tanker and chemical carrier)/ballast tank and cargo hold (for bulk carrier) including hatch covers and coamings, where a close-up survey has been carried out, together with information of the means of access used.

2.3 Identification of locations, in each tank (for oil tanker and chemical carrier)/ballast tank and cargo hold (for bulk carrier) including hatch covers and coamings, where thickness measurement has been carried out.

Note: As a minimum, the identification of location of close-up survey and thickness measurement is to include a confirmation with description of individual structural members corresponding to the extent of requirements stipulated in Sections 6, 7 and 8 of this Chapter based on type of periodical survey and the ship's age.

Where only partial survey is required, i.e. one web frame ring/one deck transverse (for oil tankers), 25% of shell frames, one transverse web and two selected cargo hold transverse bulkheads (for bulk carriers), the identification is to include location within each tank (for oil tanker and chemical carrier)/ballast tank and cargo hold (for bulk carrier) by reference to frame numbers.

2.4 For areas in where protective coating is found to be in GOOD condition within a tank (for oil tanker and chemical carrier)/ballast tank and cargo hold (for bulk carrier) and the extent of close-up survey and/or thickness measurement has been specially considered, structures subject to special consideration are to be identified.

2.5 Identification of tanks subject to tank testing.

2.6 Identification of piping systems on deck, including crude oil washing (COW) piping for oil tankers, and within cargo holds, ballast tanks, pipe tunnels, cofferdams and void spaces where:

(1) examination including internal examination of piping with valves and fittings and thickness measurement, as relevant, has been carried out;

(2) operational test to working pressure has been carried out.

3. Result of the survey

3.1 Type, extent and condition of protective coating in each tank, as relevant (rated GOOD, FAIR or POOR) including identification of tanks fitted with anodes.

3.2 Structural condition of each compartment with information on the following, as relevant:

(1) Identification of findings, such as:
— corrosion with description of location, type and extent;
— areas with substantial corrosion;
— cracks/fractures with description of location and extent;
— buckling with description of location and extent;
— indents with description of location and extent.
(2) Identification of compartments where no structural damages/defects are found.
(3) The report may be supplemented by sketches/photos.
3.3 Thickness measurement report is to be verified and signed by the Surveyor controlling the measurements on board.
3.4 Evaluation result of longitudinal strength of the hull girder of oil tankers of 130 m in length and upwards and over 10 years of age. The following data is to be included, as relevant:
(1) measured and as-built transverse sectional areas of deck and bottom flanges;
(2) diminution of transverse sectional areas of deck and bottom flanges;
(3) details of renewals or reinforcements carried out, as relevant (as per 4.2).

4. Actions taken with respect to findings
4.1 Whenever the attending Surveyor is of the opinion that repairs are required, each item to be repaired is to be identified in the survey report. Whenever repairs are carried out, details of the repairs effected are to be reported by making specific reference to relevant items in the the survey report.
4.2 Repairs carried out are to be reported with identification of:
(1) compartment;
(2) structural member;
(3) repair method (i.e. renewal or modification);
① steel grades and scantlings (if different from the original);
② sketches/photos, as appropriate;
(4) repair extent;
(5) NDT/tests.
4.3 For repairs not completed at the time of survey, condition of class is to be imposed with a specific time limit for the repairs. In order to provide correct and proper information to the Surveyor attending for survey of the repairs, condition of class is to be sufficiently detailed with identification of each item to be repaired. For identification of extensive repairs, reference may be given to the survey report.

Report 1
EXECUTIVE HULL SUMMARY FOR OIL TANKER/CHEMICAL TANKER
(Issued upon Completion of Special Survey)

General particulars

Ship's name		Class identify number	
Port of registry		IMO identify number	
Deadweight (t)		National flag	
Date of build		Gross tonnage	
Date of major conversion		Classification notation	
Type of conversion		Owner	

a) The survey reports and documents listed below have been reviewed by the undersigned and found to be satisfactory.
b) A summary of the survey is attached herewith on sheet 2.
c) The hull special survey has been completed in accordance with the Rules on [date].

Executive Summary Report completed by:	Name: Signature:	Title:
OFFICE	DATE	
Executive Summary Report verified by:	Name: Signature:	Title:

EXECUTIVE HULL SUMMARY

A) General particulars:	– Refer to previous page
B) Report review:	– Where and how survey was done
C) Close-up survey:	– Extent (which tanks)
D) Cargo & ballast piping system	– Examined
	– Operationally tested
E) Thickness measurements:	– Reference to thickness measurement report
	– Summary of where measured
	– Separate form indicating the tanks/areas with substantial corrosion, and corresponding
	* Thickness diminution
	* Corrosion pattern
F) Tank protection	Separate form indicating:
	– Location of coating
	– Condition of coating (if applicable)
G) Repairs:	– Identification of tanks/areas
H) Condition of class:	
I) Memoranda:	– Acceptable defects
	– Any points of attention for future surveys, e.g. for suspect areas
	– Examination of ballast tanks at annual surveys due to coating breakdown

J) Evaluation results of the ship's longitudinal strength (for oil tankers of 130 m in length and upwards and of over 10 years of age)

K) Conclusion	– Statement on evaluation/verification of survey report

EXTRACT OF THICKNESS MEASUREMENTS (NON-CSR SHIPS)

(Reference is made to the thickness measurements report)

1) Positions of substantially corroded tanks/areas or areas with deep pitting	Thickness diminution [%]	2) Corrosion pattern	Remarks: e.g. ref. attached sketches

Remarks:

1) Substantial corrosion, i.e. 75% to 100% of acceptable margins wasted.

2) P = Pitting;

C = Corrosion in general.

Any bottom plating with a pitting intensity of 20% or more, with wastage in the substantial corrosion range or having an average depth of pitting of 1/3 or more of actual plate thickness is to be noted.

EXTRACT OF THICKNESS MEASUREMENTS (CSR SHIPS)

(Reference is made to the thickness measurements report)

1) Positions of substantially corroded tanks/areas or areas with deep pitting	$t_m - t_{ren}$ (mm)	2) Corrosion pattern	Remarks: e.g. ref. attached sketches

Remarks:

1) Substantial corrosion, an extent of corrosion such that the assessment of the corrosion pattern indicates a measured thickness between t_{ren} + 0.5mm and t_{ren}.

2) P = Pitting C = Corrosion in general

Areas with deep pitting assessed according to 5.1.17, Chapter 5 of this PART are to be recorded in this column.

TANK PROTECTION

1) Tank Nos.	2) Tank protection	3) Coating condition	Remarks

Remarks:
1) All segregated ballast tanks and combined cargo/ballast tanks to be listed.
2) C = Coating; NP = No Protection.
3) Coating condition according to the following standard:
GOOD condition with only minor spot rusting;
FAIR condition with local breakdown at edges of stiffeners and weld connections and/or light rusting over 20% or more of areas under consideration, but less than as defined for POOR condition;
POOR condition with general breakdown of coating over 20% or more of areas or hard scale at 10% or more of areas under consideration.

For ballast tanks, if coating condition less than "GOOD" is given, tanks are to be examined at annual surveys. This is to be noted in part I) of the Executive Hull Summary.

Evaluation result of longitudinal strength of the hull girder of oil tankers of 130 m in length and upwards and of over 10 years of age
(Of sections 1, 2 and 3 below, only one applicable section is to be completed)

1 This section applies to ships regardless of the date of construction: Transverse sectional areas of deck flange (deck plating and deck longitudinals) and bottom flange (bottom shell plating and bottom longitudinals) of the ship's hull girder have been calculated by using the thickness measured, renewed or reinforced, as appropriate, during the special survey most recently conducted after the ship reached 10 years of age, and found that the diminution of the transverse sectional area does not exceed 10% of the as-built area, as shown in Table 1:

Transverse Sectional Area of Hull Girder Flange **Table 1**

		Measured	As-built	Diminution
Transverse section 1	Deck flange	cm^2	cm^2	cm^2 (%)
	Bottom flange	cm^2	cm^2	cm^2 (%)
Transverse section 2	Deck flange	cm^2	cm^2	cm^2 (%)
	Bottom flange	cm^2	cm^2	cm^2 (%)
Transverse section 3	Deck flange	cm^2	cm^2	cm^2 (%)
	Bottom flange	cm^2	cm^2	cm^2 (%)

2 This section applies to ships constructed on or after 1 July 2002: Section moduli of transverse section of the ship's hull girder have been calculated by using the thickness of structural members measured, renewed or reinforced, as appropriate, during the special survey most recently conducted after the ship reached 10 years of age in accordance with the provisions of 2.2.1(1) of Appendix 2 of this Chapter, and are found to be within their diminution limits determined by CCS①, as shown in Table 2:

Transverse Section Modulus of Hull Girder **Table 2**

		Z_{act} (cm^3) (1)	Z_{req} (cm^3) (2)	Remarks
Transverse section 1	Upper deck			
	Bottom			
Transverse section 2	Upper deck			
	Bottom			
Transverse section 3	Upper deck			
	Bottom			

Notes: (1) Z_{act} means the actual section moduli of the transverse section of the ship's hull girder calculated by using the thickness of structural members measured, renewed or reinforced, as appropriate, during the special survey, in accordance with the provisions of 2.2.1(1) of Appendix 2 of this Chapter.
(2) Z_{req} means diminution limit of the longitudinal bending strength of ships, as calculated in accordance with the provisions of 2.2.1(1) of Appendix 2 of this Chapter. The calculation sheets for Zact are to be attached to this report.

3 This section applies to ships constructed before 1 July 2002: Section moduli of transverse section of the ship's hull girder have been calculated by using the thickness of structural members measured, renewed or reinforced, as appropriate, during the special survey most recently conducted after the ship reached 10 years of age in accordance with the provisions of 2.2.1(2) of Appendix 2 of this Chapter, and found to meet the criteria required by CCS and that Z_{act} is not less than Z_{mc} (defined in note 2 of Table 3) as specified in Annex 2 to Appendix 2 of this PART, as shown in Table 3. Describe the criteria for acceptance of the minimum section moduli of the ship's hull girder for ships in service required by CCS.

Transverse Section Modulus of Hull Girder **Table 3**

		Z_{act} (cm^3) (1)	Z_{mc} (cm^3) (2)	Remarks
Transverse section 1	Upper deck			
	Bottom			
Transverse section 2	Upper deck			
	Bottom			
Transverse section 3	Upper deck			
	Bottom			

Notes: (1) As defined in note *1 of Table 2.
(2) Z_{mc} means the diminution limit of minimum section modulus calculated in accordance with provisions of 2.2.1(2) of Appendix 2 of this Chapter.

---

① The actual transverse section modulus of the hull girder of oil tankers calculated under 2.2.1(1) of Appendix 2 of this Chapter is not to be less than 90% of the required section modulus for new buildings specified in IACS Unified Requirements S7 (C = 1.0 C_n is to be used for the purpose of this calculation.) or S11, whichever is the greater.

Report 2
EXECUTIVE HULL SUMMARY FOR BULK CARRIER
(Issued upon Completion of Special Survey)

SPACE PROTECTION

1) Tank/hold/void Nos.	2) Tank/hold/void protection	3) Coating condition	Remarks

Remarks:
1) All ballast tanks, cargo holds and double-side skin void spaces to be listed.
2) C = Coating; NP = No Protection
3) Coating condition according to the following standard:

GOOD condition with only minor spot rusting;
FAIR condition with local breakdown at edges of stiffeners and weld connections and/or light rusting over 20% or more of areas under consideration, but less than as defined for POOR condition;
POOR condition with general breakdown of coating over 20% or more of areas or hard scale at 10% or more of areas under consideration.

For ballast tanks, if coating condition less than "GOOD" is given, tanks are to be examined at annual surveys. This is to be noted in part H) of the Executive Hull Summary.
For double-side skin void spaces on bulk carriers exceeding 20 years of age and of 150 m in length and upwards, if coating condition POOR is given, those voids are to be examined at annual surveys. This is to be noted in part H of Executive Hull Summary.

Appendix 11A SURVEY PROGRAMME

Basic information and particulars

Name of ship:
IMO number:
Flag State:
Port of registry:
Gross tonnage:
Deadweight (t):
Length between perpendiculars (m):
Shipbuilder:
Hull number:
Classification society:
Class ID:
Date of delivery of the ship:
Owner:
Thickness measurement company:

1 Preamble

1.1 Scope

(1) The present survey programme covers the minimum extent of overall surveys, close-up surveys, thickness measurements and pressure testing within the cargo (length) area, cargo holds, ballast tanks, including fore and aft peak tanks, required by Sections 6 to 8 of this Chapter.

(2) The arrangements and safety aspects of the survey should be acceptable to the attending Surveyor(s).

1.2 Documentation

All documents used in the development of the survey programme should be available onboard during the survey as required by 5.1.7 of this Chapter.

2 Arrangement of cargo holds, tanks and spaces

This section of the survey programme should provide information (either in the form of plans or text) on the arrangement of cargo holds, tanks and spaces that fall within the scope of the survey.

3 List of cargo holds, tanks and spaces with information on their use, extent of coatings and corrosion protection system

This section of the survey programme should indicate any changes relating to (and should update) the information on the use of the holds and tanks of the ship, the extent of coatings and the corrosion protective system provided in the Survey Planning Questionnaire set out in Appendix 11B of this Chapter.

4 Conditions for survey

This section of the survey programme should provide information on the conditions for survey, e.g. information regarding cargo hold and tank cleaning, gas freeing, ventilation, lighting, etc.

5 Provisions and method of access to structures

This section of the survey programme should indicate any changes relating to (and should update) the information on the provisions and methods of access to structures provided in the Survey Planning Questionnaire set out in Appendix 11B of this Chapter.

6 List of equipment for survey

This section of the survey programme should identify and list the equipment that will be made available for carrying out the survey and the required thickness measurements.

7 Survey requirements

7.1 Overall survey

This section of the survey programme should identify and list the spaces that should undergo an overall survey for this ship in accordance with Sections 6 to 8 of this Chapter.

7.2 Close-up survey

This section of the survey programme should identify and list the hull structures that should undergo a close-up survey for this ship in accordance with Sections 6 to 8 of this Chapter.

8 Identification of tanks for tank testing

This section of the survey programme should identify and list the cargo holds and tanks that should undergo tank testing for this ship in accordance with Sections 6 to 8 of this Chapter.

9 Identification of areas and sections for thickness measurements

This section of the survey programme should identify and list the areas and sections where thickness measurements should be taken in accordance with Sections 6 to 8 of this Chapter.

10 Minimum thickness of hull structures

This section of the survey programme should specify the minimum thickness for hull structures of this ship that are subject to survey, (indicate either (1) or preferably (2), if such information is available):

(1) determined from the attached wastage allowance table and the original thickness to the hull structure plans of the ship;

(2) given in the following Table(s):

Area or location	Applicable ship type			Original as-built thickness (mm)	Minimum thickness (mm)	Substantial corrosion thickness (mm)
	B	**O**	**C**			
Deck	X	X	X			
Plating	X	X	X

Notes: The wastage allowance tables are to be attached to the survey programme.

X – applicable; X_p – if applicable; B – bulk carrier; O – oil tanker; C – chemical tanker.

For CSR ships, the renewal thickness of the hull structure elements is to be indicated in the appropriate drawings.

11 Thickness measurement company

This section of the survey programme should identify changes, if any, relating to the information on the thickness measurement company provided in the Survey Planning Questionnaire.

12 Damage experience related to the ship

This section of the survey programme should, using the tables provided below, provide details of the hull damages for at least the last three years in way of the cargo holds, ballast tanks and void spaces within the cargo length area. These damages are subject to survey.

Hull Damages Sorted by Location for This Ship

Cargo hold, tank or space number or area	Possible cause, if known	Description of the damages	Location	Repair	Date of repair

Hull Damages for Sister or Similar Ships (if available) in the Case of Design Related Damage

Cargo hold, tank or space number or area	Possible cause, if known	Description of the damages	Location	Repair	Date of repair

13 Areas identified with substantial corrosion from previous surveys

This section of the survey programme should identify and list the areas of substantial corrosion from previous surveys.

14 Critical structural areas and suspect areas

This section of the survey programme should identify and list the critical structural areas and the suspect areas, when such information is available.

15 Other relevant comments and information

This section of the survey programme should provide any other comments and information relevant to the survey.

Appendices

Appendix 1 − List of plans

5.1.6.5(3) of this Chapter requires that main structural plans of cargo holds and ballast tanks (scantling drawings), including information regarding use of high tensile steel (HTS), clad steel and stainless steel should be available.

This Appendix of the survey programme should identify and list the main structural plans which form part of the survey programme.

Appendix 2 − Survey Planning Questionnaire

The Survey Planning Questionnaire (Appendix 11B of this Chapter), which has been submitted by the

owner, should be appended to the survey programme.

Appendix 3 − Other documentation

This part of the survey programme should identify and list any other documentation that forms part of the plan.

Prepared by the owner in co-operation with CCS for compliance with 5.1.6.5(3) of this Chapter:
Date: ..... (name and signature of authorized owner's representative)
Date: ..... (name and signature of CCS Surveyor).

Appendix 11B SURVEY PLANNING QUESTIONNAIRE

(Bulk Carriers/Oil Tankers/Chemical tankers)

1 The following information will enable the owner in co-operation with CCS to develop a survey programme complying with the requirements of this Chapter. It is essential that the owner provides, when completing the present questionnaire, up-to-date information. The present questionnaire, when completed, is to provide all information and material required by this Chapter.

Particulars

Ship's name:

Date of build:

Information on access provision for close-up surveys and thickness measurement

2 The owner is to indicate, in the table below, the means of access to the structures subject to close-up survey and thickness measurement.

Hold/ Tank No.	Structure	①C (Cargo)/B (ballast tank)	Permanent means of access	Temporary means of access	Rafts	Ladders	Direct access	Other means (please specify)
F.P. (oil tankers/ bulk carriers/ chemical tankers)	Fore peak							
A.P. (oil tankers/ bulk carriers/ chemical tankers)	Aft peak							
Cargo holds (bulk carriers)	Hatch side coamings							
	Topside sloping plate							
	Upper stool plating							
	Cross deck							
	Side shell, frames & brackets							
	Transverse bulkhead							
	Hopper tank platting							
	Lower stool							
	Tank top plating							
Wing tanks (oil tankers/ chemical tankers)	Under deck							
	Side shell							
	Bottom transverse							
	Longitudinal							
	Transverse							
Center tanks (oil tankers/	Under deck							
	Bottom							

Hold/ Tank No.	Structure	①C (Cargo)/B (ballast tank)	Permanent means of access	Temporary means of access	Rafts	Ladders	Direct access	Other means (please specify)
chemical tankers)	transverse							
	Transverse							
Topside tanks (bulk carriers)	Underdeck structure							
	Side shell & structure							
	Sloping plate & structure							
	Webs & bulkheads							
Double side skin tanks (double skin bulk carriers)	Side shell & structure							
	Inner skin & structure							
	Webs and bulkheads							
Hopper tanks (bulk carriers)	Hopper sloping plate & structure							
	Side shell & structure							
	Bottom structure							
	Webs & bulkheads							
	Double bottom structure (bulk carriers)							
	Upper stool internal structure (bulk carriers)							
	Lower stool internal structure (bulk carriers)							
Wing tanks of ore carriers	Underdeck & structure							
	Side shell & structure							
	Side shell vertical web & structure							
	Longitudinal bulkhead & structure							
	Longitudinal bulkhead web & structure							
	Bottom plating & structure							
	Cross ties/stringers							

History of cargoes②

① Applicable to oil tankers.

② For bulk carriers, history of bulk cargoes of a corrosive nature (e.g. high sulphur content) for bulk carriers;
For oil tankers, history of cargo with H_2S content or heated cargo for the last 3 months together with indication as to whether cargo was heated and, where available, Marine Safety Data Sheets (MSDS)*;
For chemical tankers, history of heated cargo for the last 3 years together with indication as to whether cargo was heated.

* Refer to resolution MSC.150(77) on Recommendation for Material Safety Data Sheets for MARPOL Annex I Cargoes and Marine Fuel Oils.

Owner's inspections

3 Using a format similar to that of the table below (which is given as an example), the owner is to provide details of the results of their inspections for the last 3 years on all cargo and ballast tanks and void spaces within the cargo area in accordance with the requirements of this Chapter.

Tank/Hold No.	Corrosion protection (1)	Coating extent (2)	Coating condition (3)	Structural deterioration (4)	Hold and tank history (5)
Cargo holds (bulk carriers)					
Cargo centre tanks (oil tankers/ chemical tankers)					
Cargo wing tanks (oil tankers/ chemical tankers)					
Slop tanks (oil tankers)					
Topside tanks (bulk carriers)					
Hopper tanks (bulk carriers)					
Double side skin tanks (bulk carriers)					
Double bottom tanks (bulk carriers)					
Upper stools (bulk carriers)					
Lower stools (bulk carriers)					
Wing tanks (ore carriers)					
Ballast tanks (oil tankers/ chemical tankers)					
Fore peak (oil tankers/bulk carriers/ chemical tankers)					
Aft peak (oil tankers/bulk carriers/ chemical tankers)					
Miscellaneous other spaces (oil tankers/ bulk carriers/ chemical tankers)					

Note: Indicate tanks which are used for oil/ballast.

1) HC = hard coating; SC = soft coating; SH = semi-hard coating; NP = no protection
2) U = upper part; M = middle part; L = lower part; C = complete
3) G = good; F = fair; P = poor; RC = recoated (during the last 3 years)
4) N = no findings recorded; Y = findings recorded (Description of findings is to be attached to this questionnaire)
5) DR = Damage & Repair; L = Leakages; CV = Conversion (Description to be attached to this questionnaire)

Date:

Reports of Port State Control inspections

List the reports of Port State Control inspections containing hull structural related deficiencies and relevant information on rectification of the deficiencies:

Safety Management System

List non-conformities related to hull maintenance, including the associated corrective actions:

Name and address of the approved thickness measurement company:

Appendix 12 GUIDELINES FOR TECHNICAL ASSESSMENT IN CONJUNCTION WITH PLANNING FOR ENHANCED SURVEYS AND OWNER'S INSPECTION REPORT

1 Guidelines for technical assessment in conjunction with planning for enhanced surveys

1.1 Introduction

These guidelines contain information and suggestions concerning technical assessments, which may be of use in conjunction with the planning of enhanced special surveys of oil tankers, bulk carriers and chemical tankers. See 5.1.6.5(5) of this Chapter①.The guidelines are a recommended tool which may be invoked at the discretion of CCS, when considered necessary and appropriate, in conjunction with the preparation of the required survey programme.

1.2 Purpose and principles

1.2.1 The purpose of the technical assessments described in these guidelines is to assist in identifying critical structural areas, nominating suspect areas and in focusing attention on structural elements or areas of structural elements which may be particularly susceptible to, or evidence a history of, wastage or damage. This information may be useful in nominating locations, areas, holds and tanks for thickness measurement, close-up survey and tank testing.

1.2.2 These guidelines may not be used to reduce the requirements pertaining to thickness measurement, close-up survey and tank testing contained in Sections 6, 7 and 8, Chapter 5 of this PART, which are, in all cases, to be complied with as a minimum.

1.2.3 As with other aspects of survey planning, the technical assessments described in these guidelines should be worked out by the owner or operator in cooperation with CCS well in advance of the commencement of the special survey, i.e. prior to commencing the survey and normally at least 12 to 15 months before the survey's completion due date.

1.2.4 Aspects to be considered

1.2.4.1 Technical assessments, which may include quantitative or qualitative evaluation of relative risks of possible deterioration of the following aspects of a particular ship, may be used as a basis for the nomination of holds, tanks and areas for survey:

(1) design features such as stress levels on various structural elements, design details and extent of use of high tensile steel;

(2) former history with respect to corrosion, cracking, buckling, indents and repairs for the particular ship as well as similar ships, where available;

(3) information with respect to types of cargo carried, use of different holds/tanks for cargo/ballast, protection of holds and tanks and condition of coating, if any.

1.2.4.2 Technical assessments of the relative risks of susceptibility to damage or deterioration of various structural elements and areas are to be judged and decided on the basis of recognized principles and practices, such as may be found in publications of Tanker Structure Cooperative Forum (TSCF), (Refs.2 and 3)② and Bulk Carriers-Guidelines for Surveys, Assessment and Repair of Hull Structure (IACS), (Ref. 4).

1.3 Technical assessment

1.3.1 General requirements

1.3.1.1 There are three basic types of possible failure, which may be the subject of technical assessment in connection with planning of surveys: corrosion, cracks and buckling. Contact damages are not normally covered by the survey planning since indents are usually noted in memoranda and assumed to be dealt with as a normal routine by Surveyors.

1.3.1.2 Technical assessments performed in conjunction with the survey planning process are, in principle,

---

① Ref.1: For hull survey of chemical tankers, see Section 8 of this Chapter. For hull survey of oil tankers and bulk carriers, see TSCF Guidance Manual for the Inspection and Condition Assessment of Tanker Structures (1986). For hull survey of double hull oil tankers, see IACS Rec 96 Double Hull Oil Tankers – Guidelines for Surveys, Assessment and Repair of Hull Structures, 2019. For hull survey of double-side skin bulk carriers, see IACS Rec 76 IACS Guidelines for Surveys, Assessment and Repair of Hull Structure – Bulk Carriers, 2007.

② Ref.2: For hull survey of oil tankers and bulk carriers, see TSCF Condition Evaluation and Maintenance of Tanker Structures (1992). For hull survey of chemical tankers, double hull oil tankers and double-side skin bulk carriers, see TSCF Guidelines for the Inspection and Maintenance of Double Hull Tanker Structures (1995); Ref.3: For hull survey of chemical tankers, double hull oil tankers and double-side skin bulk carriers, see TSCF Guidance Manual for Tanker Structures (1997). For hull survey of bulk carriers, see IACS Rec 76 IACS Guidelines for Surveys, Assessment and Repair of Hull Structure – Bulk Carriers, 2007.

to be as shown schematically in Figure 1.3.1.2, which indicates how to perform technical assessments in conjunction with the survey planning process.
The approach is basically an evaluation of the risk based on the knowledge and experience related to design and corrosion.
The design is to be considered with respect to structural details, which may be susceptible to buckling or cracking as a result of vibration, high stress levels or fatigue.
Corrosion is related to the ageing process, and is closely connected with the quality of corrosion prevention systems fitted at newbuilding, and subsequent maintenance during the service life. Corrosion may also lead to cracking and/or buckling.

1.3.2 Methods

1.3.2.1 Design details

Damage experience related to the ship in question and sister and similar ships, where available, is the main source of information to be used in the process of planning. In addition, a selection of structural details from the design drawings is to be included.
Typical damage experience to be considered will consist of:
— number, extent, location and frequency of cracks;
— location of buckles.
This information may be found in the survey reports and/or the owner's files, including the results of the owner's own inspections. The defects are to be analyzed, noted and marked on sketches.
In addition, general experience is to be utilized. For example, reference is to be made to TSCF's two publications (Refs.2 and 3) and IACS's "Bulk Carriers: Guidelines for Survey, Assessment and Repair of Hull Structures" (Ref. 4) which contains a catalogue of typical damages and proposed repair methods for various structural details of tankers and bulk carriers.
Such figures are to be used together with a review of the main drawings, in order to compare with the actual structure and search for similar details that may be susceptible to damage. Reference is made to examples in Figures 1.3.2.1(1) to (3). In particular, Chapter 3 of Ref. 2 deals with various aspects specific to double hull tankers, such as stress concentration locations, misalignment during construction, corrosion trends, fatigue considerations and areas requiring special attention, which are to be considered in working out the survey planning.
The review of the main structural drawings, in addition to using the above-mentioned figures, is to include checking for typical design details where cracking has been experienced. The factors contributing to damage are to be carefully considered.
The use of high tensile steel (HTS) is an important factor. Details showing good service experience where ordinary, mild steel has been used may be more susceptible to damage when HTS, and its higher associated stresses, are utilized. There is extensive and, in general, good experience, with the use of HTS for longitudinal material in deck and bottom structures. Experience in other locations, where the dynamic stresses may be higher, is less favourable, e.g. side structures.
In this respect, stress calculations of typical and important components and details, in accordance with the latest Rules or other relevant methods may prove useful and are to be considered.
The selected areas of the structure identified during this process should be recorded and marked on the structural drawings to be included in the survey programme.

1.3.2.2 Corrosion

In order to evaluate relative corrosion risks, the following information is generally to be considered:
— usage of tanks, holds and spaces;
— condition of coatings;
— cleaning procedures;
— previous corrosion damage;
— ballast use and time for oil cargo holds/cargo holds;
— planning of risk of corrosion (referring to Ref. 3). Special attention is to be given to the areas where the double hull tanker is particularly exposed to corrosion. To this end, the specific aspects addressing corrosion in double hull tankers indicated in 3.4 (Corrosion trends) of Ref. 2 are to be taken into account;
— location of heated tanks.
Ref. 3 gives definitive examples which can be used for judging and describing coating condition, using typical pictures of conditions.
The evaluation of corrosion risks is to be based on information in Ref.3, together with relevant information on the anticipated condition of the ship as derived from the information collected in order to prepare the survey programme and the age of the ship.
The various holds, tanks and spaces are to be listed with the corrosion risks nominated accordingly.

1.3.2.3 Locations for close-up survey and thickness measurement

On the basis of the table of corrosion risks and the evaluation of design experience, the locations for initial close-up survey and thickness measurement (areas and sections) may be nominated.

The sections subject to thickness measurement are to normally be nominated in tanks, holds and spaces where corrosion risk is judged to be the highest.

The nomination of tanks, holds and spaces for close-up survey is to, initially, be based on highest corrosion risk, and is to always include ballast tanks. The principle for the selection is to be that the extent is increased by age or where information is insufficient or unreliable.

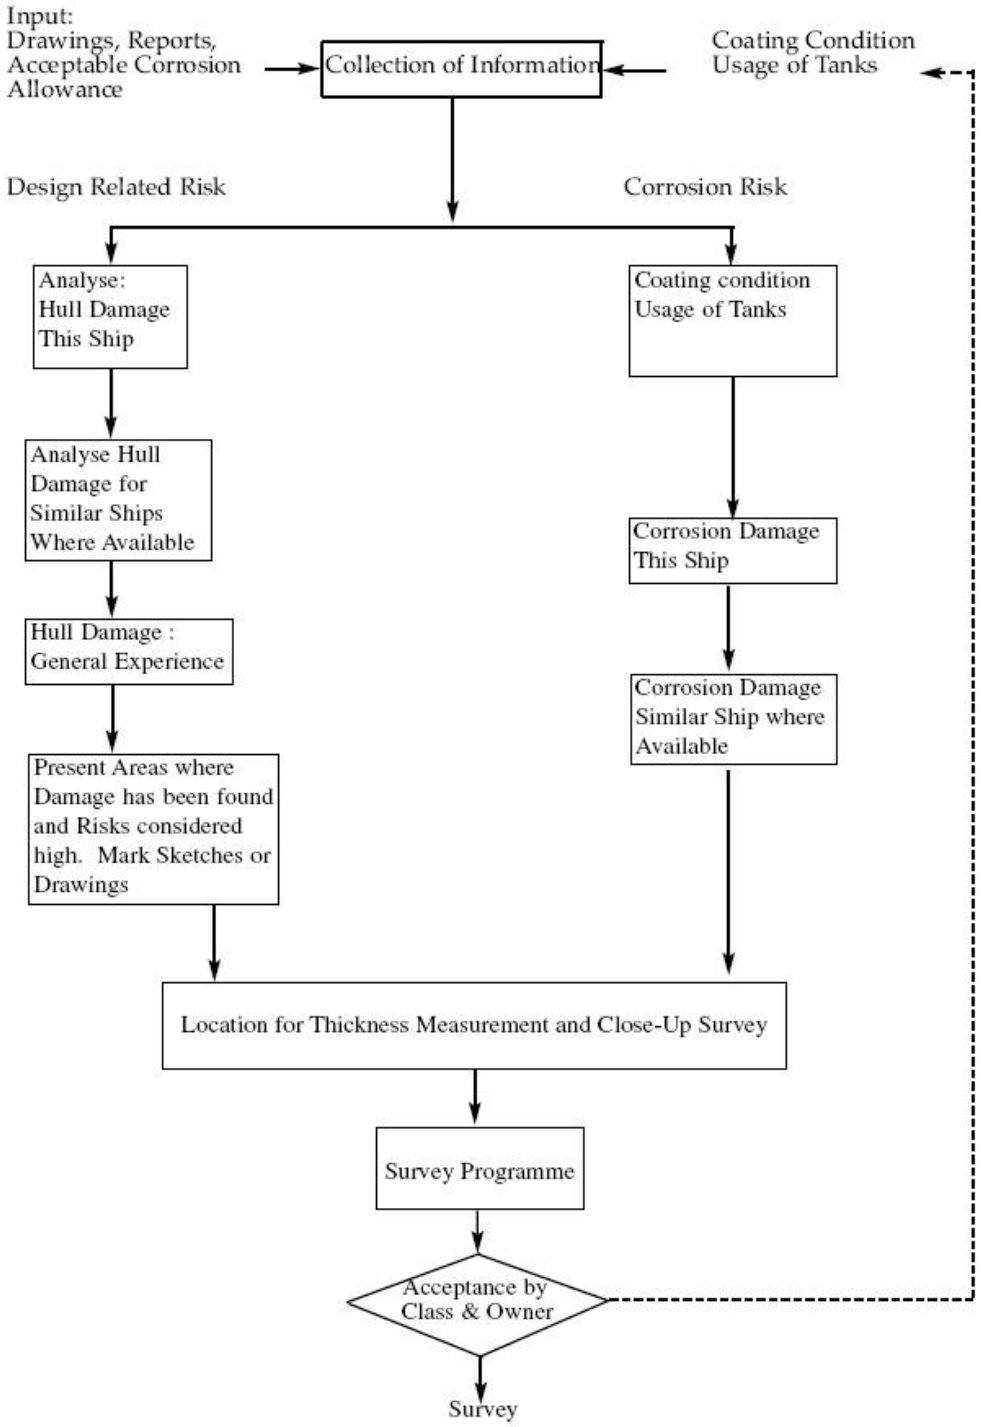

Figure 1.3.1.2 Technical Assessment & the Survey Planning Process

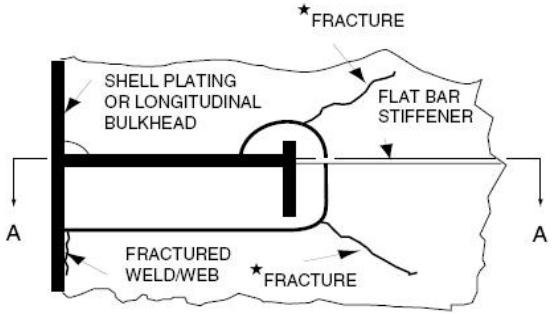
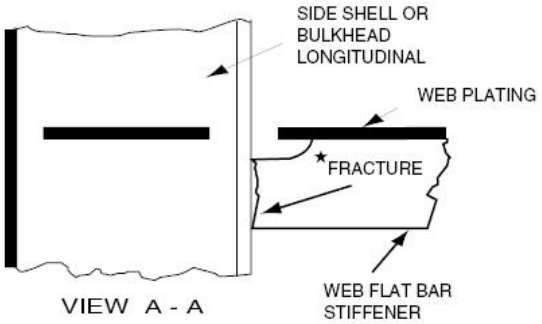
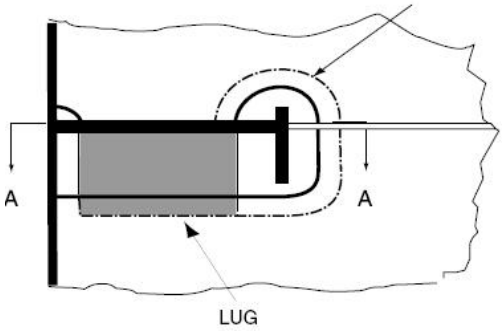
Location: Connection of longitudinals to transverse webs Example No.1 : Web and flat bar fractures at cut-outs for longitudinal stiffener connections	
Typical Damage	Proposed Repair

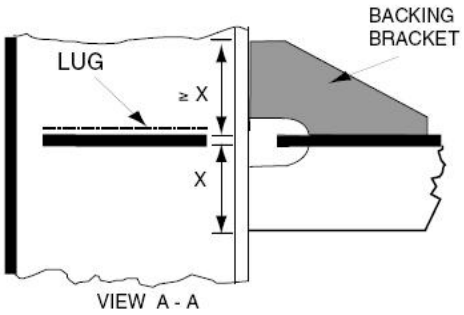




Note: One or more fractures may occur

Full collar if fractures in web plate are small and are repaired by welding





Web and flat bar cropped and part renewed or alternatively welded

Factors contributing to damage:

1. Asymmetrical connection of flat bar stiffener resulting in high peak stresses at the heel of the stiffener under fatigue loading.
2. Insufficient area of connection of longitudinal to web plate.
3. Defective weld at return around the plate thickness.
4. High localized corrosion at areas of stress concentration such as flat bar stiffener connections, corners of cut-out for the longitudinal and connection of web to shell at cut-outs.
5. High stress in the web of the transverse.
6. Dynamic sea way load/ship motions.

Figure 1.3.2.1(1) Typical Damage and Repair Example (Tanker) (Reproduced From Ref.2)

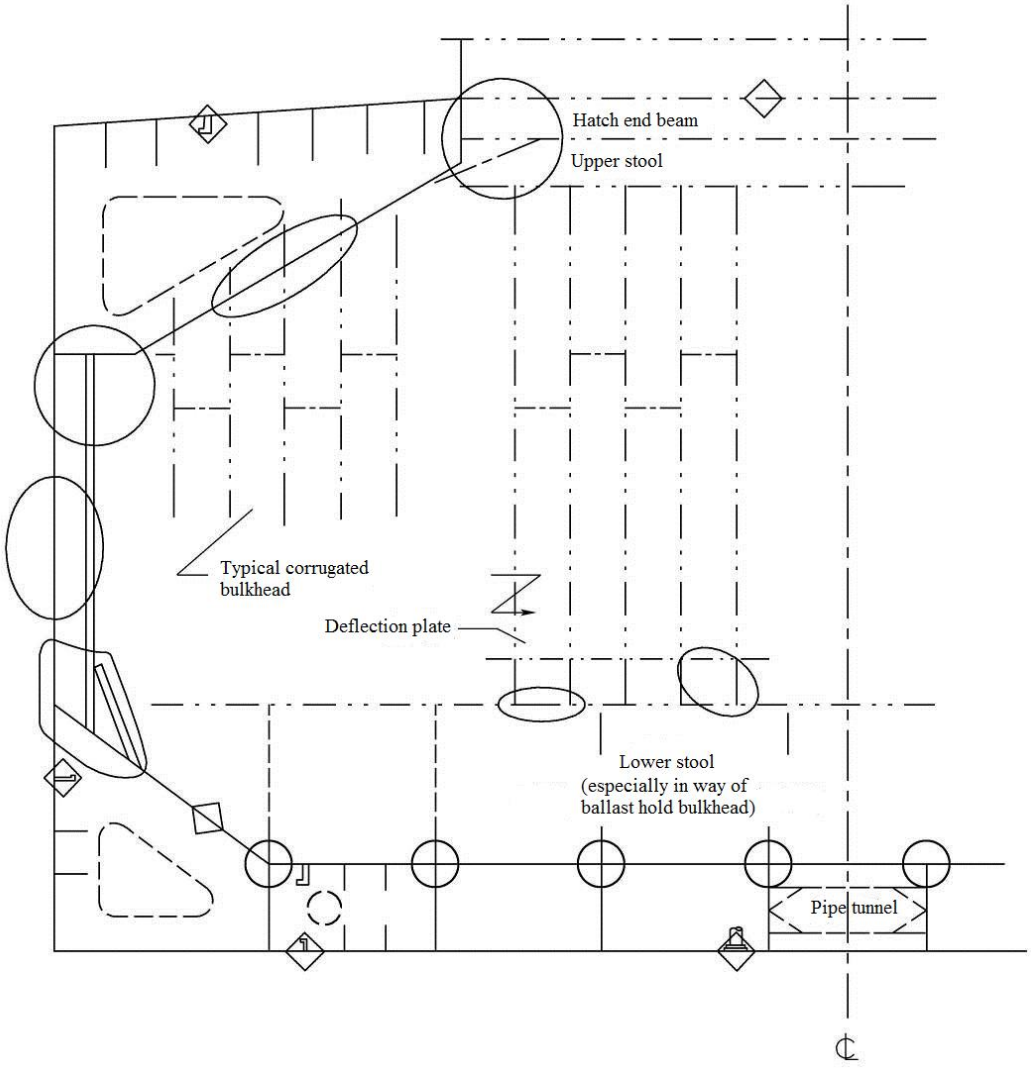


Figure 1.3.2.1(2) Typical Locations Susceptible to Structural Damage or Corrosion (Bulk Carrier)

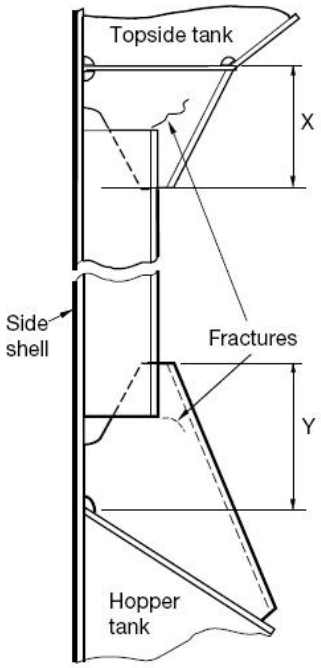
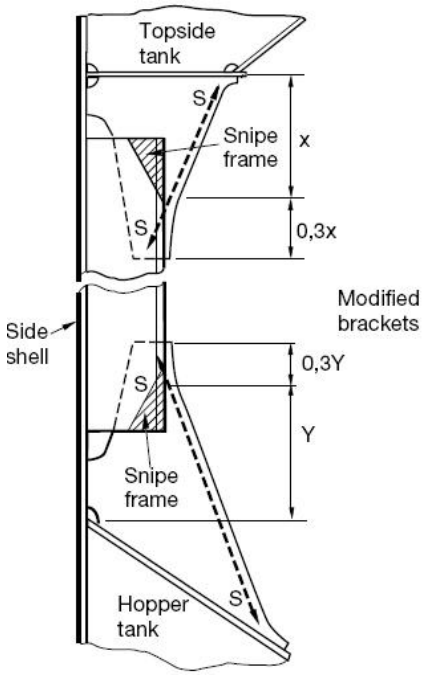
<table>
<tr><td>Area 1</td><td>Structural item</td><td>Side shell frames and end brackets (separate bracket configuration)</td><td>Example 1</td></tr>
<tr><td colspan="2">Detail of damage</td><td colspan="2">Fractures in brackets at termination of frame</td></tr>
<tr><td colspan="2">Sketch of damage
 


Separate bracket configuration</td><td colspan="2">Sketch of repair
 


S = Sniped end</td></tr>
<tr><td colspan="2">Notes on possible cause of damage:
This type of damage is due to stress concentration.</td><td colspan="2">Notes on repairs:
1. For small fractures e.g. hairline fractures, the fracture can be ‘veed’ out, welded up, ground and examined by NDT for fractures.
2. For large/significant fractures, consideration is to be given to cropping and partly renewing/renewing the frame brackets. If renewing the brackets, end of frames can be sniped to soften them.
3. If felt prudent, soft toes are to be incorporated at the boundaries of the bracket to the wing tanks.
4. Attention to be given to the structure in wing tanks in way of the extended bracket arm, i.e. reinforcement provided in line with the bracket arm</td></tr>
</table>

Note: The above Refs.2 and 3 are both from Tanker Structure Cooperative Forum (TSCF), and Ref.4 from Bulk Carriers-Guidelines for Surveys, Assessment and Repair of Hull Structure (IACS).

Appendix 13 RECOMMENDED PROCEDURES FOR THICKNESS MEASUREMENTS①

13.1A RECOMMENDED PROCEDURES FOR THICKNESS MEASUREMENTS OF SHIPS

1 Notes

1.1 This document is to be used for recording thickness measurements for all ships as required by Section 4, Chapter 5 of this PART.

1.2 Reporting forms TM1-G, TM2-G (i) and (ii), TM3-G, TM4-G, TM5-G (sheets 4 to 9) are to be used for recording thickness measurements and the maximum allowable diminution is to be stated. The maximum allowable diminution is to be stated in an attached document.

GENERAL PARTICULARS

Ship's name:

Notes:

1. This report is to be used for recording the thickness measurement of:
   A – All strength deck plating within the cargo length area.
   B – All keel, bottom shell plating and bilge plating within the cargo length area.
   C – Side shell plating that is all wind and water strakes within the cargo length area.
   D – Side shell plating that is selected wind and water strakes outside the cargo length area.
2. The strake position is to be clearly indicated as follows:
   2.1 For strength deck indicate the number of the strake of plating inboard from the stringer plate.
   2.2 For bottom plating indicate the number of the strake of plating outboard from the keel plate.
   2.3 For side shell plating give number of the strake of plating below sheer strake and letter as shown on shell expansion.
3. Only the deck plating strakes outside line of openings are to be recorded.
4. Measurements are to be taken at the forward and aft areas of all plates, and the single measurements recorded are to represent the average of multiple measurements.
5. The maximum allowable diminution could be stated in an attached document.

Notes:

1. This report is to be used for recording the thickness measurement of:
   Longitudinal members at transverse sections:
   Two or three sections within the cargo length area, comprising of the appropriate structural items.
2. The exact frame station of measurement is to be stated.
3. The single measurements recorded are to represent the average of multiple measurements.
4. The maximum allowable diminution could be stated in an attached document.

13.1B RECOMMENDED PROCEDURES FOR THICKNESS MEASUREMENTS OF SHIPS BUILT ACCORDING TO THE NET SCANTLING APPROACH①

Notes:
1. This document is to be used for recording thickness measurements of ships built according to the net scantling approach as required by Section 4, Chapter 5 of this PART.
2. Reporting forms TM1-G(NSD), TM2-G(NSD) (i) and (ii), TM3-G(NSD), TM4-G(NSD), TM5-G(NSD) (sheets 4 to 9) are to be used for recording thickness measurements. The as-built thickness, the voluntary thickness addition and renewal thickness (minimum allowable thickness) are to be stated in the said forms.

Notes:

1. This report is to be used for recording the thickness measurement of:
   A − All strength deck plating within the cargo length area.
   B − All keel, bottom shell plating and bilge plating within the cargo length area.
   C − Side shell plating that is all wind and water strakes within the cargo length area.
   D − Side shell plating that is selected wind and water strakes outside the cargo length area.
2. The strake position is to be clearly indicated as follows:
   2.1 For strength deck indicate the number of the strake of plating inboard from the stringer plate.
   2.2 For bottom plating indicate the number of the strake of plating outboard from the keel plate.
   2.3 For side shell plating give number of the strake of plating sheer strake and letter as shown on shell expansion.
3. Only the deck plating strakes outside line of openings are to be recorded.
4. Measurements are to be taken at the forward and aft areas of all plates and the single measurements recorded are to represent the average of multiple measurements.
5. The remaining corrosion addition is to be recorded with result of gauged thickness minus renewal thickness. If the result is negative, the structure in way is to be renewed, and the mark "*R*" is to be indicated in the right-hand column. If the result is between 0 and substantial corrosion allowable limits, the structure in way is to be additionally gauged, and the mark "*S*" is to be indicated in the right-hand column.

13.1 Recommended Procedures for Thickness Measurements of Oil Tankers, Ore/Oil Ships, etc.①

1. Notes

1.1 This document is to be used for recording thickness measurements for oil tanks as required by Section 6, Chapter 5 of this PART.

1.2 Sheets TM1-T, TM2-T, TM3-T, TM4-T, TM5-T and TM6-T (sheets 4 to 10) are to be used for recording thickness measurements and the maximum allowable diminution is to be stated.
The maximum allowable diminution could be stated in an attached document.

1.3 The remaining sheets 11 to 15 are guidance diagrams and notes relating to the reporting format and the procedure for the thickness measurements.

Thickness Measurement - Oil Tankers, Ore/Oil Ships and etc.

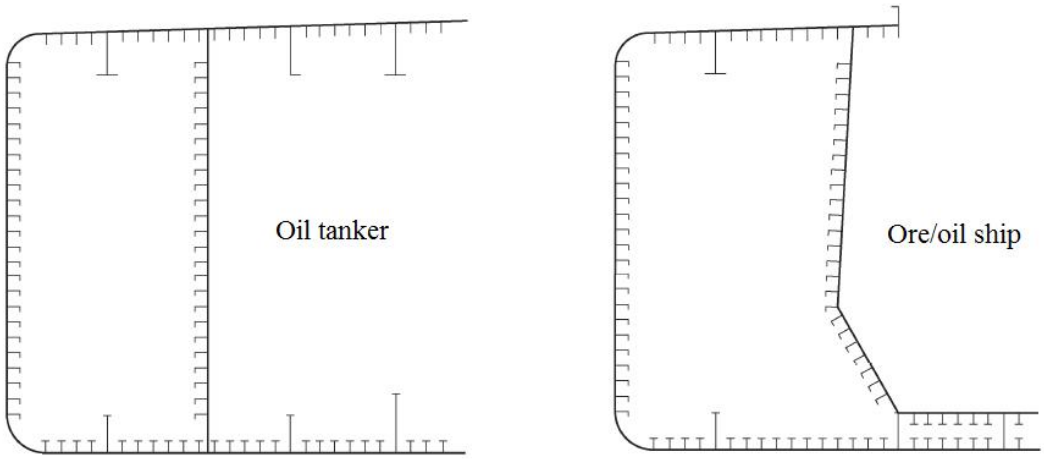
Typical Transverse Section Showing All Longitudinal Members to be Reported on TM2-T and TM3-T

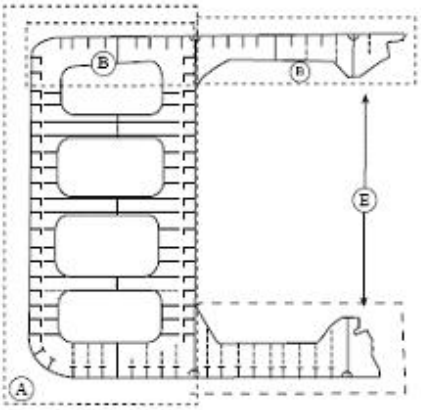


Sheet 15

Thickness Measurement - Oil Tankers, Ore/Oil Ships and etc.

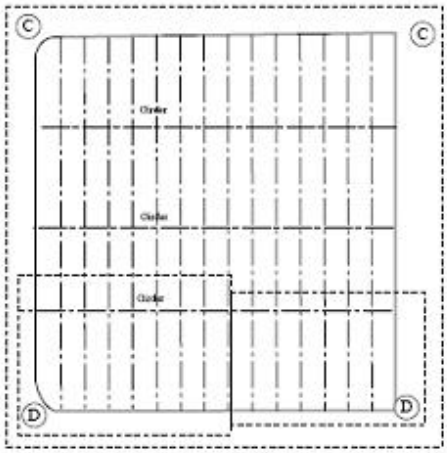
Close-up Survey Requirements

Oil Tanker
Typical transverse section close-up survey



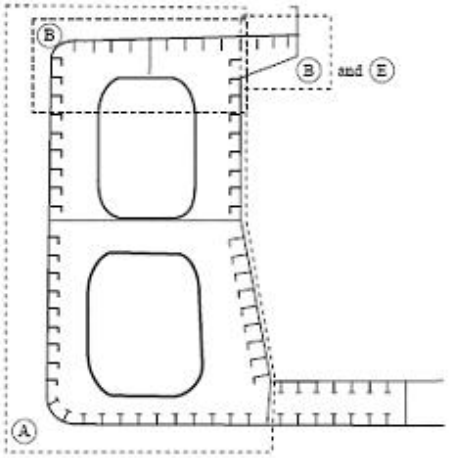
Thickness to be reported on
TM3-T and TM4-T as appropriate

Oil Tanker
Typical transverse bulkhead



Thickness to be reported on TM5-T

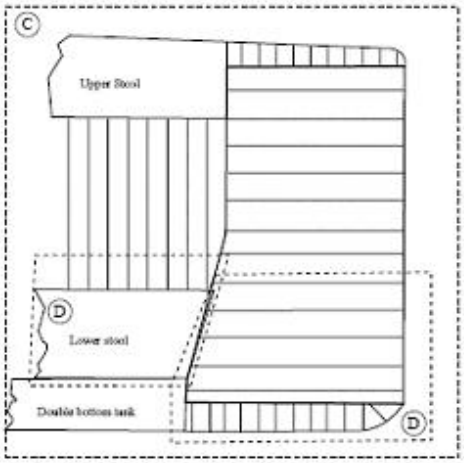
Oil/Ore ship
Typical transverse section close-up survey



Thickness to be reported on
TM3-T and TM4-T as appropriate

Close-up survey area

Oil/Ore ship
Typical transverse bulkhead



Thickness to be reported on TM5-T

13.2A Recommended Procedures for Thickness Measurements of Bulk Carriers

Notes:
1. This document is to be used for recording thickness measurements of single side skin bulk carriers as required by Section 7, Chapter 5 of this PART.

2. Reporting forms TM1-BC, TM2-BC, TM3-BC, TM4-BC, TM5-BC, TM6-BC and TM7-BC (Sheets 4 to 11) are to be used for recording thickness measurements and the minimum allowable diminution is to be stated.
The minimum allowable diminution could be stated in an attached document.

3. The remaining Sheets 12 to 14 are guidance diagrams and notes relating to the reporting forms and the IACS Unified Requirements for thickness measurement.

4. The reporting forms are where appropriate, to be supplemented by data presented on structural sketches.

Notes:

1. This report is to be used for recording the thickness measurement of:
   A – All strength deck plating within cargo length area.
   B – Keel, bottom shell plating and bilge plating within the cargo length area.
   C – Side shell plating that is selected wind and water strakes within the cargo length area.
   D – Side shell plating that is all wind and water strakes outside the cargo length area.
2. The strake position is to be clearly indicated as follows:
   2.1 For strength deck indicate the number of the strake of plating inboard from the stringer plate.
   2.2 For bottom plating indicate the number of the strake of plating outboard from the keel plate.
   2.3 For side shell plating give number of the strake of plating sheer strake and letter as shown on shell expansion.
3. Only the deck plating strakes outside line of openings are to be recorded.
4. Measurements are to be taken at the forward and aft areas of all plates and the single measurements recorded are to represent the average of multiple measurements.
5. The maximum allowable diminution could be stated in an attached document.

13.2B Recommended Procedures for Thickness Measurements of Bulk Carriers Built under Common Structural Rules①

Notes:

1. This document is to be used for recording thickness measurements of bulk carriers built under Common Structural Rules① as required by 5.1.9.3, Section 1, Chapter 5 of this PART.

2. Reporting forms TM1-BC(CSR), TM2-BC(CSR) (i) and (ii), TM3-BC(CSR), TM4-BC(CSR), TM5-BC(CSR), TM6-BC(CSR) and TM7-BC(CSR) (Sheets 4 to 11) are to be used for recording thickness measurements. The as-built thickness, the voluntary thickness addition and the renewal thickness (minimum allowable thickness) are to be stated in the said forms.

3. The remaining Sheets 12 to 14 are guidance diagrams and notes relating to the reporting forms and the procedure for the thickness measurement.

STRUCTURAL COMPONENT (PLATING/STIFFENER)	As Built Thickness mm	Voluntary Thickness Addition mm	Renewal Thickness mm (a)	Gauged Thickness mm (b)		Remaining Corr. Addition mm (b)-(a)			
				P	S	P		S	

Operators signature: ……

Notes:

1. This report is to be used for recording the thickness measurement of cargo hold transverse bulkheads.
2. Guidance for areas of measurement is indicated on the diagrams shown on Sheet 14 of this document.
3. The single measurements recorded are to represent the average of multiple measurements.
4. The remaining corrosion addition is to be recorded with result of gauged thickness minus renewal thickness. If the result is negative, the structure in way is to be renewed, and the mark "*R*" is to be indicated in the right-hand column. If the result is between 0 and 0.5 mm (0 included), the structure in way is to be additionally gauged, and the mark "*S*" is to be indicated in the right-hand column.

Notes:

1. This report is to be used for recording the thickness measurement of:
   Cargo hold transverse frames,
   Structural item number (34) as shown on the diagram of typical transverse sections.
2. Guidance for areas of measurement is indicated on the diagrams shown on Sheet 14 of this document.
   The single measurements recorded are to represent the average of multiple measurements.
3 The location and pattern of measurements is to be indicated on the sketches of hold frames shown below.
4. The remaining corrosion addition is to be recorded with result of gauged thickness minus renewal thickness. If the result is negative, the structure in way is to be renewed, and the mark "*R*" is to be indicated in the right-hand column. If the result is between 0 and 0.5 mm (0 included), the structure in way is to be additionally gauged, and the mark "*S*" is to be indicated in the right-hand column.

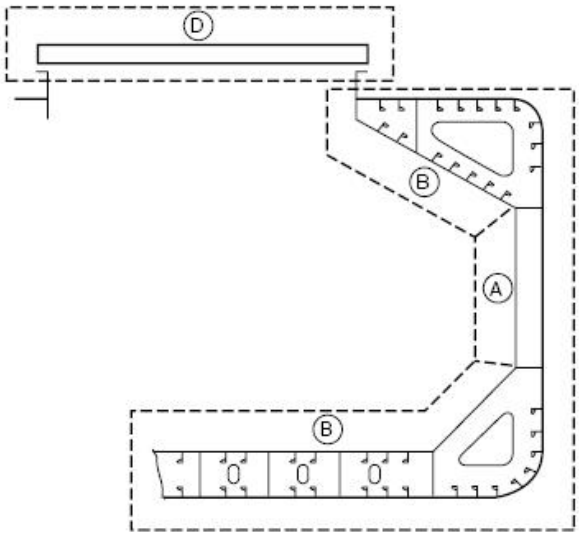
Close-up Survey and Thickness Measurement Areas

Typical transverse section

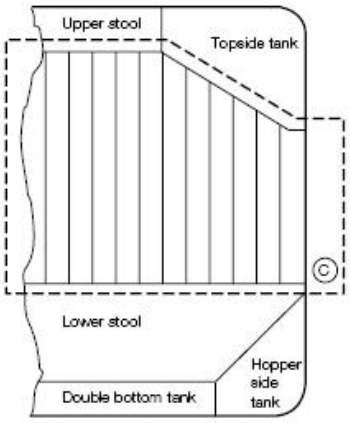
Areas (A), (B) and (D)



Thickness to be reportedd on TM3-BC, TM4-BC, TM6-BC and TM7-BC as appropriate

A cargo hold, transverse bulkhead

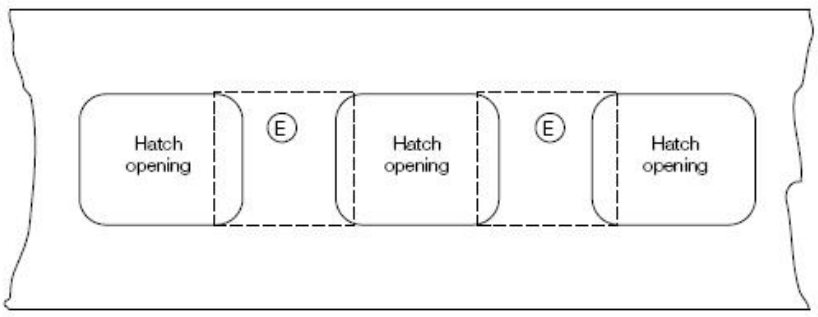
Area (C)



Thickness to be reported on TM5-BC

Typical areas of deck plating inside line of hatch openings between cargo hold hatches

Area (E)



Thickness to be reported on TM6-BC

13.3A Recommended Procedures for Thickness Measurements of Double Hull Oil Tankers

1. This document is to be used for recording thickness measurements as required by Section 6, Chapter 5 of this PART.
2. Reporting forms TM1-DHT, TM2-DHT, TM3-DHT, TM4-DHT, TM5-DHT and TM6-DHT (Sheets 4 to 10) are to be used for recording thickness measurements and the maximum allowable diminution is to be stated.
The maximum allowable diminution could be stated in an attached document.
3. The remaining Sheets 11 to 15 are guidance diagrams and notes relating to the reporting forma and the procedure for the thickness measurements.

13.3B Recommended Procedures for Thickness Measurements of Double Hull Oil Tankers Built under Common Structural Rules①

Notes:
1. This document is to be used for recording thickness measurements of double hull oil tankers built under Common Structural Rules① as required by 5.1.9.3, Section 1, Chapter 5 of this PART.

2. Reporting forms TM1-DHT(CSR), TM2-DHT(CSR)(i) and (ii), TM3-DHT(CSR), TM4-DHT(CSR), TM5-DHT(CSR) and TM6-DHT(CSR) (Sheets 4 to 10) are to be used for recording thickness measurements. The as-built thickness, the voluntary thickness addition and the renewal thickness (minimum allowable thickness) are to be stated in the said forms.

3. The remaining Sheets 11 to 15 are guidance diagrams and notes relating to the reporting forms and the procedure for the thickness measurement.

Notes:

1. This report is to be used for recording the thickness measurement of:
   Shell plating transverse sections:
   One, two or three sections within the cargo length area, comprising the structural items (3), (4), (5) and (6) as shown on the diagram of typical transverse sections, illustrated on Sheets 11 and 12 of this document.
2. The bottom area comprises keel, bottom and bilge plating.
3. The exact frame station of measurement is to be stated.
4. The single measurements recorded are to represent the average of multiple measurements.
5. The remaining corrosion addition is to be recorded with result of gauged thickness minus renewal thickness. If the result is negative, the structure in way is to be renewed, and the mark "*R*" is to be indicated in the right-hand column. If the result is between 0 and 0.5 mm (0 included), the structure in way is to be additionally gauged, and the mark "*S*" is to be indicated in the right-hand column.

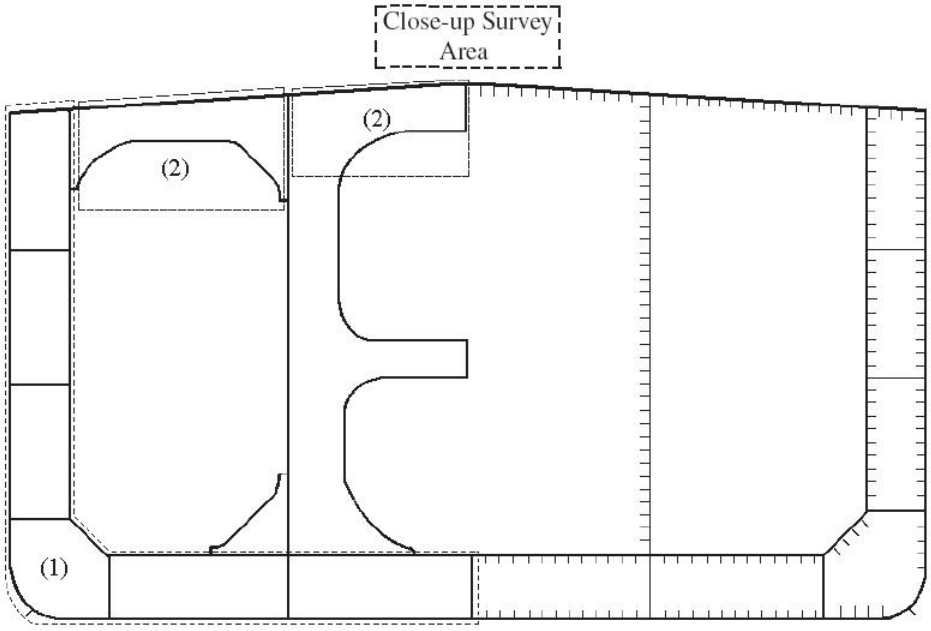
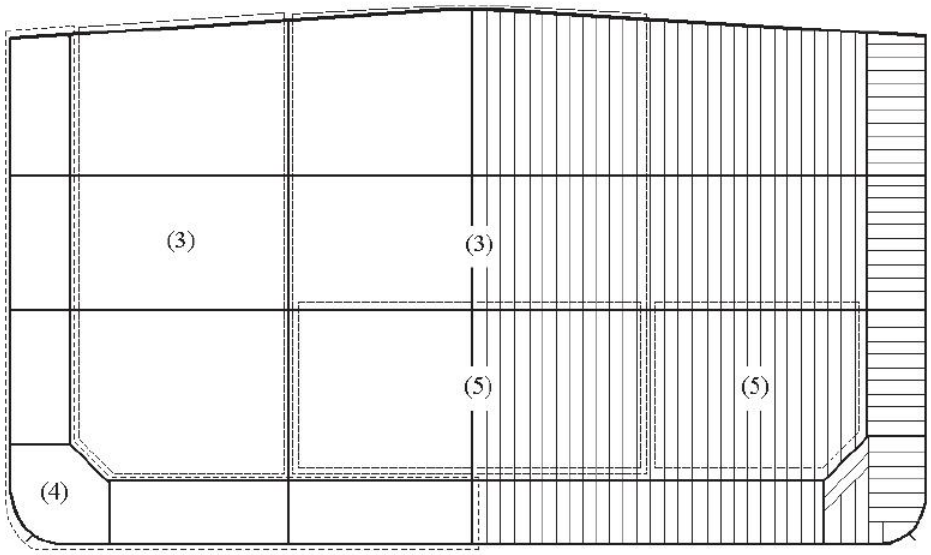
Sheet 14

Close-up Survey and Thickness Measurement Areas

Areas subject to close-up survey and thickness measurements – areas (1) to (5) as defined in Table 5.6.4.3(2)② of Section 6, Chapter 5 of this PART – Thickness to be reported on TM3-DHT(CSR), TM4-DHT(CSR) and TM5-DHT(CSR) as appropriate.

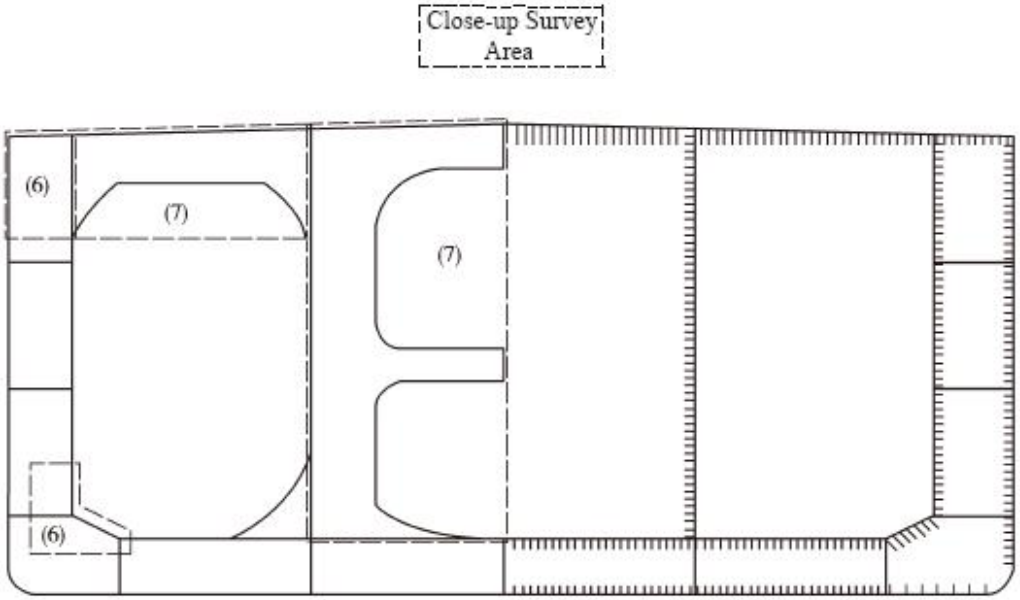




Sheet 15

Close-up Survey and Thickness Measurement Areas

Areas subject to close-up survey and thickness measurements – areas (6) to (7) as defined in Table 5.6.4.3(2)② of Section 6, Chapter 5 of this PART – Thickness to be reported on TM3-DHT(CSR) and TM4-DHT(CSR) as appropriate.



13.4A Recommended Procedures for Thickness Measurements of Double Skin Bulk Carriers

Notes:
1. This document is to be used for recording thickness measurements as required by Section 7, Chapter 5 of this Part.

2. Reporting forms TM1-DSBC, TM2-DSBC, TM3-DSBC, TM4-DSBC, TM5-DSBC and TM6-DSBC (Sheets 4 to 10) are to be used for recording thickness measurements and the maximum allowable diminution should be stated.
The maximum allowable diminution could be stated in an attached document.

3. The remaining Sheets 11 to 14 are guidance diagrams and notes relating to the reporting forms and the procedure for the thickness measurements as required by IACS Unified Requirement.

Notes:

1. This report is to be used for recording the thickness measurement of:
   1.1 All strength deck plating within cargo length area.
   1.2 All keel, bottom shell plating and bilge plating within the cargo length area.
   1.3 Side shell plating including selected wind and water strakes outside cargo length area.
   1.4 All wind and water strakes within cargo length area.
2. The strake position is to be clearly indicated as follows:
   2.1 For strength deck indicate the number of the strake of plating inboard from the stringer plate.
   2.2 For bottom plating indicate the number of the strake of plating outboard from the keel plate.
   2.3 For side shell plating give number of the strake of plating sheer strake and letter as shown on shell expansion.
3. Only the deck plating strakes outside line of openings are to be recorded.
4. Measurements are to be taken at the forward and aft areas of all plates and where plates cross ballast/cargo tank boundaries separate measurements for the area of plating in way of each type of tank are to be recorded.
5. The single measurements recorded are to represent the average of multiple measurements.
6. The maximum allowable diminution could be stated in an attached document.

Thickness to be reported on TM5-DSBC

13.4B Recommended Procedures for Thickness Measurements of Double Skin Bulk Carriers Built under Common Structural Rules①

Notes:
1. This document is to be used for recording thickness measurements of double skin bulk carriers built under Common Structural Rules① as required by 5.1.9.3, Section 1, Chapter 5 of this PART.

2. Reporting forms TM1-DSBC(CSR), TM2-DSBC(CSR) (i) and (ii), TM3-DSBC(CSR), TM4-DSBC(CSR), TM5-DSBC(CSR) and TM6-DSBC(CSR) (Sheets 4 to 10) are to be used for recording thickness measurements. The as-built thickness, the voluntary thickness addition and the renewal thickness (minimum allowable thickness) are to be stated in the said forms.

3. The remaining Sheets 11 to 13 are guidance diagrams and notes relating to the reporting forms and the procedure for the thickness measurement.

Notes:

1. This report is to be used for recording the thickness measurement of:
   1.1 All strength deck plating within the cargo length area.
   1.2 All keel, bottom shell plating and bilge plating within the cargo length area.
   1.3 Side shell plating including selected wind and water strakes outside the cargo length area.
   1.4 All wind and water strakes within the cargo length area.
2. The strake position is to be clearly indicated as follows:
   2.1 For strength deck indicate the number of the strake of plating inboard from the stringer plate.
   2.2 For bottom plating indicate the number of the strake of plating outboard from the keel plate.
   2.3 For side shell plating give number of the strake of plating sheer strake and letter as shown on shell expansion.
3. Only the deck plating strakes outside the line of openings are to be recorded.
4. Measurements are to be taken at the forward and aft areas of all plates and the single measurements recorded are to represent the average of multiple measurements.
5. The remaining corrosion addition is to be recorded with result of gauged thickness minus renewal thickness. If the result is negative, the structure in way is to be renewed, and the mark "*R*" is to be indicated in the right-hand column. If the result is between 0 and 0.5 mm (0 included), the structure in way is to be additionally gauged, and the mark "*S*" is to be indicated in the right-hand column.

Thickness to be reported on TM6-DSBC(CSR)

Appendix 14 GUIDELINES FOR SCREWSHAFT CONDITION MONITORING SYSTEM

1 General Provisions

1.1 General requirements

1.1.1 Scope

1.1.1.1 These Guidelines apply to the ships applying for the class notation SCM.

1.1.1.2 These Guidelines apply also to rudder propellers (or called azimuth propulsion arrangements).

1.1.2 Application

1.1.2.1 Where the screwshaft condition monitoring (SCM) system is intended for a ship, the owner is to submit an application together with the following information to CCS for approval:

(1) Feasibility of condition monitoring (including approved shaft glands fitted and capable of being replaced without drawing the screwshaft, etc.);

(2) General arrangement of screwshaft and stern tube, including oil glands, shaft structure and fitting of shaft with propeller (if already provided, this may not be submitted).

1.1.2.2 One copy of the above-mentioned documentation is to be retained on board the ship.

1.1.3 Requirements for the analysis organization and its personnel

1.1.3.1 A lubricating oil analysis organization seeking the approval by CCS for carrying out the corresponding analysis work, is to make an application to CCS for certification of the organization and its personnel in accordance with the relevant requirements of Section 4 of these Guidelines.

1.1.3.2 Where an analysis organization and its personnel, of which the expenses are borne by the owner or shipyard, are not subject to the approval by CCS, the relevant requirements of Section 4 of these Guidelines are to be complied with.

1.1.3.3 A lubricating water analysis organization carrying out water-lubricated screwshaft condition monitoring system is to comply with International Standards for Laboratory Approval (e.g. ISO/IEC 17025) or equivalent standards accepted by CCS. The analysis organization is to submit qualification certificate to the ship owner.

1.2 Oil-lubricated screwshaft condition monitoring system

1.2.1 Role of condition monitoring system

1.2.1.1 The screwshaft condition monitoring system is to analyze various tests of the lubricating oil in use for the screwshaft so as to indicate the wear condition of bearings, determine the deterioration of lubricating oil and provide the basis for maintenance decision. Therefore, after the class notation SCM is assigned, the main engines are still to be operated within the required speed ranges to prevent shafting from being operated within the restricted speed ranges or speed ranges where vibration stress is great.

1.2.1.2 Within the interval between surveys, the screwshaft condition monitoring system may be used to replace drawing of screwshaft.

1.2.1.3 The condition monitoring system has the following characteristics:

(1) to save the maintenance expenses;

(2) to reduce the ship’s laid-up period;

(3) to avoid damaging the equipment twice;

(4) to increase the equipment usage and extend the service life of lubricating oil.

1.2.2 Technical methods used by condition monitoring system

1.2.2.1 The condition monitoring system uses three methods, i.e. physical and chemical analysis, atomic spectrum analysis and ferrographic analysis which have different characteristics respectively and complement each other.

1.2.3 The physical and chemical analysis is capable of:

1.2.3.1 measuring and assessing the change of quality of lubricating oil, e.g. chloride content in lubricating oil, oxidation and sulphidation of lubricating oil and deterioration of additives;

1.2.3.2 detecting the contaminants in lubricating oil, e.g. dust, diluted fuel and water;

1.2.3.3 detecting the change of physical performance of lubricating oil, e.g. viscosity, total acid number and total base number;

1.2.3.4 assessing the lubricating oil condition to indicate proper intervals for replacing oil and extend the service life of lubricating oil so far as practicable with the machinery friction pairs being well lubricated.

1.2.4 The atomic spectrum analysis is capable of:

1.2.4.1 judging the wear condition of machinery friction pairs and of lubricating oil by detecting the kinds,

concentration and variation trend of metallic and non-metallic elements in the lubricating oil.
1.2.5 The ferrographic analysis is capable of:
1.2.5.1 by analyzing the appearance (shape, surface texture, edges, colors, etc.) and concentration of the wear particles in the lubricating oil, further judging the wear condition of machinery friction pairs and determining the mechanism and positions of wear so as to provide the basis for early failure forecasts and maintenance decisions.

1.3 Water-lubricated screwshaft condition monitoring system

1.3.1 Role of condition monitoring system
1.3.1.1 Water-lubricated screwshaft condition monitoring system monitors quality, flow rate and temperature of screwshaft lubricating water as well as wear or protection condition of screwshaft and shaft liner so as to ensure indication of the wear condition of bearings and corrosion condition of shafts, determine quality condition of lubricating water and provide the basis for maintenance decision.
1.3.1.2 Within the interval between surveys, the screwshaft condition monitoring system may be used to replace drawing of screwshaft.
1.3.2 Technical requirements for condition monitoring system
1.3.2.1 The screwshaft is to either be made of corrosion resistant material or protected with a corrosion resistant protective liner or coating approved by CCS (i.e. shaft body is covered by paint between two bearing liners to prevent water corrosion). Where a protective liner and/or coating is used, the ship owner must submit measures for condition examination and evaluation (e.g. at stern tube opening or fitted with endoscope), which are to be approved by CCS.
1.3.2.2 Shaft glands are to be capable of being replaced without withdrawal of the screwshaft.
1.3.2.3 A maximum permitted weardown of the bearing and the weardown at which it is recommended to carry out an inspection and maintenance are to be established, and equipment measuring bearing clearance is to be fitted. When the ship is docking or subject to in-water survey, bearing weardown or clearance is to be measured and the conditions of wear of protective shaft liner and integrity of coating are to be examined. The results are to be recorded and retained on board.
1.3.2.4 For open water lubrication system, the ship is to be fitted with water supply processing system. The lubricating water supply is to be filtered, separated and purified, so as to ensure compliance with design requirements of the manufacturer. The water supply pump, filters and separators are to be duplicated and as a standby to each other, match the lubrication water flow required by the design and have sufficient redundancy to ensure that the lubrication water flow requirements can be met even when filters and separators are slightly clogged. The above equipment is to be easy for maintenance and replacement, and means are to be provided to prevent impurities such as suspended particles from entering the lubrication water of the stern tube during maintenance. The system is to be provided with sampling openings which are readily accessible, and the selected samples are to reflect the condition of processed water supply before entering stern tube. Samples are to be taken under service condition.
1.3.2.5 The ship owner is to establish sampling procedure, appoint special person to collect water supply samples regularly at intervals not exceeding six months. The analysis organization mentioned in 1.1.3.3 is to carry out water sample detection and analysis according to detection technology and water sample analysis index allowance provided by the manufacturer, and analysis records are to be kept on board ship. For open water lubrication system, sampling is to be carried out at least once every 6 months, and the size of suspending particles are to be detected each time as a minimum. In the absence of procedures for sampling or records for sampling and testing, equivalent means including but not limited to the followings may be taken:

① during the annual survey and tube shaft survey as a minimum, the supply water treatment system is to be inspected, the maintenance record and alarm record are to be checked, and the monitoring and alarm equipment is to be confirmedin a satisfactory working condition; or
② online monitoring of the diameter of the floating particles in the supply water, and providing the alarm function when standard is exceeded.

For closed water lubrication system, sampling is to be carried out at least once every 6 months, and chloride content, PH value as well as bearing material particles content are to be detected each time as a minimum.[①]
1.3.2.6 Two independent sensors are to be provided to monitor flow rate of water supply, one of which is to be near inlet of screwshaft lubricating water as far as possible. When the shaft is started and the flow rate of lubricating water is below specified value, audible and visual alarm is to be given, and engine room

① Refer to IACS Rec 143 Recommended procedure for the determination of contents of metals and other contaminants in a closed fresh water system lubricated stern tube.

monitoring and alarm system is to record such alarm.
1.3.2.7 Screwshaft interlock is to be provided to prevent starting screwshaft when normal flow rate of lubricating water is not established.
1.3.2.8 For closed water lubrication system, the ship owner is to adopt fresh water as circulating lubrication medium. Circulating water temperature sensor is to be provided at circulating water outlet of stern tube. When water temperature exceeds specified value recommended by the manufacturer, audible and visual alarm is to be given by temperature sensor, and engine room monitoring and alarm system is to record such alarm. The ship is to record daily consumption of circulating water.

2 Surveys

2.1 Initial survey

2.1.1 Examination of plans and documentation
2.1.1.1 For a ship with oil-lubricated screwshaft, when applying for SCM notation, the plans and documents listed in 1.1.2.1 are to be submitted for examination and approval, compliance of all systems with the requirements of these Guidelines is to be confirmed, and the following conditions are to be satisfied:
(1) the oil lubricating system of the propeller shaft is to be fitted with a device for taking samples representative of the oil in the system;
(2) the tube shaft is to be fitted with at least 2 sensors or other approved devices for measuring bearing temperature;
(3) the propeller shaft is to be fitted with a device for measuring bearing wastage;
(4) oil glands are capable of being replaced without withdrawal of the propeller shaft;
(5) the oil lubricating system of the propeller shaft is to be fitted with a device for indicating oil consumption.
2.1.1.2 For a ship with water-lubricated screwshaft, when applying for SCM notation, the plans and documents listed in 1.1.2.1 are to be submitted for examination and approval, and compliance of all systems with relevant technical requirements in 1.3.2 of the Guidelines is to be confirmed.
2.1.1.3 Initial survey for new construction
(1) All systems required by these Guidelines are to be examined and tested to confirm compliance with the approved plans and documentation.
(2) Verification that management documents related to condition monitoring, as required by these Guidelines, are provided on board.
2.1.1.4 Initial survey for existing ships
(1) All systems required by these Guidelines are to be examined and tested to confirm compliance with the approved plans and documentation.
(2) If the specified survey (drawing of the shaft) is due, the survey is to be carried out in conjunction with the initial survey in accordance with the rules; or
(3) At least the following records of screwshaft condition monitoring (SCM) showing satisfactory results in the last 3 years are to be submitted:

① stern bearing oil analysis records or lubricating water analysis records and qualification certificate of analysis organization;
② stern bearing oil consumption records or closed circulating lubricating water consumption records;
③ stern bearing temperature monitoring records (oil-lubricated screwshaft);
④ stern bearing clearance and tailshaft weardown measurement records;
⑤ alarm records (water-lubricated screwshaft).

2.2 Annual survey

2.2.1 The requirements for annual surveys are given in Section 12, Chapter 5 of this PART.

2.3 Miscellaneous

2.3.1 Availability of lubricating oil or lubricating water analysis information
2.3.1.1 The lubricating oil or lubricating water analysis information is to be kept on board the ship by the chief engineer for check by the attending Surveyor.
2.3.2 Cancellation of the class notation SCM
2.3.2.1 At the request of the owner or where the annual survey specified in 5.12.4, Section 12, Chapter 5 of this PART is not carried out on time, the SCM notation may be canceled and survey is to be carried out in accordance with relevant provisions of Section 12, Chapter 5 of this PART.

3 Oil-lubricated Screwshaft Condition Monitoring Procedures

3.1 Sampling procedure

3.1.1 Sampling personnel

3.1.1.1 All oil samples are to be taken by a designated person on board or the chief engineer, who is to fill in a sampling table and make an appropriate record which are to be kept on board for future examination. The sampling personnel are to be skilled at sampling.

3.1.2 Sampling period

3.1.2.1 For the screwshaft monitored by lubricating oil analysis, a sampling analysis of lubricating oil is to be carried out at least once every six months. Where the sampling frequency is increased by the owner, this is to be recorded for future examination.

3.1.2.2 Where the analysis can not be carried out on time when the sampling is due because the ship is in operation at sea, oil samples are still to be taken on time. However, the lubricating oil analysis is to be completed within three months.

3.1.2.3 According to lubricating oil analysis results and practical operation condition (e.g. replacing of lubricating oil or abrupt change of wear particle concentration), the Surveyor may require the sampling period to be reduced.

3.1.3 Sampling positions

3.1.3.1 For forced oil circulating lubrication systems, samples may be taken at the dump pump or the valve fitted in front of the filter and capable of sampling.

3.1.3.2 For gravity type lubrication systems, samples may be taken at oil outlet at the bottom of stern tube unit.

3.1.3.3 For permanent sampling valves and tubes fitted in the pipelines, oil of about twice the volume of residual oil is to be discharged prior to sampling to ensure that no oil sampled at the last time is left.

3.1.3.4 Where samples are taken at oil outlet, an amount of oil is to be discharged prior to sampling to wash away the sediments left there.

3.1.4 Sampling condition

3.1.4.1 Samples are to be taken in the normally stable operation condition of the screwshaft or immediately after stop of the operation.

3.1.4.2 Each time the samples are taken in the operation condition, the equipment is to be in the similar working conditions (e.g. rate of revolution, power).

3.1.5 Sampling precautions

3.1.5.1 Sampling tools (including sample bottles, samplers, tubes, etc.) are to be kept clean, non-fragile and protected from pollution.

3.1.5.2 Sample bottles are to be made of colorless and transparent plastic or glass.

3.1.5.3 The lubricating oil sample is to be taken for an amount of about 2/3 of the volume of a sample bottle, but not less than 150 ml.

3.2 Analysis of lubricating oil samples

3.2.1 General requirements

3.2.1.1 During the lubricating oil sample analysis, in general, the physical and chemical analysis and the spectrum analysis are to be carried out at first and then on this basis, the analysis by direct reading ferrogram may be carried out. Where it is considered necessary, qualitative analysis is to be carried out by an analytical ferrograph.

3.2.2 Items and methods of lubricating oil analysis for screwshaft

3.2.2.1 The lubricating oil analysis items:

Analysis items	Analysis means (or instruments)
Physical and chemical analysis	Physical and chemical analysis instruments (international standards)
Element content (mainly for metal) analysis	Spectrum analysis [atomic emission (or absorption) spectrograph]
Analysis of appearance and concentration of wear particles	Ferrographic analysis (ferrograph)

3.2.2.2 Physical and chemical analysis items (items marked with "*" are optional):

(1) viscosity;

(2) water;

(3) total acid number (TAN);

(4) total base number (TBN);

(5) content of insolubles;
(6) deterioration* (oxidation, nitrification, etc.);
(7) pollution* (contaminant pollution, etc.).

3.2.2.3 For the element content analysis, the content of the following elements is to be measured:

(1) elements relative to wear of metal (materials of shaft, bearings, gearing, etc.): chromium, lead, copper, nickel, iron, silicon, tin, molybdenum, etc.;
(2) elements relative to pollution: Magnesium, sodium, etc.;
(3) elements relative to additives: Barium, boron, calcium, magnesium, phosphor, zinc, lithium, etc.

The sources of various elements are to be correctly differentiated in accordance with the materials of friction pairs, additive components of lubricating oil, ambient working environment, etc.

3.2.2.4 Analysis of appearance and concentration wear particles:

(1) Where the appearance of wear particles is analyzed by analytical ferrograph, a classified description is to be made in accordance with the following types of wear particles:

a. rubbed wear particles;
b. cutting wear particles;
c. spherical wear particles;
d. fatigue wear particles in lumpy shape;
e. laminar wear particles;
f. severe sliding wear particles;
g. corroded wear particles;
h. red oxidic particles;
i. black oxidic particles;
j. non-metallic crystals;
k. pollutant particles.

(2) Where the quantitative analysis of concentration is carried out by direct-reading ferrograph, the reading values D_l (large particles) and D_S (small particles) are to be measured and recorded.

3.2.3 Determination of reference values for parameters of lubricating oil analysis

3.2.3.1 The allowable ranges of physical and chemical criteria required for the type of lubricating oil used by the owner are to be used in judging physical and chemical parameters of the lubricating oil.

3.2.3.2 The reference values for the quantitative spectrum or ferrographic analysis depend on values accumulated from practical tests and experience to a great extent. The reasonable criteria for judgment are to be determined by comparing the results of sampling tests of the specific monitored objects with the practical operation conditions. In the quantitative spectrum or ferrographic analysis, trend analysis is to be based mainly on the measured values.

3.2.3.3 In the quantitative spectrum or ferrographic analysis, the following interim criteria are to be used for reference:

Viscosity (at 40℃)	at least 70 m^2/s
Water	maximum 1%
Copper	maximum 50 ppm
Iron	maximum 30 ppm
Tin	maximum 10 ppm
Nickel	maximum 10 ppm
Chromium	maximum 10 ppm
Silicon	maximum 40 ppm
Sodium	maximum 80 ppm
Lead	maximum 10 ppm
Chlorine content in water	maximum 70ppm ((ingress of salt water)
Magnesium	maximum 30ppm

In addition, the gradient values of spectrum readings are to be controlled.

3.2.3.4 In the direct-reading ferrogram analysis, wear reference line and control line are to be made in accordance with direct reading values.

(1) It is recommended that the reference line be determined as follows.

The reference line (expressed as $\overline{WPC}$) is determined by wear particle concentration parameters (expressed as WPC) at normal wear stage:

$$\overline{WPC}=\frac{\sum_i^n (WPC_i)}{n}$$

where: i — sample number;
n — the total number of samples.

(2) It is recommended that the control line be determined as follows.
The control line is divided into warning line and dangerous line:

Warning line $= \overline{WPC} + 2S$

Dangerous line $= \overline{WPC} + 3S$

$$S = \sqrt{\frac{\sum WPC_i^2 - \frac{\left(\sum EPC_i\right)^2}{n}}{n-1}}$$

where: S — standard variance.

(3) When calculating the reference line and control line, it is impossible to include all *WPC* values in normal wear condition, and only a part of the latest *WPC* values are required to be taken into consideration, generally not less than five specimen values ($n \geq 5$).

3.2.3.5 Oil ageing

(1) Oxidation characteristics such as Total Acid Number (TAN), viscosity and oil appearance depend upon the type of oil used. Hence no recommended value is listed. Instead observation of any trends (such as viscosity and change in colour etc.) based on sequential analysis should be made. TAN is adversely influenced by oxidation for most typical oil lubricant types and also by hydrolysis in the case of unsaturated Environmentally Acceptable Lubricants (EALs). Observation of any trends on TAN should be made based on sequential analysis in conjunction with the limits defined by the oil maker for continued use in service.

3.2.4 All lubricating oil samples are to be sent to an analysis organization approved or accepted by CCS for analysis. The analysis organization is to complete the analysis in time, fill in the lubricating oil analysis record table carefully and correctly and submit an analysis report. Where the analysis results exceed the allowable ranges or any abnormality or uncertainty is found, the owner has the obligation to report this to CCS in time.

3.3 Condition monitoring record and analysis report

3.3.1 Measurement record by owner

3.3.1.1 The consumption of lubricating oil is to be measured once a month and recorded in the Lubricating Oil Consumption Record Table, refer to Table 3.3.1.1.

Lubricating Oil Consumption Record **Table 3.3.1.1**

Name of monitored ship: Type of lubricating oil:		Name of monitored objects:		
Measuring date	Volume of lub. oil (L)	Consumption of lub. oil (L)	Refilled volume of lub. oil (L)	Measuring personnel

3.3.1.2 The bearing temperature of screwshaft in normal operation condition is to be measured once a month and recorded in the Bearing Temperature Record Table, refer to Table 3.3.1.2.

Bearing Temperature Record **Table 3.3.1.2**

Name of monitored ship: Type of bearings:		Name of monitored objects:	
Measuring date	Bearing temperature	Service hours of bearing (h)	Measuring personnel

3.3.1.3 Each time samples are taken, sampling personnel are to fill in the Sampling Record Table accurately, refer to Table 3.3.2.1. A label showing name of the monitored ship and sampling date, etc. are to be affixed to the sample bottles. The completed Table together with the oil samples is to be sent to the analysis organization. Where the analysis organization is changed, the last analysis results are also to be sent to the new analysis organization.

3.3.2 Contents and formats of condition monitoring records and report

3.3.2.1 Sampling Record Table

The Sampling Record Table is to cover the basic parameters (static values) of the monitored objects and the working parameters (dynamic values) during sampling. The basic parameters include name of the monitored machinery, sampling position, measure units used, numbering, power, rate of revolution, type and volume of lubricating oil, etc. The working parameters include total operating hours of equipment, service time of lubricating oil, service hours of filter, bearing temperature, oil pressure, oil temperature, refilling of lubricating oil, operation site and sampling date, etc., refer to Table 3.3.2.1.

Sampling Record **Table 3.3.2.1**

Name of owner:	Name of monitored ship:
Name of monitored machinery:	Sampling method:
Sampling position:	Sampling date:
Sampling personnel:	Sample No.:
Bearing temperature:	Power of main engines:
Rate of revolution of screwshaft (r/min):	Service hours (h):
Type of lub. oil:	Volume of lub. oil (L):
Temperature of lub. oil:	Service hours of lub. oil (h):
Service hours of lub. oil filter (h):	Pressure of lub. oil (MPa):
Refilling quantity and period of lub. oil (L/frequency, h):

3.3.2.2 Lubricating Oil Analysis Record Table

The Lubricating Oil Analysis Record Table is divided into three kinds: Physical and Chemical Analysis Record Table (including test and analysis of viscosity, water content, content of insolubles, total acid number, total base number, pollution and deterioration of lubricating oil), Spectrum Analysis Record Table (including test and analysis of content of elements, e.g. metallic particles worn from machinery friction pairs into lubricating oil, metallic particles and pollutants in lubricating oil additive), Ferrographic Analysis Record Table (including information and conclusions obtained from ferrographic analysis of samples, preparation data of samples, quantitative data of ferrogram, types and quantities of wear particles, etc.), refer to Tables 3.3.2.2(1), 3.3.2.2(2) and 3.3.2.2(3) respectively. The owner may add necessary items in these tables according to their own needs.

3.3.2.3 Condition Monitoring Analysis Report

The Analysis Report is a report sheet, which is to be completed by a lubricating oil analysis organization approved or accepted by CCS and is to be provided to the owner for guidance of his operation and maintenance, covering basic condition of the monitored objects, main data of lubricating oil analysis, analysis results, recommendation, etc., refer to Table 3.3.2.3.

3.3.3 Preservation of lubricating oil analysis documentation

3.3.3.1 All records and analysis reports for lubricating oil condition monitoring are to be prepared in triplicate, one is to be retained by the analysis organization for reference, one submitted to CCS for filing and one kept on board the ship.

4 Requirements for Approval of Lubricating Oil Analysis Organizations and Their Personnel

4.1 General requirements

4.1.1 Scope

4.1.1.1 The requirements of this Section apply to the following three types of analysis organizations and their personnel:

(1) analysis organizations established by CCS and their personnel;

(2) analysis organizations and their personnel (subcontractors) applying for the approval by CCS;

(3) analysis organizations and their personnel who are not approved by CCS and whose expenses are borne by the owner.

4.1.2 General requirements

4.1.2.1 This Section has been prepared in accordance with the requirements of IACS QSCS.

4.1.2.2 The analysis organizations and their personnel applying for the approval by CCS are to pay the relative expenses in accordance with the provisions of CCS.

4.1.2.3 The instruments and equipment of an analysis organization may be purchased at its discretion or leased from other organizations.

4.1.2.4 It is recommended that the owner designate an analysis organization as a permanent partner.

4.2 Requirements for approved analysis organizations and their personnel

4.2.1 Requirements for approval of analysis organizations

4.2.1.1 The analysis organization is to have a complete set of quality assurance system for lubricating oil analysis condition monitoring, including work post responsibility, analysis result and report review, files management, instrumentation management and calibration, personnel training and assessment, etc.

4.2.1.2 The analysis organization is to be provided with at least three approved lubricating oil analysts (at least one for physical and chemical analysis, one for spectrum analysis and one for ferrographic analysis). The chief analyst is to be an engineer or have a more superior technical rank, familiar with the analysis technique, skilled at proper operation of instrumentation, and capable of working independently, giving guidance to other analysts and making a correct evaluation of the analysis results.

4.2.1.3 The analysis organization is to be provided with appropriate instrumentation and equipment certified by manufacturers and in addition, certified for effective calibration by the statutory metrology service or a metrology service accepted by CCS.

4.2.2 Requirements for approval of analysts

4.2.2.1 The chief analyst is to have at least college degree (or an equivalent education), and other analysts are to have at least a special secondary school degree (or an equivalent education).

4.2.2.2 Analysts are to have some basic knowledge of lubricating oil analysis technique.

4.2.2.3 Analysts are to be familiar with the basic principles and testing methods of analytical instruments.

4.2.2.4 Analysts are to hold an appropriate qualification certificate.

4.2.3 Approval procedure

4.2.3.1 An analysis organization and its personnel seeking the approval by CCS are to submit an application to a local Branch of CCS and upon satisfactory initial review, the application will be sent to the Headquarters of CCS for approval. The corresponding analysis work may be carried out only after the analysis organization and its personnel are approved and certified by CCS.

4.2.3.2 The analysis organization and its personnel approved for lubricating oil analysis are to guarantee the analysis quality in accordance with the requirements of these Guidelines for lubricating oil analysis and are responsible for their written analysis reports and conclusions.

4.2.3.3 An analysis organization applying for approval is to submit the following documentation:

(1) name and particulars of the organization;

(2) number, condition and qualification of the analysts to be approved;

(3) type, date of manufacture, name of manufacturer, manufacturer’s certificate, class of accuracy and (or) calibration certificate of analytical instruments;

(4) various management systems;

(5) fees to be charged for service.

4.2.3.4 The analysts applying for approval are to submit the following documentation:

(1) name, age, education background and health condition of the applicant;

(2) technical biography (i.e. experience of lubricating oil analysis) and certificates;

(3) recommendation by the organization and qualification documents.

4.2.3.5 Upon approval by CCS, appropriate certificates will be issued.

4.2.4 Maintenance of approval

4.2.4.1 The approval certificate of the analysis organization and its personnel is valid for five years. An

application for an overall examination is to be made three months before the expiry date of the certificate, and a new certificate will be issued upon satisfactory examination.

4.2.4.2 Within the period of validity of the certificate, the approved organization is in general to be re-examined once a year for the following:

(1) having a general idea of the testing work and management of the organization within the year;

(2) examining the service, maintenance, repair and calibration of analytical instruments and the period of validity of calibration certificates;

(3) the appropriate column of the approval certificate is to be endorsed by the re-examining Branch after the annual re-examination is satisfactorily carried out.

4.2.4.3 Where the re-examination is unsatisfactory, or major failures occur in the work of analysts, or testing data (reports) are false, the approval certificate of the analysis organization and its personnel will be suspended or canceled by CCS as appropriate.

4.2.4.4 The approved analysis organization is to report any changes of its personnel or instruments and equipment to the CCS Branch which has carried out the approval.

4.2.4.5 If considered necessary, the Surveyor is to take part in one of the lubricating oil sample analysis jobs.

4.3 Requirements for analysis organizations and their personnel not approved by CCS

4.3.1 General requirements

4.3.1.1 Where an analysis organization, of which the expenses are borne by the owner, does not apply for the approval by CCS, the lubricating oil analysis information and the related documentation provided by the owner will be regarded as the products supplied to CCS by the client (owner).

4.3.1.2 The lubricating oil analysis services by such analysis organizations and their personnel are to be delivered according to an arrangement agreed by CCS.

4.3.2 Availability of certificates

4.3.2.1 During the annual survey, the owner is to make available the relevant periodical sampling records and analysis reports and in addition, the qualification documents of the analysis organization and its personnel and valid documents of its instruments and equipment.

Appendix 15 GUIDELINES FOR LUBRICATING OIL CONDITION MONITORING SYSTEM OF DIESEL ENGINES

1 General Provisions

1.1 Scope

1.1.1 These Guidelines apply to lubricating oil condition monitoring systems of diesel engines on ships classed with CCS. The class notation for such systems is ECM.

1.2 Application

1.2.1 Where the lubricating oil condition monitoring system of diesel engines is intended for a ship, the owner is to submit an application in writing together with the following information:

(1) Relevant information of diesel engines, including technical parameters, intended type of lubricating oil and its physical and chemical criteria, name and material of parts of oil-lubricated friction pairs. The oil-lubricated friction pairs refer to all friction pairs the lubricating oil of which is supplied by the lubricating system of diesel engines, including those friction pairs the lubricating oil of which is supplied separately by cylinders in the case of crosshead type engines.

(2) Feasibility description, including a valve or an oil outlet which is fitted on the main lubricating oil pipeline between the main lubricating oil pump and the filter and capable of sampling in working condition of engines.

(3) General arrangement of engines, including arrangement of lubricating systems (if already provided, this may not be submitted).

(4) Reports and records of current status of engines to be monitored.

(5) Technical requirements specified by manufacturers of diesel engines and/or lubricating oils for operation, maintenance, monitoring, etc. of their respective products, if any.

1.2.2 One copy of the above-mentioned documentation is to be retained on board the ship.

1.3 Approval of the analysis organization and its personnel

1.3.1 A lubricating oil analysis organization seeking the approval by CCS for carrying out the analysis work, is to make an application to CCS for certification of the organization and its personnel in accordance with the relevant requirements of section 4 of these Guidelines.

1.3.2 Where the owner requires the lubricating oil analysis by a foreign analysis organization, prior agreement of CCS is to be sought.

1.4 Conditions of lubricating oil condition monitoring system of diesel engines

1.4.1 Sampling and analyzing of lubricating oil is to be carried out at an interval dependent on type, rate of revolution, working conditions, performance, etc. of engines. The analysis information is to be kept on board, covering at least the following items:

(1) physical and chemical criteria, including viscosity, water content, flashpoint, total acid number/total insoluble alkalis;

(2) content of elements contained in lubricating oil, including elements of wear metals, additives and contaminants.

1.4.2 Paragraph 1.4.1(1) of this section does not apply to analysis of cylinders of crosshead type diesel engines.

1.4.3 A valve or an oil outlet capable of sampling is to be fitted on the main lubricating oil pipeline between the main lubricating oil pump and the filter. However, the oil samples for physical and chemical analysis may also be taken at a position after the filter, taking into consideration the operability of taking samples in working condition of engines.

2 Surveys of Lubricating Oil Condition Monitoring System of Diesel Engines

2.1 General requirements

2.1.1 For ships having the class notation ECM, the survey of diesel engines is to comply with the relevant requirements of Chapter 5 of this PART and unless required otherwise by 2.1.2 of this section, only an verification examination and a general examination are to be carried out.

2.1.2 The survey of those items not covered by 2.1.3 of this Section is to be in accordance with the relevant requirements of Chapter 5 of this PART.

2.1.3 Survey items to be included in the lubricating oil analysis: Cylinders, pistons, piston rings, piston rods, piston pins, crossheads, crosshead pins, guides, crankshafts and all bearings, connecting rods, piston rod stuffing boxes.

2.2 Initial surveys

2.2.1 The application and documentation submitted by the owner are to be examined to confirm whether the ship has the service conditions for the class notation ECM.

2.2.2 For newbuildings, the periodical sampling analyses are to be carried out at the specified interval from the date of commissioning, as requested by the owner and approved by CCS.

2.2.3 For existing ships, the records and reports of at least three consecutive lubricating oil sampling analyses are to be submitted together with the application by the owner, and the following are to be complied with.

(1) All analysis items in 3.2.2.1 are to be included for the oil in the lubricating system, and 3.2.1.3 is to be complied with for the oil in cylinders.

(2) The time period between the latest sampling and the submission of application is not to exceed an interval between two consecutive samplings, and a verification examination is to be carried out according to 2.3 of this section.

(3) The class notation ECM will be assigned upon approval, and then the periodical sampling analyses are to be carried out at the specified interval from the date of the latest sampling for lubricating oil analysis.

(4) Where the last special survey of diesel engines was carried out 5 years ago, it is recommended that the engine lubricating oil condition monitoring be implemented after the due special survey.

2.2.4 For class-transferred ships which were originally subject to the survey of the engine lubricating oil condition monitoring system, where the owner requests to retain the system, the class notation ECM will be assigned upon a verification examination being satisfactorily carried out in accordance with 2.3 of this section. Subsequent periodical sampling analyses are to be carried out at the originally specified interval.

2.3 Verification examination

2.3.1 The verification examination of the engine lubricating oil condition monitoring system is to be carried out during the annual, intermediate and special surveys of machinery installations.

2.3.2 The verification examination is to be carried out to verify the following:

(1) Approval certificates or other qualification documentation of the lubricating oil analysis organization and its personnel (the lubricating oil analysis report is to be fed back together with copies of such certificates or documentation to the owner by the analysis organization).

(2) Sheets of lubricating oil analysis record and analysis report confirming that monitored parameters and trend analysis are within the normal ranges.

(3) Engine room logbook entries and maintenance records and other parameters recorded since last verification examination are to be checked, e.g. lubricating oil temperature, pressure, exhaust temperature, cooling water (oil) temperature.

2.4 General examination

2.4.1 At the special survey, a general examination is to be carried out in addition to the verification examination.

2.4.2 The general examination is to be carried out as follows.

(1) The maintenance records of diesel engines since last verification examination are to be examined.

(2) Other survey items not covered by lubricating oil analysis are to be examined to confirm whether they have been dealt with as required for the special survey.

2.5 Overhaul conditions

2.5.1 The overhaul of engine parts connected to the lubricating oil condition monitoring system is to be determined according to the lubricating oil analysis results and other performance parameters. Where the analysis results and other performance parameters are normal, the overhaul is not necessary. Where the analysis results and other performance parameters are abnormal, the Surveyor may require an overhaul depending on the actual condition.

2.5.2 Those parts not subject to an effective monitoring according to the engine lubricating oil condition monitoring procedures are to be overhauled according to the specified inspection regime.

2.5.3 Those parts, of which the owner requests to withdraw the lubricating oil condition monitoring, are to be overhauled according to the specified inspection regime.

2.6 Retention of lubricating oil analysis information

2.6.1 The following information is to be well retained on board for check by the attending Surveyor:
(1) the lubricating oil analysis information (to be kept by the chief engineer);
(2) copies of approval certificates or other valid qualification documentation of the lubricating oil analysis organization and its personnel provided to the owner by the analysis organization;
(3) relevant documents or information deemed necessary by the personnel on board or the Surveyor.

2.7 Cancellation of the class notation

2.7.1 At the request of the owner or where the lubricating oil sampling analysis is not carried out on time, the class notation ECM may be canceled and conventional survey is to be restored at the same time. A general overhaul is to be carried out at the next intermediate or special survey.

3 Engine Lubricating Oil Condition Monitoring Procedures

3.1 Sampling procedure

3.1.1 Sampling personnel

3.1.1.1 All oil samples are to be taken by a designated person on board or the chief engineer, who is to ensure that the samples are representative.

3.1.2 Sampling period

3.1.2.1 For diesel engines connected to a lubricating oil condition monitoring system, the sampling period for lubricating oil analysis is to be dependent on type, rate of revolution, working conditions, performance of engines.

In general, the sampling period is 300 to 500 hours or 60 days for medium and high speed diesel engines and 1,000 hours or 90 days for low speed diesel engines. For engines, of which the oil of lubricating system is required to be replaced regularly, the sampling period is not to exceed the oil-replacing period. The sampling period may be adjusted as appropriate, subject to confirmation by the Surveyor.

3.1.2.2 According to lubricating oil analysis results and practical operation condition (e.g. replacing of lubricating oil or abrupt change of wear particle concentration, metallic element content), the Surveyor may require the sampling period to be reduced. Where the sampling frequency is increased by the owner, this is to be recorded for future examination.

3.1.3 Sampling positions

3.1.3.1 Samples are to be taken through the sampling valve or oil outlet fitted on the main lubricating oil pipeline between the main lubricating oil pump and the filter so as to take representative samples. However, the oil samples for physical and chemical analysis may also be taken at a position after the filter.

3.1.3.2 For crosshead type diesel engines, separate samples are to be taken from cylinder oil, and the sampling position may be at the scavenger relief outlet or piston rod stuffing box of each cylinder.

3.1.3.3 For permanent sampling valves and tubes fitted in the pipelines, oil of about twice the volume of residual oil is to be discharged prior to sampling to ensure that no oil sampled at the last time is left.

3.1.3.4 Where samples are taken at oil outlet of the crankcase, an amount of oil is to be discharged prior to sampling to wash away the sediments left there.

3.1.3.5 The sampling positions are to be kept unchanged once they are set.

3.1.4 Sampling condition

3.1.4.1 Samples are to be taken in the normal operation condition of diesel engines.

3.1.5 Sampling record

3.1.5.1 Each time samples are taken, sampling personnel are to fill in the Sampling Record Table carefully and accurately, and affix a label showing sample No., name of the monitored ship, sampling date, service hours of engines and lubricating oil to the sample bottles. The completed Table together with the oil samples is to be sent to the analysis organization.

3.1.6 Sampling precautions

3.1.6.1 Sampling tools (including sample bottles, samplers, tubes, etc.) are to be kept clean, non-fragile and protected from pollution.

3.1.6.2 The quantity of oil samples is to be determined at the discretion of the analysis organization, at least sufficient samples are to be kept for re-testing.

3.1.6.3 Each sample is to be taken for two bottles, one of which is to be sent to the analysis organization and the other kept on board for future use or examination.

3.2 Analysis of lubricating oil samples

3.2.1 General requirements

3.2.1.1 During the lubricating oil sample analysis, in general, the physical and chemical analysis and the spectrum analysis are to be carried out at first and then on this basis, the analysis by direct reading

ferrogram may be carried out. Where it is considered necessary, qualitative analysis is to be carried out by an analytical ferrograph.

3.2.1.2 At the early stage of using the lubricating oil monitoring system, when it is difficult to develop criteria for distinguishing specific objects being monitored or make trend analysis due to insufficient analysis data, physical and chemical analysis, spectrum analysis and ferrographic analysis are to be carried out together.

3.2.1.3 Only spectrum analysis and ferrographic analysis are to be carried out for cylinder oil, and it is recommended that both analysis methods be applied together.

3.2.2 Diesel engine lubricating oil analysis

3.2.2.1 The items of diesel engine lubricating oil analysis are given in Table 3.2.2.1.

Table 3.2.2.1

Analysis items	Means (or tools) of analysis
Physical and chemical analysis	Physical and chemical analysis instrument
Analysis of element content (mainly metal content)	Spectrum analysis (spectrograph for oil analysis)
Analysis of appearance and concentration of wear particles	Ferrographic analysis (ferrograph)

3.2.2.2 Physical and chemical analysis items (items marked with "*" are optional):

(1) viscosity;

(2) water;

(3) flashpoint;

(4) total acid number (TAN)/Total base number (TBN);

(5) content of insolubles;

(6) deterioration* (oxidation, sulphidation, etc.);

(7) diluted fuel oil*.

3.2.2.3 Element content analysis (the owner may increase or reduce the elements listed in Table 3.3.1.2 at his discretion):

(1) Elements relative to material wear of friction pairs:

Cr Pb Cu Ni Fe Ag Ti Mn

Al Zn Si Sn V Mo W Sb

(2) Elements relative to pollution:

Si Na K B

(3) Elements relative to additives:

Ba B Ca Mg P Zn Li

The sources of various elements are to be correctly differentiated in accordance with the materials of friction pairs, additive components of lubricating oil, ambient working environment, etc.

3.2.2.4 Analysis of appearance and concentration wear particles:

(1) Where the appearance of wear particles is analyzed by analytical ferrograph, a classified description is to be made in accordance with the following types of wear particles:

① normal wear particles;

② cutting wear particles;

③ spherical wear particles;

④ fatigue wear particles in lumpy shape;

⑤ laminar wear particles;

⑥ severe sliding wear particles;

⑦ corroded wear particles;

⑧ nonferrous metallic wear particles;

⑨ red oxidic particles;

⑩ black oxidic particles;

⑪ non-metallic crystals;

⑫ carbon deposit;

⑬ rubbed polymer.

(2) Where the quantitative analysis of concentration is carried out by direct-reading ferrograph, the reading values D_l (large particles) and D_s (small particles) are to be measured and recorded.

3.2.3 Determination of criteria for analysis of parameters in lubricating oil analysis

3.2.3.1 Unless provided specially, the criteria of replacing oil as specified for the type of lubricating oil used by the owner, e.g. the relevant National standards, ministerial standards and control criteria of individual oil companies, are to be used in judging physical and chemical parameters of the lubricating oil.

3.2.3.2 The criteria for the quantitative spectrum or ferrographic analysis depend on values accumulated from practical tests and experience to a great extent. The reasonable criteria for judgment are to be determined by comparing the results of sampling tests of the specific monitored objects with the practical operation conditions. In the quantitative spectrum or ferrographic analysis, trend analysis is at present based mainly on the measured values.

Some criteria for spectrum analysis of diesel engine lubricating oil are given for reference in the Annex to these Guidelines.

3.2.4 Analysis of oil samples

3.2.4.1 All lubricating oil samples are to be sent to an analysis organization approved or accepted by CCS for analysis. The analysis organization is to complete the analysis in time and submit an analysis report. Where the analysis results exceed the allowable ranges or any abnormality or uncertainty is found, both the owner and the organization have the obligation to report this to CCS promptly.

3.3 Lubricating oil condition monitoring records, reports and formats

3.3.1 Lubricating oil condition monitoring records and analysis reports

3.3.1.1 Sampling Record Table

Table 3.3.1.1 is an example of the Sampling Record Table, covering the following:

(1) the basic parameters of the monitored object include name of the object, sampling position, measure units used, type of fuel oil, type and volume of lubricating oil, etc.;

(2) the working parameters during sampling include total operating hours of diesel engines, service time of lubricating oil, oil pressure, oil temperature, refilling date and sampling date of lubricating oil, etc.;

(3) the operation and maintenance condition since last sampling is to be entered into the description column of Table 3.3.1.1.

Sampling Record **Table 3.3.1.1**

Name of owner		Name of monitored ship	
Type of diesel engine		Sampling position /Cylinder No.	
Sample No.		Sampling date	
Type of fuel oil		Total operating hours of diesel engine (h)	
Type of lubricating oil		Volume of lubricating oil in use (L)	
Lubricating oil temperature (℃)		Service hours of lubricating oil (h)	
Lubricating oil pressure (MPa)		Volume (L) and time (h) of latest refilling of lubricating oil	
Description:

3.3.1.2 Lubricating Oil Analysis Report

Table 3.3.1.2 is an example of the Lubricating Oil Analysis Report, covering the analysis records and general report of lubricating oil analysis by the following three methods and the owner may add necessary test items into the Table at his discretion:

(1) physical and chemical analysis record, including viscosity, water content, flashpoint, content of insolubles, total acid number/total base number, deterioration and diluted fuel oil;

(2) spectrum analysis record, including test and analysis of content of elements, e.g. metallic particles worn from machinery friction pairs into lubricating oil, metallic particles and pollutants in lubricating oil additive;

(3) ferrographic analysis record, including D_l, D_s record of direct-reading ferrographic analysis.

Lubricating Oil Analysis Report **Table 3.3.1.2**

Ship's name: Owner:	Sample No: Type of diesel engine: Type of lubricating oil: Type of fuel oil: Ferrogram No:

Analysis date	Sampling date	Receiving date	Sampling position	Service hours of lubricating oil (h)	Total operating hours of diesel engine (h)

Physical and chemical analysis

Viscosity (cst)	Water content (%)	Flashpoint (℃)	TBN/TAN (mgKOH/g)	Insolubles (%)	Deterioration (oxidation, sulfidation)	Diluted fuel oil

Spectrum analysis (ppm)

Reviewed by: Stamp of organization:

3.3.1.3 Annual general report

The analysis organization is to prepare an annual general report separately for each diesel engine under lubricating oil condition monitoring, including a general analysis of the monitoring of each engine within the year.

3.3.2 Availability of lubricating oil analysis information

3.3.2.1 All records and analysis reports for lubricating oil condition monitoring are to be prepared in quadruplicate, one is to be retained by the analysis organization for reference, one submitted to CCS for filing, one sent to the owner and the original one kept on board the ship for future examination.

4 Requirements for Approval of Analysis Organizations and Their Personnel

4.1 General requirements

4.1.1 Scope

4.1.1.1 The requirements of this Section apply to the following two types of analysis organizations and their personnel:
(1) analysis organizations established by CCS and their personnel;
(2) analysis organizations and their personnel (subcontractors) applying for the approval by CCS.
4.1.2 General requirements
4.1.2.1 This Section has been prepared in accordance with the requirements of IACS QSCS.
4.1.2.2 The analysis organizations and their personnel applying for the approval by CCS are to pay the relative expenses in accordance with the provisions of CCS.
4.1.2.3 The instruments and equipment of an analysis organization may be purchased at its discretion or leased from other organizations.
4.1.2.4 It is recommended that the owner designate an analysis organization as a permanent partner.

4.2 Requirements for analysis organizations and their personnel applying for approval by CCS
4.2.1 Scope
4.2.1.1 This Section applies to the analysis organizations and their personnel covered by 4.1.1.1(1) and 4.1.1.1(2).
4.2.2 Requirements for approval of analysis organizations
4.2.2.1 The analysis organization is to have a complete set of quality assurance system or quality system for lubricating oil analysis condition monitoring, including:
(1) lubricating oil analysis procedure;
(2) work post responsibility;
(3) analysis result and report review;
(4) files management;
(5) instrumentation management and calibration;
(6) personnel training and assessment.
4.2.2.2 The analysis organization is to be manned according to its workload, with at least four approved lubricating oil analysts, one of whom is to be the chief analyst.
4.2.2.3 The analysis organization is to be provided with appropriate instrumentation and equipment certified by manufacturers and in addition, certified for effective calibration by the statutory metrology service or a metrology service accepted by CCS.
4.2.3 Requirements for approval of analysts
4.2.3.1 The chief analyst is to have at least college degree (or an equivalent education) and is also to be an engineer or have a more superior technical rank, familiar with the analysis technique, skilled at proper operation of instrumentation, and capable of working independently, giving guidance to other analysts and making a correct evaluation of the analysis results. And where the analysis results exceed the limits, he is to be capable of proposing key positions or parts for overhaul and predicting variation trend of lubricating oil against previous analysis reports.
4.2.3.2 Other analysts are to have at least a special secondary school degree (or an equivalent education) and some basic knowledge of lubricating oil analysis technique.
4.2.3.3 All analysts are to be familiar with the basic principles and testing methods of analytical instruments.
4.2.3.4 All analysts are to be trained in lubricating oil analysis technique by an organization approved by CCS and certified for satisfactory training.
4.2.4 Approval procedure
4.2.4.1 An analysis organization and its personnel seeking the approval by CCS are to submit an application to a local Branch of CCS according to relevant provisions and upon satisfactory initial review, the application will be sent to the Headquarters of CCS for approval. The corresponding analysis work may be carried out only after the analysis organization and its personnel are approved and certified by CCS.
4.2.4.2 The analysis organization and its personnel approved by CCS for lubricating oil analysis are to guarantee the analysis quality in accordance with the requirements of these Guidelines for lubricating oil analysis and are responsible for their written analysis reports and conclusions.
4.2.4.3 An analysis organization applying for approval is to submit the following documentation:
(1) name and particulars of the organization;
(2) number, condition and qualifications of the analysts to be approved;
(3) type, date of manufacture, name of manufacturer, manufacturer’s certificate, class of accuracy and (or) calibration certificate of analytical instruments;
(4) quality assurance system or quality system documents;
(5) fees to be charged for service.

4.2.4.4 The analysts applying for approval are to submit the following documentation:
(1) name, age, education background and health condition of the applicant;
(2) technical biography (i.e. experience of lubricating oil analysis) and certificates;
(3) recommendation by the organization and lubricating oil analysis training certificate.
4.2.4.5 Upon approval by CCS, appropriate certificates will be issued.
4.2.5 Maintenance of approval
4.2.5.1 The approval certificate of the analysis organization and its personnel is valid for five years. An application for an overall examination is to be made three months before the expiry date of the certificate, and a new certificate will be issued upon satisfactory examination.
4.2.5.2 Within the period of validity of the certificate, the approved organization is in general to be re-examined once a year for the following:
(1) Having a general idea of the testing work and management of the organization within the year;
(2) Examining the service, maintenance, repair and calibration of analytical instruments and the period of validity of calibration certificates;
(3) The appropriate column of the approval certificate is to be endorsed by the re-examining Branch after the annual re-examination is satisfactorily carried out.
4.2.5.3 Where the re-examination is unsatisfactory, or major failures occur in the work of analysts, or testing data (reports) are false, the approval certificate of the analysis organization and its personnel will be suspended or canceled by CCS as appropriate.
4.2.5.4 If considered necessary, the Surveyor is to take part in one of the lubricating oil sample analysis jobs.
4.2.5.5 The approved analysis organization is to report any changes of its personnel or instruments and equipment to the CCS Branch which has carried out the approval.

Annex Criteria for Spectrum Analysis of Diesel Engine Lubricating Oil

This Annex presents criteria for spectrum analysis of lubricating oil used for the following types of marine diesel engines for reference. The absolute values and abnormal trend values (increments within 10 hours) given in the Tables are to be considered together.

1 The criteria for spectrum analysis of MIL – L – 2104 lubricating oil used for EMD8 – 567 type marine diesel engines are given in Table 1.

Unit: ppm Table 1

	Fe	Ag	A1	Cu	Si	Sn	Pb
Normal	0 ~ 42	0 ~ 38	0 ~ 3	0 ~ 128	0 ~ 14	0 ~ 4	0 ~ 38
Critical	43 ~ 52	39 ~ 47	4	129 ~ 158	15 ~ 18	5 ~ 6	39 ~ 47
Max. limit	53 ~ 65	48 ~ 58	5	159 ~ 197	19 ~ 22	7	48 ~ 58
Abnormal	66 +	59 +	6 +	198 +	23 +	8 +	59 +
Abnormal trend	13	12	2	39	4	2	12

2 The criteria for spectrum analysis of lubricating oil used for FM38D – 8⅛ type marine diesel engines are given in Table 2.

Unit: ppm Table 2

	Fe	A1	Cr	Cu	Si	Pb
Normal	0 ~ 102	0 ~ 9	0 ~ 10	0 ~ 3l	0 ~ 17	0 ~ 19
Critical	103 ~ 126	10 ~ 11	11 ~ 13	32 ~ 48	18 ~ 2l	20 ~ 23
Max. limit	127 ~ 157	12 ~ 14	14 ~ 16	39 ~ 47	22 ~ 26	24 ~ 29
Abnormal	158 +	15 +	17 +	48 +	27 +	30 +
Abnormal trend	31	3	4	9	5	5

3 The criteria for spectrum analysis of lubricating oil used for Cummins VT400 type marine diesel engines are given in Table 3.

Unit: ppm Table 3

	Fe	Al	Cr	Cu	Si	Pb	Sn
Normal	0 ~ 43	0 ~ 9	0 ~ 19	0 ~ 23	0 ~ 21	0 ~ 9	0 ~ 3
Critical	44 ~ 53	10 ~ 11	20 ~ 24	24 ~ 28	22 ~ 26	10 ~ 12	4 ~ 5
Max. limit	54 ~ 67	12 ~ 14	25 ~ 30	29 ~ 36	27 ~ 33	13 ~ 15	6 ~ 7
Abnormal	68 +	15 +	31 +	37 +	34 +	16 +	8 +
Abnormal trend	11	3	7	8	6	2	2

4 The criteria for spectrum analysis of lubricating oil used for Detroit Diesel Allison 3080 type marine diesel engines are given in Table 4.

Unit: ppm Table 4

	Fe	A1	Cr	Cu	Si	Pb
Normal	0 ~ 100	0 ~ 5	0 ~ 10	0 ~ 26	0 ~ n	0 ~ 20
Critical	101 ~ 123	6 ~ 7	11 ~ 12	27 ~ 31	12 ~ 14	21 ~ 25
Max. limit	124 ~ 153	8	13 ~ 15	32 ~ 39	15 ~ 17	26 ~ 3l
Abnormal	154 +	9 +	16 +	40 +	18 +	32 +
Abnormal trend	31	2	4	8	4	6

5 The criteria for spectrum analysis of lubricating oil used for D399 type diesel engines of Caterpillar Company in USA are given in Table 5.

Unit: ppm Table 5

	Fe	A1	Cr	Cu	Si	Pb
Normal	<20	<6	<2	<6	<15	<25
Caution	20 ~ 30	6 ~ 9	2 ~ 6	6 ~ 9	15 ~ 20	25 ~ 40
Abnormal	31 ~ 40	10 ~ 12	7 ~ 10	10 ~ 12	21 ~ 30	41 ~ 75
Warning	>40	>12	>10		>30	>75

Appendix 16 GUIDELINES FOR SURVEY OF PLANNED MAINTENANCE SCHEME（PMS）FOR MACHINERY

1 General

1.1 Purpose

1.1.1 The Guidelines for Survey of Planned Maintenance Scheme (PMS) for Machinery may be regarded as guidance notes for CCS Surveyors, owners, ship management company and chief engineers in carrying out the PMS.

1.2 Scope

1.2.1 These Guidelines apply to the ships having the class notation PMS.

1.2.2 PMS may be regarded as an alternative to the continuous machinery survey (CMS) and the survey items and contents are to cover those of the related continuous survey.

1.2.3 PMS considers surveys to be carried out on the basis of intervals between overhauls recommended by manufacturers, documented operator's experience and a condition monitoring system, where fitted.

1.2.4 For a ship which is subject to survey of PMS, any other survey items necessary for maintaining its class is not to be canceled and changed, and the items not included in survey of PMS are to be surveyed in compliance with Chapter 5 of this PART.

1.3 Requirements for owner or ship management company

1.3.1 Organizational unit and personnel

(1) The owner or ship management company applying for implementation of survey of PMS is to establish a special organizational unit to manage the PMS. The department of machinery business may act as such unit or a specialized department may be set up. In all cases, a person in charge is to be assigned.

(2) The organizational unit is responsible for the PMS documentation and PMS daily management.

1.3.2 Plan formulation

(1) The PMS department of the owner or ship management company is to make a list of PMS equipment in accordance with the relevant requirements of the Rules and the specifications of manufacturers.

(2) The list of PMS equipment is to cover the items of special machinery survey or continuous machinery survey required by the Rules, and each maintenance interval is to be determined and detailed maintenance plan is to be made in accordance with the specifications of manufacturers and the actual operation of equipment on board; the items not required in the specifications of manufacturers are to be overhauled at least once within a five-year survey period of PMS.

(3) The computerized PMS management system is to be programmed in accordance with the above-mentioned documentation.

1.3.3 Maintenance intervals and examination items

(1) When the ship is subject to PMS survey, contents of preventive maintenance are to be included in the PMS schedule in accordance with the specifications of machinery and requirements of CCS Rules, and items subject to confirmatory examination each year and items to be overhauled within a five-year survey period specified as special survey items in the current CCS Rules are also to be included in PMS schedule.

(2) In general, the intervals between any two PMS surveys are not to exceed 5 years.

(3) For items which are subject to survey based on running hours, intervals exceeding 1 year may be accepted, but not to exceed 5 years.

(4) Items subject to confirmatory examination each year and items to be overhauled once within a five-year survey period are to be indicated by "F" and "H" respectively in Annex "Items for Survey of PMS" to this Appendix.

1.3.4 Requirements for PMS database system

(1) Documentation requirements

① software development unit is to be provided with business license for business entity and qualification certificates for developing relevant software;

② system specifications;

③ operation manual (instructions for use);

④ reports and plans for testing which have been carried out (all software functions in various operation modes, important function combinations, relevance are to be included);

⑤ instructions of system key algorithm (included in system specifications or provided individually);

⑥ other relevant technical specifications.

(2) Function requirements

① management of code: complete standard code management system (all PMS items may be covered and requirements of CCS Rules and guidelines are met);

② management of survey plan

a. each overhaul of the item are covered during the preparation of the plan and requirements of rules or specifications are complied with;

b. indication is to be provided that the item has entered the survey period when the planned date enters the windows (such as first three months) and automatic alarms will be given when the item is overdue;

c. the PMS survey plan of any intervals within a period may be inquired and printed;

d. the arranged PMS survey plan distribution in the system may be overviewed;

e. the planned completion time for each PMS item and allowable flexible range may be indicated;

f. when the completion time of one item is inputted, the subsequent plan grade and date may be generated automatically;

g. items within windows, overdue items and failed items in the survey plan may be clearly identified;

③ Management of working sheets

a. working sheets of any survey items may be inquired and printed;

④ Management of work report

a. survey reports may be generated automatically while the working contents are inputted;

b. survey items of any interval within a period may be inquired and printed (at least name of PMS equipment/standard code/planned time/completion time are to be included);

c. survey reports of any interval within a period may be inquired and printed;

d. the common format of testing report is considered to be included in the database;

⑤ Correction/self-checking function

a. software is to be capable of identifying normal faulty operation and correcting automatically;

b. software is to be capable of testing normal mistakes in database;

(3) Compatibility

① software is to be with good compatibility;

② requirements for hardware are to be with generality and not to be over demanding;

(4) Information security

① effective backup system and measures are to be provided;

② stable data synchronization scheme and correction and recovery capability in dealing with data conflict and document missing etc.;

③ modification of procedure/plan

a. specific level of modification permission is to be determined in order to prohibit illegal modification of procedures and plans;

b. records must be kept for change of the plan and are to be easy to inquire;

④ the system is to be with a certain anti-virus capabilities;

(5) software is easy and simple to operate;

(6) Only the software developer or personnel authorized by the developer is permitted to update and modify the documentation and information in database. Contents of update and modification are to be described when the company and ship are subject to the annual audit and are to be confirmed by the Surveyor to be valid;

(7) A Statement of Compliance of management system (software) of planned maintenance scheme for machinery issued by CCS is to be acquired for the above requirements. The period of validity of Statement of Compliance is 5 years and the renewal audit is to be carried out once every 5 years to ensure the effectiveness of the software after maintenance, upgrading or update.

1.3.5 Implementation of the plan

(1) The chief engineer is to complete the required items in time in accordance with the monthly maintenance plan generated automatically by computer and PMS management system installed on board.

(2) The ship is at least to report the monthly completion to the PMS department in accordance with the document requirements of the company and the PMS department is responsible for collecting the information, statistics and supervision of the completion and is to give feedback to the ship of the supervision comments or advise on the completion of PMS in time.

1.3.6 Reports
(1) The PMS department of the owner or ship management company is to submit PMS completion to CCS for confirmation when applying for CCS PMS survey.
(2) When the ship applies for the annual classification survey, the owner or ship management company is to submit an application for PMS annual audit simultaneously; the Surveyor is to carry out confirmatory examination on board (see items indicated by "F" in Annex "Items for Survey of PMS" to this Appendix); when the special classification survey is due, the owner or ship management company is also to submit an application for PMS annual audit simultaneously, and the Surveyor is to carry out confirmatory examination on board (see items indicated by "F" in Annex "Items for Survey of PMS" to this Appendix).
1.3.7 Responsibilities of chief engineer
(1) The chief engineer is responsible for implementation of PMS on board.
(2) The chief engineer is responsible for arranging maintenance of each PMS item. The maintenance is to be carried out in accordance with the requirements of preventive maintenance and techniques which have been inputted in PMS computer system and the necessary records of maintenance and measurement are to be kept. The relevant maintenance reports are to be examined or confirmed and signed by the chief engineer.
(3) In general, the chief engineer is to undertake PMS related trainings organized by CCS or ship company.
1.3.8 Where the shipping company or ship management company is changed and the class notation PMS of ship needs to be maintained, the new shipping company or new ship management company is to re-submit the changed parts to CCS for audit and confirmation in accordance with the requirements of 1.3.1 to 1.3.7.

1.4 Definitions
1.4.1 Ship repair and maintenance system (CWBT) combines the traditional onboard equipment management with the internationally used card-inserted type management to form a new, scientific and practical mode of onboard equipment management, including planning, management and guidance. Its abbreviation CWBT consists of the initials of Chinese phonetic letters for the four Chinese words Chuanbo (ship), Weixiu (repair) Baoyang (maintenance) and Tixi (system).
1.4.2 Planned maintenance scheme (PMS) means a detailed periodical maintenance plan for machinery (including electrical installations) onboard made by the owner or ship management company in accordance with the relevant requirements of the Rules and the specifications of manufacturers. Through the implementation on board, the machinery will be always kept in good technical condition. Such planned management of periodical maintenance for machinery is called planned maintenance scheme.
1.4.3 Planned maintenance system (PMS) for machinery survey means a system as an alternative to CMS for machinery (including electrical installations), which is applied for by the owner or ship management company and subject to approval by CCS.
1.4.4 Confirmatory audit means confirmation of validity of the class notation PMS. For the survey of PMS, an annual audit is to be made in accordance with the requirements of 3.2 of Section 3 when the annual/intermediate/special survey is carried out every year.
1.4.5 Implementation survey means the first confirmatory survey of PMS for the ship which applies for survey of PMS within one year of its trial.

1.5 Appendix
1.5.1 The Items for Survey of PMS in the Appendix of these Guidelines are only for reference for the owner or ship management company and PMS computer programming personnel in formulating the PMS and developing the programs.
1.5.2 CWBT code in the Items for Survey of PMS is recommended to be used where no international code system is available.

2 Procedural Requirements

2.1 Application
2.1.1 The owner of the ship or ship management company, for which PMS is intended, is to submit an application for the assignment of PMS notation to the Headquarters or a survey unit of CCS.
2.1.2 After the owner or ship management company is provided with PMS notation, application for PMS implementation of the ship is to be made on the completion of initial classification survey or special machinery survey or continuous machinery survey.
2.1.3 For the ship which is under continuous survey, where the owner or ship management company applies to CCS for PMS implementation, the items of the original continuous survey may be confirmed,

provided the survey of PMS items can be reasonably arranged, and the items for survey of PMS are to cover all those of the continuous survey. And it is to be ensured that the interval between the completion date of the original continuous survey and the next PMS maintenance date will not exceed 5 years.

2.1.4 For the ship which applies for PMS between two special surveys, where all items of special machinery survey can be reasonably arranged within the remaining special survey period (from the application date to the due date of this special survey), the survey of PMS implementation may also be carried out.

2.2 Approval documentation

2.2.1 While the owner or ship management company applies to CCS for assignment of PMS notation, the following written documentation or electronic file are to be submitted for approval:

(1) Organization chart identifying related posts (responsibilities);

(2) PMS documentation preparation procedure (or preparation instructions);

(3) List of PMS equipment;

(4) Description of identification of PMS equipment (or PMS number);

(5) Preventive maintenance items for each unit of PMS equipment;

(6) Maintenance plan for each unit of PMS equipment (for the equipment to be surveyed according to running hours, the hours of overhaul period are to be indicated in the plan and to be calibrated to be overhauled once every 5 years);

(7) Statement of Compliance of management system (software) of planned maintenance scheme for machinery issued by CCS.

2.2.2 For the series ships or sister ships, if PMS equipment of which are the same, documentation provided in accordance with 2.2.1 are to cover all the applicable ships.

2.3 Documentation to be kept on board

2.3.1 The following documentation are to be kept on board:

(1) All items of 2.2 above in an up-to-date version;

(2) Maintenance specifications of manufacturers and shipyard;

(3) Reference documents (trend analysis procedure, etc.);

(4) Records of maintenance, including repairs and renewals carried out.

2.4 Approval

2.4.1 After receipt of the application and documentation submitted by the owner or ship management company, CCS is to examine the documentation in time. Upon satisfactory examination, CCS will arrange the audit of the PMS Department established by the owner or ship management company in accordance with the relevant requirements of 1.3.

2.4.2 When the owner or ship management company has the ships which have been assigned with PMS notation or have been PMS surveyed, requirement of 2.4.1 for audit of the PMS department may be exempted.

2.5 Assignment of class notation

2.5.1 The ship which has been approved to implement the PMS is to apply for an occasional machinery survey to:

(1) confirm that the documentation specified in 2.3 are complete and meet the requirements;

(2) confirm that the PMS survey plan covers all items of the continuous machinery survey.

2.5.2 After the confirmation, the survey unit may issue an interim classification certificate to the ship and assign the PMS notation.

2.5.3 For the ship which is assigned the class notation PMS for the first time, a class memorandum is to be given and Implementation Survey is to be carried out by CCS Surveyor within one year since the approval date of PMS.

3 Survey Requirements

3.1 Implementation survey

3.1.1 For the ship which begins to carry out the PMS, trial is to be completed before implementation of the survey. After the trial is finished, the owner or ship management company is to apply to CCS for an implementation survey.

3.1.2 The Surveyor is to confirm the following:

(1) PMS has been implemented according to the approved documentation and the PMS computer

management procedures on board are suitable for the onboard equipment and system.
(2) The documentation necessary for the PMS annual audit and surveys/test necessary for maintaining the ship's class are provided.
(3) Engineers are familiar with PMS procedures.
3.1.3 When this survey is carried out and the implementation is found in order, a report describing the implementation of PMS is to be submitted to CCS survey unit by the owner or ship management company. The approved PMS may replace CMS.

3.2 Annual Audit①

3.2.1 A confirmatory audit is to be carried out during annual/intermediate survey every year for the ship under PMS, and it is preferably to be carried out concurrently with the annual/intermediate survey.
3.2.2 During the annual confirmatory audit, the surveyor is to review the detailed record or verify that it has been reviewed by CCS. The detailed record is to include at least the information required in 2.2.1(3) and (5) as well as any change to other paragraphs of 2.2.1.
3.2.3 During the annual audit, the Surveyor is to examine the following items when reviewing the detailed record submitted by the owner or ship management company.
(1) The confirmation examination is to be carried out for PMS computer management system. Verifying that PMS is being correctly and effectively implemented and that the machinery has been functioning satisfactorily since the previous annual audit, together with a general examination of the relevant PMS preventive maintenance items and completion of plans.
(2) The performance and maintenance records are to be examined to verify that the machinery has functioned satisfactorily since the previous annual audit or action has been taken in response to machinery operating parameters exceeding acceptable tolerances and the overhaul intervals have been maintained according to the requirements of the Rules and manufactures.
(3) Examining written details of breakdown or malfunction.
(4) The description of repairs carried out is to be examined. Any damaged machinery part, which has been replaced by a spare one, is to be retained on board – where possible – until examined by the Surveyor; where necessary, the chief engineer is to take photographs for such examination. For the renewed essential parts required by the Rules, the relevant product certificate is to be provided.
(5) When the Surveyor deems, in examining maintenance records, that the measured data are not correct or that the data exceed acceptable tolerances with no renewal being made and that the machinery malfunction is not properly handled, he may require the chief engineer to open the equipment for further survey.
(6) General examination is to be carried out for items indicated by "F" in Annex "Items for Survey of PMS" to this Appendix, and all items indicated by "H" which have been completed form the previous annual audit to this annual audit are to be verified and visual examination to be carried out.
(7) For the items indicated by "F" in Annex "Items for Survey of PMS" to this Appendix, when the overhaul time coincides with the time of annul audit, confirmatory examination is to be carried out under the surveyor's supervision; for the items indicated by "H" in Annex "Items for Survey of PMS" to this Appendix, when the overhaul and test time coincides with the time of annul audit, overhaul and test are to be carried out under the surveyor's supervision.
(8) According to the audit and examination results, the Surveyor is to issue an appropriate audit report and the PMS notation is to be retained.

3.3 PMS audit during special class survey

3.3.1 When the special class survey is due, the owner or ship management company is to apply for special survey and PMS annual audit.
3.3.2 The detailed record of PMS implementation to be submitted by the owner or ship management company and the survey requirements of the Surveyor are the same as 3.2.2 and 3.2.3 above.
3.3.3 The Surveyor is to verify that the examination of items indicated by "H" in Annex "Items for Survey of PMS" to this Appendix has been completed or the maintenance and function test completed by the ship's engineer at least once within the period of 5 years.
3.3.4 For the items indicated by "F" in Annex "Items for Survey of PMS" to this Appendix, when the overhaul time coincides with the time of special class survey, confirmatory examination is to be carried out under the surveyor's supervision; for the items indicated by "H" in Annex "Items for Survey of PMS" to this Appendix, when the overhaul and test time coincides with the time of special class survey, overhaul and test are to be carried out under the surveyor's supervision.

---

① The term audit, in this context, is not related to ISM audit, the implementation of surveys is to be completed prior to the commencement of the audit.

3.3.5 Where the special class survey is due and cannot be completed due to other reasons, the owner or ship management company may apply for extension. Where found satisfactory①, an extension not exceeding 3 months may be granted for the special class survey and PMS annual audit. Such survey and audit are to be carried out in accordance with the requirements of 3.3.1 to 3.3.3 by the end of the extension.

3.4 Damage and repair survey

3.4.1 The damage of PMS equipment (including components) is to be applied for to CCS for occasional class survey. The repairs of such components/machinery are to be carried out to the satisfaction of the Surveyor.

3.4.2 Any repair and corrective action regarding machinery under PMS are to be recorded in the engine logbook and the result of the repair of the machinery is to be verified by the Surveyor at the annual audit.

3.4.3 In the case of overdue conditions of class or a record of unrepaired damage which would affect the PMS, the relevant items are to be kept out of the PMS, i.e. subject to the inspection by the Surveyor until such conditions of class are fulfilled.

3.5 Change of plan

3.5.1 In general, the maintenance interval of items indicated by "H" of PMS items are to be implemented in accordance with the requirements of 1.3.3 of these Guidelines.

3.5.2 The maintenance plan may be properly adjusted by the owner or ship management company or chief engineer according to the maintenance of equipment and the operation of ship, however, the maximum interval between two maintenances for items indicated by "H" of PMS items is not to exceed that required in 1.3.3, i.e. not to exceed 5 years.

3.5.3 Where the chief engineer has completed the maintenance of a certain PMS item indicated by "H" in advance, the interval between the completion date and the next maintenance date is to comply with that specified in 1.3.3, i.e. not exceeding 5 years.

3.6 Withdrawal and cancellation

3.6.1 The owner or ship management company may apply for the withdrawal of PMS in writing to restore the special or continuous machinery survey.

(1) Where application for the withdrawal of class notation PMS and assignment of class notation CMS is made during special class survey, the survey unit is to examine all PMS items according to the equipment maintenance plan of PMS to confirm that the continuous survey may be restored directly after all due items for survey of PMS have been completed. The continuous machinery survey (CMS) scheme is to be prepared by the attending Surveyor in conjunction with the completion date of PMS survey items of a five-year period.

(2) When applying for the withdrawal of class notation PMS and assignment of class notation CMS during the second to the fourth PMS annual audits, the survey unit is to examine all PMS items according to the equipment maintenance plan of PMS to confirm that all due PMS items before applying for the withdrawal of class notation PMS have been completed. Items indicated by "H" among PMS items to be completed until the expiry date of the special survey are to be prepared into the continuous machinery survey (CMS) scheme and these continuous survey items are to be completed within the period between the date on the continuous machinery survey (CMS) scheme and expiry date of special survey.

(3) Where application for the withdrawal of class notation PMS and application for special class survey are made during special class survey, the survey unit is to examine all PMS items according to the equipment maintenance plan of PMS. After confirming that all due PMS survey items have been completed, items other than those indicated by "H" among PMS items completed within 15 months prior to the expiry date of the special survey period are to be overhauled to the satisfaction of the Surveyor, and the special survey may be restored.

(4) Where application for the withdrawal of class notation PMS and application for special class survey are made during the second to the fourth PMS annual audits, the survey unit is to examine all PMS items according to the equipment maintenance plan of PMS. After confirming that all due PMS survey items have been completed, items other than those indicated by "H" among PMS items completed within 15 months prior to the expiry date of the special survey period are to be overhauled to the satisfaction of the Surveyor, and the special survey may be restored. For ships of first PMS period, where application for the withdrawal of class notation PMS is made during the second to the fourth PMS annual audits, conversion

---

① Before PMS annual audit is extended, the surveyor is to re-check the outstanding recommendation or condition of class, PMS items are to be confirmed as far as practicable and the rest of the PMS items are also to be confirmed to ensure that the ship's safety is not affected.

may be made directly to special class survey. When special survey is due, implementation is to be in accordance with requirements for special survey.

3.6.2 Where the survey unit finds that the ship has not dealt with the survey of PMS seriously, it is to report this to the Headquarters. The Headquarters will remind the owner or ship management company in writing as appropriate, or require the owner or ship management company to take corrective actions within a specified period and failure to do so will result in cancellation of the class notation PMS. On that occasion, the survey is to comply with the requirements of 3.6.1 above.

Annex:

Items for Survey of PMS

PMS No.	CWBT code	Item	Details
1	MD-100-000-000	Diesel engine	
1.1	MD-101-000-000	Diesel engine	F① 1. General inspection
1.1.1	MD②-101-000-000 GD③-101-000-000	Cylinder cover	H④ 1. Inspecting each connected flange around cylinder cover and valve hole for defects, e.g. crack, ablation, unevenness. 2. Inspecting cooling water jacket space for scale and corrosion. 3. 0.7 MPa hydraulic test of cooling water jacket space after repair or where necessary
1.1.2	MD-102-010-000 GD-102-010-000	Piston	H Trunk piston: 1. Inspecting piston head, suspension lug, piston ring groove, piston pin hole, piston skirt, etc. for crack and ablation, and repair or renewal to be made where necessary. 2. Measuring and recording. H Crosshead type engine piston: 1. Inspecting piston head, suspension lug, piston ring groove and wear ring for crack, ablation, excessive wear, loosening, etc. 2. Inspecting water jacket space for scale and cleaning where necessary, hydraulic test. 3. Measuring and recording
1.1.3	MD-102-018-000 GD-102-018-000	Connecting rod	H 1. Inspecting the connecting rod for crack. 2. Inspecting bolts for crack, deformation, loosening, thread damage, and detection or renewal to be made where necessary
1.1.4	MD-102-011-000 MD-102-014-000	Piton rod Stuffing box	H 1. Cleaning, inspecting, measuring and recording. 2. Aligning the center and air clearance where necessary. 3. Disassembling, cleaning and inspecting the stuffing box, and renewing stuffing where necessary
1.1.5	MD-103-009-000 GD-103-009-000	Cylinder liner	H 1. Inspecting the cylinder liner for crack, scotch and excessive wear, etc. 2. Drawing out the liner for clean and inspection, and renewing the packing ring periodically in accordance with specifications. 3. Measuring and recording
1.1.6	MD.GD-101-002-000 MD.GD-101-003-000 MD.GD-101-005-000 MD.GD-101-006-000 MD.GD-101-007-000	Intake valve Exhaust valve Safety valve Indicator valve Starting valve	H 1. Inspecting casing, core and spring of each valve for crack, whether the working face between valve and valve seat is in normal order, and detection of valve rod to be made where necessary. 2. Checking the safety valve with opening pressure not exceeding 1.4 times the maximum combustion pressure
1.1.7	MD-102-015-000 MD-102-016-000	Crosshead pin & bearing Guide plate & sliding block	H 1. Inspecting the crosshead pin for crack and scotch, and detection to be made where necessary. 2. Inspecting crosshead pin, bearing and white metal of guide plate for crack, overheat, scotch, shelling, whether the connection is in order, and inspecting the connecting bolt. 3. Measuring the crosshead pin and recording. 4. Measuring the clearances of bearing, sliding block and guide plate and recording. 5. Correcting and adjusting where necessary

① F is the item of annual confirmatory survey.

② MD is the main diesel engine (main engine).

③ GD is the prime motor of diesel generating set (auxiliary engine).

④ H is the item overhauled at least once within each period of survey of PMS and the test of some systems.

PMS No.	CWBT code	Item	Details
1.1.8	MD-102-018-000	Bearing of connecting rod	H 1. Inspecting the bearing for crack, shelling, overheat, scotch, breakaway and other contact, wear conditions. 2. Measuring crank pin and recording. 3. Measuring clearance of bearing and recording
1.1.9	MD-106-000-000 GD-105-000-000	Transmission mechanism of intake valve Transmission mechanism of exhaust valve	H 1. Inspecting and measuring clearance of roller. 2. Inspecting the push rod and push rod seat
1.1.10	MD-103-055-000 GD-103-057-000	Frame & bedplate	H 1. Visual inspection for crack, deformation, damage, corrosion, etc. 2. Inspecting connection of frame, bedplate and cylinder block. 3. Hammering check of bolts and rivets for damage, fracture and tightening
1.1.11	MD-103-056-000 GD-103-056-000	Crankcase & safety device	H 1. Visual inspection. 2. The spring of explosion-proof door has no fracture and the valve is in order
1.1.12	MD-103-059-000 GD-103-055-000	Foundation bolts & packing blocks	H 1. Visual inspection. 2. Inspecting foundation bolts for loosening or fracture. 3. Inspecting the tightening of packing blocks and bolts
1.1.13	MD-104-020-000 GD-104-020-000	Main bearing & shaft journal	H 1. Inspecting the bearing for crack, shelling, overheat, scotch and contact, wear conditions. 2. Inspecting the shaft journal for scotch, pitting corrosion, and detection to be made where necessary. 3. Gauging the wear-down of crankshaft by bridge gauge, and where necessary, measuring and recording eccentric deviation. 4. Measuring thickness of bearing pillow, bearing clearance and recording. 5. Measuring the shaft journal and recording when the crankshaft is lift
1.1.14	MD-104-069-000 GD-104-168-000	Transmission mechanism of crankshaft	H 1. Tooth gear: inspecting the gear for crack, erosion, collapse, excessive wear, gear engagement and lubrication, measuring side clearance of the gear and recording. 2. Chain gear: inspecting links and rollers for crack, erosion, and wear, whether rollers are in order, and detection to be made and pre-tightening of chain adjusted where necessary
1.1.15	MD-105-000-000 GD-105-000-000	Camshaft Camshaft bearing	H 1. Inspecting the procedure for tightening cam on the shaft. 2. Inspecting the surface of cam for crack, pitting corrosion, scotch and excessive wear. 3. The bearing may not be dismantled where it has been in good operation with normal appearance and has not been repaired. 4. Overhauling, and measuring and recording the size and eccentric deviation of shaft journal and the clearance of bearing
1.1.16	MD-106-314-100	Scavenging fan	H 1. Inspecting the coupling and impeller. 2. Inspecting the automatic control device, and effectiveness test
1.1.17	MD-106-314-200	Emergency air blower	H 1. Inspecting the coupling and impeller. 2. Inspecting the automatic & manual control devices, and effectiveness test
1.1.18	MD-106-079-000	Scavenging pump	H 1. Piston-type scavenging pump: Inspecting piston, piston rod, cylinder liner, intake valve, exhaust valve for crack, scotch and excessive wear. Measuring the clearances of piston, piston ring, cylinder liner and bearing and recording. 2. Revolving scavenging pump: Inspecting pump case, impeller or gear, shaft, bearing and transmission gear components for crack, deformation, excessive wear, etc.
1.1.19	MD-107-029-000 GD-106-029-000	High-pressure oil pump	H 1. Overhauling the pump case and spring for defects, e.g. crack, deformation. 2. Inspecting the plunger, inlet valve and outlet valve for defects, e.g. crack, wear, scotch, pit corrosion, burr. 3. Check periodically
1.1.20	MD-109-051-000	Exhaust-gas	H 1. Inspecting the casing for crack, the cooling water jacket

PMS No.	CWBT code	Item	Details
	GD-109-051-000	turbocharger	space for scale and the corrosion, and thickness measurement to be made where necessary. Hydraulic test with 1.5 times working pressure (not less than 0.4 MPa) for cooling water jacket space of the casing. 2. Lifting out and inspecting the rotor, blades, guide blade and diffuser for defects, e.g. crack, bending, deformation, collapse, corrosion, and dynamic balance test to be made and a report submitted where necessary. 3. Inspecting the bearing for defects and renewing it in accordance with the specifications
1.1.21	MD-109-052-000 GD-109-052-000	Air cooler	H 1. To inspect whether the pipe and tube plate have deformation, damage, scale, corrosion, etc. 2. To wash the air and water jacket space. 3. To renew corrosion-proof zinc block. 4. Hydraulic test with 1.5 times working pressure is made at the side of air cooler
1.1.22		Spare parts and stores	H 1. The number of main spare parts is not less than the requirements of CCS Rules
1.1.23	MD-103-058-000 GD-103-058-000	Through bolt	H 1. To check the pre-tightening of through bolt in accordance with the specifications
1.1.24	MD-104-021-000 GD-104-021-000	Vibration damper or antivibrator	H 1. Flexible base: Inspecting the vibration isolating rubber and spring for damage. 2. Back balance antivibrator: to inspect the tightening of back balance and bolt. 3. Hydraulic spring-type antivibrator: Opening the covers at both sides of antivibrator, inspecting whether the spring unit, locating pin and oil hole are in order and unblocked, inspecting oil quality
1.1.25	MD-106-000-000	Scavenging air receiver & safety device	H 1. Opening scavenging receiver and cleaning manifold and the internal of receiver. 2. Inspecting internal valves and fittings, and repairing or renewing components where necessary. 3. Inspecting the passage of nozzles of emergency fire-extinguishing appliances. 4. Inspecting the reliability of explosion-proof door of scavenging receiver and valves
1.1.26	MD-01-10-025-000	Reversing arrangement	H 1. Inspecting components, e.g. reversing cam, reversing valve, reversing servo mechanism. 2. Overhauling relevant components, valves, etc. periodically in accordance with the specifications. 3. Effectiveness test
1.1.27	MD-109-061-000	Carriage turning gear (jacking engine)	H 1. Inspecting wear of worm wheel and worm. 2. Inspecting the reliability of carriage turning gear and interlocked valve. 3. Inspecting the coupling of motor and carriage turning gear. 4. Effectiveness test
1.1.28	MD-110-000-000 GD-108-152-000	Engine-driven air compressor	H Where engine-driven pump is a reciprocating pump: 1. Inspecting the reliability of engine-driven transmission mechanism. 2. Inspecting piston, piston rod, cylinder liner, air inlet valve, exhaust air (water, oil) valve and spring for crack, scotch and excessive wear. 3. Lifting out the piston and connecting rod, measuring the clearance of bearing and recording. 4. Effectiveness test and checking the safety valve H Where engine-driven pump is a rotating-type pump: 1. Inspecting the reliability of engine-driven transmission mechanism. 2. Inspecting the casing, impeller or gear or worm, bearing, shaft, shaft gland and components for crack, deformation, excessive wear, and renewal to be made where necessary. 3. Effectiveness test H Engine-driven air compressor: 1. Inspecting the items as shown in 5.1
1.1.29	MD-110-000-000	Engine-driven bilge pump	
1.1.30	MD-110-000-000 GD-106-141-000	Engine-driven diesel oil booster pump	
1.1.31	MD-110-000-000 GD-106-141-000	Engine-driven fuel oil booster pump	
1.1.32	MD-110-000-000 GD-106-141-000	Engine-driven diesel oil delivery pump	
1.1.33	MD-110-000-000 GD-106-141-000	Engine-driven fuel oil delivery pump	
1.1.34	MD-110-000-000 GD-107-142-000	Engine-driven freshwater pump	
1.1.35	MD-110-000-000 GD-107-142-000	Engine-driven cooling freshwater pump	
1.1.36	MD-110-000-000 GD-106-142-000	Engine-driven cooling pump of fuel injector	
1.1.37	MD-110-000-000	Engine-driven lub.	

PMS No.	CWBT code	Item	Details
		oil pump	
1.1.38	MD-110-000-000	Engine-driven reduction gear lub. oil pump	
1.1.39	MD-110-000-000	Engine-driven seawater circulating pump	
1.1.40	MD-110-000-000	Engine-driven seawater cooling pump	
1.1.41	MD-110-000-000	Engine-driven freshwater cooler	H 1. Cleaning seawater jacket space, renewing corrosion-proof zinc block and inspecting end cover gasket. 2. Washing freshwater jacket space. 3. Hydraulic test
1.1.42	MD-110-000-000	Engine-driven lub. oil cooler	H 1.Cleaning seawater jacket space, renewing corrosion-proof zinc block and inspecting end cover gasket. 2. Washing freshwater jacket space. 3. Hydraulic test
1.2	MD-110-000-200 GD-108-148-000	Partial pipeline of starting air system	H 1. Visual inspection for corrosion, damage or leakage trace, and hydraulic test or thickness measurement to be made where necessary. 2. Disassembling some valves and pipeline lengths of starting air system for internal inspection. 3. Checking the safety valve of starting air manifold (if any) with the pressure not exceeding 1.1 times working pressure. 4. Inspecting the tightness
1.3	MD-104-019-000 GD-104-019-000	Crankshaft	H 1. Inspecting the shaft journal of crankshaft for scotch, pitting corrosion, mechanical damage and wear, inspecting the fillet and oil hole for crack. 2. Inspecting crankshaft cylinder liner or press fit or loosening or offset. 3. Inspecting the reliable tightening of flange connection for sectional crankshaft and of back balance for assembled crankshaft. 4. Measuring the shaft journal of crankshaft and recording. 5. Measuring the crankshaft deflection and recording
2	MT-000-000-000	Turbine	
2.1	MT-000-000-000	Steam turbine	F 1. General inspection
2.1.1	MT-101-000-000	Cylinder block & cylinder cover	H 1. Dismantling the cylinder block and bedplate and inspecting for crack or other defects. 2. Inspecting for the tight connection of cylinder block and bedplate and for fracture of bolts. 3. Inspecting the joint surface of cylinder for mechanical damage and leakage trace. 4. Inspecting the bolts connecting upper and lower cylinder blocks for damage or crack. 5. Measuring the axial clearance of heat-expansion-prevention separator of cylinder and recording. 6. Inspecting the separator for corrosion, loosening and crack. 7. Inspecting the steam seal for wear, deformation or leakage
2.1.2	MT-103-310-000 MT-103-310-200 MT-103-310-300	Rotor, blades	H 1. Inspecting the rotor for deformation, loosening and crack. 2. Inspecting, measuring the working shaft journal and recording. 3. Inspecting the blade for defects, e.g. crack or wear, and detection to be made as the circumstance dictates. 4. Inspecting the blades for loosening and for securing of final blade, locking block, bracing, skirt and blades. 5. Inspecting the installation of rotor, measuring axial/radial clearances between rotor and separator and recording
2.1.3	MT-103-171-000 MT-103-171-200 MT-103-171-300	Elastic coupling	H 1. Inspecting for the connection and for defects of bolts. 2. Alignment. 3. Inspecting the elastic elements for crack and damage
2.1.4	MT-107-000-000	Condenser and steam bleeder	H 1. Inspecting the tube plate, pipe head and end cover for leakage and corrosion. 2. Inspecting the effectiveness during operation
2.1.5	MT-102-000-000	Main bearing, thrust pad and oil seal	H 1. Inspecting the white metal and thrust face of bearing. 2. Inspecting, measuring axial/radial clearances and recording.

PMS No.	CWBT code	Item	Details
			3. Gauging the wear-own of shaft journal by bridge gauge and recording. 4. Inspecting wear, deformation or leakage
2.1.6		Steam reheater	H 1. Inspecting the tube plate, pipe head and end cover for leakage and corrosion. 2. Inspecting the effectiveness during operation
2.1.7	TS-105-153-000	Steam superheater	
2.1.8		Heat reducer	
2.1.9	MT-108-073-300	Axial displacement protection	H 1. Inspecting for defects. 2. Effectiveness test and recording
2.1.10	MT-108-073-000	Overspeed protection	H 1. The same as 2.1.9
2.1.11	MT-108-070-200 MT-108-070-300	Ahead and astern steering gear and main control valve	H 1. Inspecting for connection and defects. 2. Effectiveness test and recording
2.1.12	MT-107-148-000	Main steam pipe between boiler and steam turbine	H 1. Inspecting the internal corrosion of some pipe lengths. 2. Thickness measurement for those suspect pipes and recording, or hydraulic test with 2 times working pressure
2.2	MG-100-000-000	Gas turbine	F 1. General inspection
2.2.1	MG-101-000-000	Rotor, impeller & blades	H 1. Refer to 2.1.2 as appropriate
2.2.2	MG-102-000-000	Casing of air compressor	H 1. Refer to 2.1.1 as appropriate
2.2.3	MG-103-000-000	Combustion chamber	H 1. Inspecting for defects, e.g. crack, corrosion and sooting
2.2.4	MG-104-000-000	Burner	H 1. Inspecting for defects, e.g. crack, corrosion. 2. Inspecting nozzle and fuel injector
2.2.5	MG-105-000-000	Intercooler	H 1. Refer to 2.1.4 as appropriate
2.2.6	MG-106-000-000	Heat exchanger	H 1. Refer to 2.1.6 as appropriate
2.2.7	MG-107-000-000	Starting and reversing devices	H 1. Refer to 2.1.11 as appropriate
3	PM-100-000-000	Shafting	
3.1	PM-101-000-000	Intermediate shaft and bearing	F 1. General visual inspection of shafting and bearing seat for crack and tightening, etc. H 1. Opening the upper cover and inspecting the wear of shaft journal. 2. Measuring and recording eccentric deviation of shaft journal. 3. Inspecting for the tightening of bolts for coupling flange. 4. Inspecting the passage of cooling water pipe. 5. The lower half of bearing not to be dismantled for inspection where the shafting alignment found good
3.2	PM-105-000-000	Thrust shaft and bearing	F 1. Inspecting the bearing shell and oil seal for crack, etc. 2. Inspecting the white metal of thrust pad for wear and loosening. 3. Inspecting the operation of lub. oil system. 4. Inspecting the operation of cooling water. H 1. Measuring and recording the clearance of thrust bearing
4	PM-000-000-000	Propelling system	
4.1	PM-104-000-000	Reduction/increasing gear	F 1. General visual inspection of gear box for leakage, crack and tightening. H 1. Inspecting gear shaft for wear and shaft journal for scotch, measuring and recording eccentric deviation of shaft journal. 2. Inspecting engagement of each gear and pinion for crack of root. 3. Inspecting wear of tooth face and measuring and recording clearance. 4. Inspecting lub. oil system
4.2	PM-103-000-000	Clutch	F 1. Inspecting external condition for leakage and the tightening of hold-down bolts, etc. H 1. Inspecting the items in accordance with the specifications. 2. Effectiveness test
5		Essential auxiliary machinery	
5.1	AS-102-000-000 AS-103-000-000 AS-203-000-000	Main air compressor Auxiliary air compressor Accessory safety device	F 1. General visual inspection for leakage and operation. H 1. Dismantling the cylinder head and inspecting valve hole and water hole. 2. Inspecting cooling water jacket space for scale and corrosion.

PMS No.	CWBT code	Item	Details
			3. Inspecting, measuring the wear of crankshaft journal and bearing and recording. 4. Measuring and recording each grade of cylinder liners. 5. Lub. oil condition, and effectiveness test of safety valve. 6. Opening the end cover of intercooler and inspecting cooling pipeline and sealing condition
5.2	SE-508-000-000	Emergency air compressor and air bottle	F 1. Inspecting the external corrosion. H 1. Effectiveness test of emergency air compressor. 2. Airtightness test of outlet valve and drain valve of emergency small air bottle. 3. Check of safety valve
5.3		Essential pumps and motors	All kinds of pumps are disassembled in accordance with the specifications
5.3.1	BW-102-142-000 BW-102-301-000	Seawater pump & motor for main engine	F 1. General visual inspection of the pump group and flange connection, and the tightening of seat. H 1. Inspecting shaft gland for wear and leakage. 2. Inspecting the impeller for corrosion and dynamical balance. 3. Measuring and recording the clearance between impeller and pump case. 4. Inspecting the wear of blade and tooth face, measuring and recording the clearance. 5. Inspecting the shaft gland for wear. 6. Inspecting the bearing for wear. 7. Effectiveness test after assembly. Key inspection in accordance with different types of pumps: Centrifugal pump: H 1. Inspecting suction pipeline for corrosion and self-priming capability. 2. Inspecting of impeller and blades for cavity corrosion. Gear pump: H 1. Measuring and recording the clearance between gear plane and end cover of pump case. Reciprocating pump: H 1. Inspecting the wear and the opening of piston ring. 2. Measuring and recording the size of pump cylinder. Screw pump: H 1. Watching the noise and stability during operation. 2. Inspecting by-pass safety valve for reliability. Sled (vane) pump: H 1. Measuring and recording the clearance of vane in chute. 2. Measuring and recording the clearance of vane end surface. Inspection of driving motors of various pumps: H 1. Measuring and recording insulance of motors. 2. Replacing the ball bearing or roller bearing and recording as the circumstance dictates and according to overhaul period. 3. Effectiveness test after assembly.
5.3.2	BW-104-142-000 BW-104-301-000	Seawater pump and motor for berthing	
5.3.3	FW-203-000-000	Fresh water pump & motor for main engine	
5.3.4	FW-207-000-000	Fresh water pump & motor for berthing	
5.3.5	TS-605-000-000	Feed pump & motor for boiler	
5.3.6	TS-306-000-000	Circulating water pump & motor for boiler	
5.3.7	TS-404-000-000	Circulating water pump & motor for exhaust boiler	
5.3.8	OS-502-000-000	Fuel pump & motor for boiler	
5.3.9	OS-302-000-000	Fuel pump & motor for main engine	
5.3.10	OS-303-302-000	Fuel pressure pump & motor for main engine	
5.3.11	LO-302-000-000	Lub. oil pump & motor for main engine	
5.3.12	LO-304-000-000	Oil pump & motor for main engine camshaft	
5.3.13	SE-101-000-000	fire pump & motor	
5.3.14	SE-05-01-000-000	Emergency fire pump & driving device	
5.3.15	BW-202-000-000	Ballast pump & motor	
5.3.16	KP-102-142-000 KP-102-301-000	Bilge pump & motor	
5.3.17	BW-203-000-000	Equalizing pump & motor	
5.3.18	BW-204-000-000	General service pump & motor	
5.3.19	FW-402-000-000	Seawater pump and motor for fresh water generator	
5.3.20	FW-405-000-000	Condensate pump and motor for fresh water generator	
5.3.21	OS-102-141-000 OS-102-301-000	Fuel transfer pump and motor	
5.3.22	OS-104-141-000	Diesel oil transfer pump and motor	
5.3.23	KP-104-141-000	Residual fuel pump	

PMS No.	CWBT code	Item	Details
	KP-104-301-000	& motor	
5.3.24	FW-302-000-000	Daily service fresh water pump & motor	
5.3.25	FW-303-000-000	Heat water circulating pump & motor	For various ejector pumps: H 1. Inspecting nozzle holes for wear. 2. Inspecting diffuser cone for erosion and corrosion. 3. Effectiveness test. For the 36 types of pumps and motors mentioned in the left column, general visual inspection is to be carried out every year
5.3.26	BW-402-000-000	Sanitary pump & motor	
5.3.27	FW-502-000-000	Drinking water pump & motor	
5.3.28	FW-205-142-000 FW-205-301-000	Cooling pump & motor of fuel injector for main engine	
5.3.29	FW-204-142-100 FW-204-301-100	Cooling pump & motor of piston for main engine	
5.3.30	FW-302-142-000 FW-302-301-000	Fresh water transfer pump and motor	
5.3.31	FW-403-000-000	Vacuum pump set of fresh water generator	
5.3.32	FW-404-000-000	Salt water pump & motor for fresh water generator	
5.3.33		Vacuum air pump	
5.3.34		Feed water jet pump	
5.3.35	BS-202-146-000	Bilge water jet pump	
5.3.36		All other engine-driven pumps	
5.3.37	DO-202-619-000 DO-202-313-000	Fuel oil separator & motor	H 1. Disassembling oil separator and inspecting each component. 2. Inspecting the vertical spindle for bending and wear. 3. Inspecting bearing for wear and measuring clearance. 4. Inspecting worm wheel and worm for engagement and wear of teeth. 5. Measuring insulance of motor and replacing ball bearing or roller bearing as the circumstance dictates and recording. 6. Effectiveness test after assembly
5.3.38	OS-204-151-000 OS-204-301-000	Diesel oil separator & motor	
5.3.39	LO-202-000-000	Lub. oil separator & motor	
6		Air bottles and various pressure vessels and accessories	
6.1	AS-104-155-000 AS-104-156-000 AS-105-156-000 AS-104-078-000 AS-105-078-000	Main & auxiliary air bottle, working air bottles and accessories such as safety valves	F 1. General visual inspection. H 1. Opening big and small manholes for internal cleaning. 2. Inspecting air bottle for internal corrosion. 3. Inspecting various valves for airtightness. 4. Checking safety valve. 5. Hydraulic test with 1.3 times working pressure for suspect air bottles
6.2	FW-300-000-000 BW-401-147-000 FW-500-000-000	Fresh water pressure tank, sanitary tank (seawater pressure tank) and potable fresh water tank	F 1. General visual inspection. H 1. Opening manholes for internal cleaning. 2. Inspecting internal corrosion, and hydraulic test to be made where necessary. 3. Effectiveness test of automatic control equipment
7	PM-400-000-000	Main & auxiliary steering gear and accessory equipment and control system	F 1. General visual inspection and effectiveness test. H 1. Inspecting each component of the main steering gear for flexibility and reliability of effective actions. 2. Inspecting auxiliary steering gear for flexible and reliable actions. 3. Inspecting whether various conversions of main steering gear are correct and flexible, and whether conversion between main and auxiliary steering gears is quick. 4. Inspecting each equipment of steering control system for flexible and reliable actions. 5. Inspecting feedback device, rudder indicator, etc. for accurate indication. 6. Inspecting whether communication between bridge and steering gear room is in order.

PMS No.	CWBT code	Item	Details
			7. Inspecting whether various alarms of control system are in order. 8. Measuring the insulance of motor, replacing ball bearing or roller bearing as the circumstance dictates and recording. 9. Inspecting the operation of each component of steering gear
8	DO-201-000-000	Windlass	
8.1	DO-201-313-000 DO-201-628-000 DO-201-304-000 DO-201-070-000 DO-201-608-000	Prime motor, driving and control units, operating and braking devices of windlass	F 1. Visual inspection and effectiveness test for windlass. H 1. Inspecting gear, chain sprocket, bearing, brake ribbon (shoe), etc. 2. Inspecting hydraulic cylinder, rotor, blade, bearing, sealing device, etc. 3. Inspecting the tightening of windlass base. 4. Steam windlass: inspecting cylinder, piston, piston ring, crankshaft, bearing, etc. and recording. 5. Inspecting valves, safety valve, etc. on each pipeline. 6. Measuring the insulance of motor and inspect ball bearing or roller bearing
9	KP-101-000-000	Bilge pipe, strainer, bilge well suction, sludge pipe	F 1. Effectiveness test. 2. Visual inspection of bilge well. H 1. Effectiveness test. 2. Inspecting suction screen and mud box for cleanness. 3. Action test of operating valve of emergency bilge suction in engine room
10	BW-201-000-000 BW-205-313-000	Ballast pipe, valve and ballast operating system	F 1. Effectiveness test. H 1. Effectiveness test. 2. Operating test of remote control valve
11	OS-301-150-000 OS-401-150-000 LO-301-150-000 LO-401-150-000 and so on	Pressure strainers, heaters, coolers and various strainers of fuel oil, lub. oil, cooling water, boiler water	H 1. Disassembling, cleaning and inspecting screen, sealing, pipe, etc. 2. Tubular heater or cooler: Opening the cover for internal washing, and external chemical washing of cooler. Inspecting watertight riveting of tube plate of and internal erosion. 3. Plate-type heater or cooler: Opening and scouring clamp plate, and inspecting for corrosion and sealing strips. 4. Visual inspection and effectiveness test after assembly
12	MD-100-000-000	Main engine trial	F 1. Operating test in working condition, including ahead steering, astern steering and reversion tests, and recording main operation parameters of main engine. H 1. Operating test in working condition, including ahead steering, astern steering and reversion tests, and recording operation parameters and thermal parameters of main engine; re-starting test after failure of starting; audible and visual alarm to be given to block the starting function after 3 failures of starting or wrong direction, if fitted
13		Miscellaneous	
13.1	HS-600-000-000	Fuel oil tank separated from hull	H 1. Inspecting internal structure. 2. Inspecting heating pipe. 3. Hydraulic test after overhaul
13.2	SE-102-000-000 SE-103-000-000 SE-104-000-000 SE-200-000-000	Fixed fire - extinguishing system (foam, CO_2, halide and dry powder)	F 1. Inspecting piping, control system, marks and operational instructions. 2. Inspecting ventilation, illumination, communication, instrument, etc. in rooms/stations. 3. Visual inspection of fire-extinguishing agent containers, valves, etc. 4. Measurement of stored quantity of fire-extinguishing agents and passage test of pipeline to be made once two years. 5. Action test of quick-closing valve of oil tank
13.3	HS-400-000-000	Escape route in engine room and boiler room	F 1. Inspecting escape route for unobstructed passage, especially exits not to be locked. 2. Inspecting whether self-closing devices of exit of engine and boiler rooms are effective
13.4	TS-200-172-000	Steam boiler, hot oil heater, pressure vessel, including their safety devices	F 1. Visual inspection. 2. Checking safety valves

PMS No.	CWBT code	Item	Details
14		Additional requirements for oil tankers	
14.1	CG-700-000-000	Cargo oil pump, bilge pump, stripping pump, segregated ballast pump in pump room	F 1. General inspection of cargo oil pump, bilge pump, stripping pump and segregated ballast pump. 2. Inspecting the bases of cargo oil pump, bilge pump, stripping pump and segregated ballast pump, as well as the reliability of gaskets and binding bolts, corrosion of bedplate and condition of locating pins
14.1.1	CG-702-141-000 CG-703-141-000 CG-704-141-000	Cargo oil pump	H 1. Disassembling cargo oil pump and prime motor, inspecting each component for obvious corrosion, deformation, wear, measuring clearance of each component and recording. 2. Inspecting shaft gland for leakage. 3. Aligning the shafting and recording. 4. Functional test of automatic control system and alarm system of prime motor and recording of parameters. 5. Action test of emergency and remote shutdown
14.1.2	CG-702-141-000 CG-703-141-000 CG-704-141-000	Stripping pump	H 1. Disassembling stripping pump and prime motor, inspecting operation of each component, measuring clearance and recording. 2. Inspecting shaft gland for leakage. 3. Action test of emergency and remote shutdown
14.1.3	BW-202-000-000	Segregated ballast pump	H 1. Disassembling segregated ballast pump, inspecting operation of each component, measuring clearance and recording
14.1.4	KP-102-000-000	Bilge pump	H 1. Disassembling bilge pump, inspecting operation of each component, measuring clearance and recording. Action test of emergency and remote shutdown
14.1.5	CG-705-014-000	Sealing device for pump drive assembly	H 1. Disassembling, inspecting and testing sealing device for pump drive assembly penetrating bulkhead
14.1.6	CG-701-000-000	Piping and fittings	H 1. Disassembling, inspecting, hydraulically testing piping and fittings of cargo oil and ballast pumps and recording
14.2	HS-302-000-000	Venting system of cargo oil tank	F 1. General inspection of venting system (including breathing valve) in cargo oil tank and slop tank. H 1. Disassembling and inspecting partial venting pipe in cargo oil tank. 2. Disassembling and inspecting the breathing valve in cargo oil tank, checking pressure and inspecting flame screen. 3. Disassembling and inspecting the quick venting valve in cargo oil tank fitted with IGS, checking pressure and inspecting flame screen
14.3	CG-708-506-000	Crude oil washing machine Washing heater	F 1. Visual inspection of crude oil washing system. 2. Visual inspection for washing heater
14.3.1	CG-708-506-000	Crude oil washing machine	H 1. Disassembling and inspecting crude oil washing machine and action test
14.3.2	CG-708-153-000	Washing heater	H 1. Disassembling washing heater, inspecting tube plate for corrosion, inspecting zinc plate, pipe and hydraulic test. 2. Disassembling, inspecting and testing the safety valve of washing heater, testing automatic temperature control system and automatic level control system. 3. Inspecting the valve or other mechanisms separating the heater from crude oil washing piping
14.4	CG-701-153-000	Cargo oil heating system	H 1. Inspecting cargo oil heating system and accessories (safety valve, reducing valve, automatic pressure regulator valve, regulator, etc. of pipeline). 2. Internal inspection, thickness measurement, hydraulic test of partial cargo oil heating pipe and recording. 3. Inspecting the fixing of heating pipes in cargo oil tank
14.5	CG-706-560-000	Ventilation system of cargo oil pump tank	F 1. General inspection for ventilation system of cargo oil pump tank. H 1. Disassembling and inspecting the ventilator in cargo oil pump tank. 2. Disassembling, inspecting and testing the sealing device of shaft drive assembly for ventilator in cargo oil pump tank that penetrates bulkhead. 3. Emergency shutdown of ventilator and effectiveness test of

PMS No.	CWBT code	Item	Details
			emergency vent. 4. Visual inspection of ventilator and inspecting the fixing of ventilator. 5. Inspecting the interlock of ventilator and illumination of pump room
14.6	CG-708-000-000	Relevant instruments of cargo oil & ballast control stations	F 1. General inspection of cargo oil and ballast control stations and relevant equipment. H 1. Checking relevant instruments of cargo oil and ballast control stations by contrast, e.g.: Steam inlet pressure gauge of steam turbine, tachometer of cargo oil pump, cargo outlet pressure gauge, cargo outlet thermometer, seawater outlet thermometer of washing heater, outlet pressure gauge of ballast pump, hydro-oil outlet pressure gauge of hydraulic pump station, and voltmeter, ammeter and control air pressure gauge of control station. 2. Inspecting the remote control valve and valve position indicator of cargo oil system for hydro-oil leakage and correct indication. 3. Test of high level alarm for pump room bilge. 4. Effectiveness test of alarming for combustible gas concentration
14.7	SE-701-000-000	Inert gas system	
14.7.1	SE-701-000-000	Inert gas system	Inspection of inert gas system (IGS) F 1. General inspection of pipeline and components, serious corrosion, water and oil leakage to be dealt with if found. 2. Action test of remote control, automatic control, soot blower, etc., as far as possible. 3. Alarm test by simulation for key alarming points of IGS. 4. Checking oxygen content meter
14.7.1.1	SE-702-315-000	Monitoring device of inert gas system	H 1. Checking the accuracy of oxygen content meter by Standard N2. 2. Inspecting the operation of audible and visual alarm, main control board and area control board. 3. Checking the parameters of primary alarming points and inspecting safety device for: a. excessive oxygen content in IGS manifold; b. excessively low gas pressure in IGS manifold; c. excessively low feed pressure of deck water seal; d. excessively high gas temperature in IGS manifold; e. excessively low feed pressure of scrubber; f. accuracy of portable oxygen content analyzer; g. interlocking with outlet pressure parameters of cargo oil pump
14.7.1.2	SE-702-307-000	Automatic control for inert gas system	H 1. Inspecting the action and delay time of automatic control regulating valve under different alarm levels and recording. 2. Inspecting the quality performance parameters (set and measured values of outlet pressure of inert gas), reaction sensitivity and accuracy of automatic control for the system
14.7.1.3	SE-701-709-000 SE-701-710-000 SE-701-711-000	Inert gas generator, scrubber, fan, deck water seal	H 1. Disassembling and inspecting inert gas generator, and effectiveness test to be made. 2. Disassembling scrubber and inspecting nozzle, screen, case, protective coating, discharging pipe. 3. Disassembling fan and inspecting impeller, shaft, case, and shaft seal, and test conversion with stand-by fan. 4. Disassembling deck water seal and inspecting internal coating, case, damper, passage of discharging pipe and operation of overboard discharging valve. 5. Disassembling pressure vacuum breaker and inspecting internal corrosion
14.7.1.4	SE-701-142-000	Cooling pump	H 1. Disassembling and inspecting the cooling pump of scrubber, measuring and recording clearance, and test conversion with stand-by pump. 2. Disassembling and inspecting deck water seal, measuring and recording clearance, and test conversion with stand-by pump
15	ES-000-000-000	Electrical	

PMS No.	CWBT code	Item	Details
		installations	
15.1	SE-000-000-000	Emergency equipment	
15.1.1	SE-305-305-000 SE-304-000-000	General alarm system Alarm system for releasing fire-extinguishing agent	F 1. Effectiveness test for inspecting the operation of each switch, button, alarm bell. H 1. Effectiveness test for inspecting the operation of each switch, button, alarm bell. Recording details of test, repair, renewal, etc.
15.1.2	SE-301-000-000	Fire detection & alarm system	F 1. Effectiveness test of fire detection & alarm system in accommodation space & engine room, and of smoke detection system & combustible gas monitoring system (if any) in cargo hold. H 1. Simulation test of fire detection & alarm system; the number of sampled fire detectors to be not less than 5% of the total, including those in boiler space, oil separator space and centralized control room. Recording the test of each space and details of repair, component renewal, etc.
15.1.3	SE-101-166-000	Automatic fire-extinguishing sprinkler system (if fitted)	F 1. Effectiveness test of control system. H 1. Effectiveness test of the system and recording details of repair, component renewal, etc.
15.1.4	SE-507-000-000	Emergency cut-off device for fan and oil pump	F 1. Effectiveness test as practicable as possible. H 1. Effectiveness test of each emergency cut-off device and recording details of test, repair, etc.
15.2	SE-502-000-000	Emergency electric network	
15.2.1	SE-502-000-000	Emergency generating set, emergency storage batteries	F 1. Emergency generating set: Power supply test by manual & automatic (if any) starting and automatic switching on, and recording time of automatic starting & automatic switching on for power supply. Manual starting to be tested three times if a secondary starting source is provided. 2. Emergency storage batteries: discharge test for automatic operation after simulated cutoff of main power source. H 1. Operation test of overhauled or repaired generating set under working load, recording details of overhaul and test. 2. Charging and discharging test of emergency storage batteries in rated condition and recording
15.2.2	SE-504-000-000	Emergency switchboard & emergency battery charging and discharging panel	F 1. Inspecting the working condition under operation. H 1. Measuring the insulance of each branch. 2. Effectiveness test of power distribution and supply, and recording indicated values of each instrument and working conditions. 3. Testing the interlock of main switchboard and shore power switch (if any)
15.2.3	SE-502-325-000	Emergency lighting, temporary emergency lighting, additional emergency lighting (if any)	F 1. Measuring the insulance of each branch. 2. Effectiveness test: Each light is in order with a distinct mark of emergency light
15.3	ES-300-000-000	Main electric network	
15.3.1	ES-101-000-000	Main generator (main engine – driven generating set)	H 1. Operation test of generator under working load and inspection of working condition. 2. Measuring and recording the clearance of rotor and stator of each generator or dismantling, inspecting the bearing and measuring the wear-down. 3. Single and parallel operation test of overhauled or repaired generators under working load, inspecting speed governing of prime motors and load distribution function of generators, and recording the details
15.3.2	ES-300-000-000	Main switchboard and accessories	H 1. Measuring the insulance of each branch. 2. Inspecting the working condition under operation and recording the indicated values of each instrument and working conditions. 3. Testing the interlock of shore power switch and main switch of each generator. 4. Primary instruments to be sent for calibration in accordance

PMS No.	CWBT code	Item	Details
			with the metering requirements
15.3.3	ES-303-000-000 SE-503-000-000	Protective systems of main and emergency power stations	H 1. Checking the overload and delay protection, under-voltage protection, reverse power protection (or reverse current protection), automatic unloading protection, etc. of each motor, recording protective setting and delay time in detail
15.3.4	GD-109-073-000	Safety and protective devices of auxiliary diesel engines	H 1. To test the protective functions such as inlet pressure of lub. oil for diesel engine is overdue low, outlet temperature of cooling fresh water is overdue high, etc. and to record each protective action value in detail
15.4	SE-500-000-000	Distributors, cables & others	
15.4.1	ES-508-000-000	Insulance of power system on board	F 1. Testing and recording the insulance of installations, such as generators, motors. H Measuring and recording the insulance of the following equipment under hot condition: 1. Each generator, motor, main lighting transformer and emergency lighting transformer (if any). 2. Main switchboard, emergency switchboard, emergency battery charging and discharging panel, power distributor. 3. Each power supply branch switch and cable for the items in subparagraph 2 above. 4. Various electrical heaters
15.4.2	ES-504-000-000 to ES-507-000-000	Insulance of lighting system on board	F 1. Testing and recording insulance of each lighting system. H Measuring and recording insulance of the following equipment in hot condition: 1. Each lighting distributor, power supply branch switch and cable. 2. Each navigation light, signal light and explosion-proof light
15.4.3	ES-50X-335-000	Cables	F 1. Inspecting cables for damage. H 1. Renewed and added cables to be in compliance with existing rules and detailed data of cable specifications, current-carrying capacity, etc. to be provided
15.4.4	ES-50X-302-000	Distributor & accessories	F 1. Inspecting whether each distributor is in order. H 1. Inspecting each branch switch, internal wiring, safety earthing, etc. and recording damage and repair
15.4.5	NC-802-374-200 NC-801-374-100	Navigation light, signal light	F 1. Effectiveness test of alarming for navigation light and duplicate supply failures and recording
15.4.6		Motors of essential equipment (see pump units for machinery installations)	F 1. Inspecting each motor in normal working condition. 2. Operational test of steering gear. H 1. Operational test of overhauled or repaired motors in working condition and recording details
15.4.7	NC-300-000-000	Internal communications (telegraph, sound-powered telephone)	F 1. Testing all communications between bridge and engine or centralized control room (including telegraph and sound-powered telephone). 2. Testing communications between bridge and steering gear room
15.4.8	PM-402-301-000 PM-403-301-000 PM-402-302-000 PM-403-302-000 PM-402-304-000 PM-403-304-000 PM-405-000-000 PM-406-331-000	Steering gear (electric) Main & auxiliary motors Main & auxiliary motor controllers Main & auxiliary motor automatic controlling devices Maneuvering part Rudder indicator	F 1. Steering test of main & auxiliary steering gears and recording each parameter (steering time, maximum rudder angle, etc.). 2. Checking rudder indicator by actual rudder angle. 3. Effectiveness test of emergency steering. 4. Effectiveness test of power supply from duplicate sources
15.4.9	RA-502-000-000 RA-404-000-400 TS-104-314-200 TS-204-314-200 TS-304-314-200 RA-406-000-600 RA-405-000-500	Ventilator set Ventilator in cargo hold Ventilator in engine room (including ventilators for auxiliary engine room and oil separator room) Forced ventilation for	F 1. Effectiveness test of each ventilator set. 2. Effectiveness test of emergency shutdown of ventilator sets. H 1. For ventilators having operated for a long time, operational test to be made after dismantling, replacing or repairing the bearing of motor, and maintenance and operational parameters to be recorded

PMS No.	CWBT code	Item	Details
		boiler Ventilator in pump room Ventilator in CO_2 room	
15.5	UA-000-000-000	Survey items to be added for ships having the class notation AUTO-0, MCC or BRC	
15.5.1	UA-100-000-000	Remote control system for main engine	F 1. Control position conversion test for remote control system of main engine. H 1. Testing the functions of emergency stopping button and override button (if any) for main engine on the control console of bridge, such buttons being independent from automatic system. 2. Testing the functions of emergency stopping button and override button (if any) for main engine on the centralized control console of engine room. 3. Testing conversion of control position for main engine between bridge, centralized control room in engine room and control console at engine, and inspecting visual and audible alarm and telegraph function. 4. Testing whether the revolution speed and direction of main engine are kept at the original condition when the power source of remote control system for main engine is interrupted
15.5.2	UA-200-000-000	Automatic control system of power plant	F 1. Effectiveness test of automatic control system of power plant. H 1. Inspecting the standby generating set for starting and being switched on automatically to supply power within the required time in a simulated condition of failure and stopping of the generating set in operation. 2. Inspecting primary pumps serving main and auxiliary engines for starting automatically in sequence after restoring power supply. 3. For two or more generators operating parallel, simulating failure and stopping of one generator, inspecting the actions of automatic unloading device and the standby generator for starting, being switched on and distributing load automatically within the required time, and recording details of such tests
15.5.3	UA-300-000-000	Automatic control system of boiler	F 1. Effectiveness test of automatic control system of boiler. H 1. Testing protective function for automatically stopping the operation of boiler in case of limited low water level, flame failure, excessive steam pressure, etc., inspecting visual and audible alarm and recording test process and data. 2. Testing automatic control procedure of boiler, especially conditions prior to scavenging. 3. Testing function of emergency stopping buttons for boilers in centralized control room
15.5.4	UA-501-000-000	Safety and protective devices of main engine	F 1. Simulating automatic stopping and reduction conditions of main engine and inspecting protective functions of safety system. H 1. Cutting off main power source of safety system, inspecting the system for being capable of automatically converting power source to independent standby storage batteries and giving visual and audible alarm. 2. Simulation test of automatic reduction and stopping functions of main engine in case of excessively low lub. oil inlet pressure, excessively high temperature of cooling water, excessive concentration of oil fog in crankcase, etc., checking the setting of each sensor and recording the details
15.5.5	UA-500-000-000	Alarm system of engine room	F 1. Effectiveness test of alarm system for normal operation of each visual and audible alarm unit. When main alarms are given, e.g. alarms for main engine, generating set, boiler, primary auxiliary machinery, high level of bilge well in engine room and fire in engine room, the failure logging device (if any) is to be capable of printing and recording correctly. H 1. Cutting off main power source of alarm system, inspecting

PMS No.	CWBT code	Item	Details
			the system for being capable of automatically converting power source to independent standby storage batteries and giving visual and audible alarm. 2. Testing at least the following alarm items (simulation test may be made): a. excessively low starting air pressure and failure of third automatic starting of main engine; b. low lub. oil inlet pressure of both main engine and auxiliary engine; c. low water level of boiler; d. power failure, loss of A.C. phase, etc of steering gear; e. high level of bilge well and long operation (or excessively frequent starting) of bilge pump in engine room. 3. Inspecting alarm system for extended alarming function (if any) and automatically starting engineers' alarm in case of no response within the set time, and inspecting engineers' alarm signal for being clearly audible in engineers' accommodation
15.5.6	UA-703-000-000	Condition monitoring system (if any)	F 1. Effectiveness test of condition monitoring equipment. H 1. Baseline data and measurement data of condition monitoring equipment kept on board. 2. Checking measured data of condition monitoring equipment with baseline data to ensure reliability of equipment when overhauling the equipment. 3. Overhaul and maintenance of monitored machinery and electrical installations may be carried out in accordance with the specifications of condition monitoring equipment provided that the condition monitoring techniques are proper and reliable
15.5.7	LO-302-304-000 OS-302-304-000 OS-303-304-000 FW-202-304-100 FW-203-304-000 BW-102-304-000 FW-204-304-000 LO-303-304-000 FW-205-304-000 TS-605-304-000 LO-502-304-000	Automatic switching of main pump sets Lub.oil pump of main engine Fuel pump of main engine Fresh water cooling pump Seawater cooling pump Cooling pump of piston (if provided independently) Cooling pump of fuel injector (if provided independently) Feedwater pump of boiler Fuel pump of boiler, etc.	F 1. Effectiveness test of automatic switching of main pump sets, recording automatic switch setting, adjustment and maintenance of each pump

Appendix 17 S19 EVALUATION OF SCANTLINGS OF THE TRANSVERSE WATERTIGHT CORRUGATED BULKHEAD BETWEEN CARGO HOLDS NOS. 1 AND 2, WITH CARGO HOLD NO. 1 FLOODED, FOR EXISTING BULK CARRIERS

S19.1 Application and definitions

These requirements apply to all bulk carriers of 150 m in length and above, in the foremost hold, intending to carry solid bulk cargoes having a density of 1.78 t/m^3, or above, with single deck, topside tanks and hopper tanks, fitted with vertically corrugated transverse watertight bulkheads between cargo holds Nos.1 and 2 where:

(i) the foremost hold is bounded by the side shell only for ships which were contracted for construction prior to 1 July 1998, and have not been constructed in compliance with IACS Unified Requirement S18;

(ii) the foremost hold is double side skin construction of less than 760 mm breadth measured perpendicular to the side shell in ships, the keels of which were laid, or which were at a similar stage of construction, before 1 July 1999 and have not been constructed in compliance with IACS Unified Requirement S18 (Rev.2, Sept. 2000).

The net scantlings of the transverse bulkhead between cargo holds Nos.1 and 2 are to be calculated using the loads given in S19.2, the bending moment and shear force given in S19.3 and the strength criteria given in S19.4.

Where necessary, steel renewal and/or reinforcements are required as per S19.6.

In these requirements, homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for the two foremost cargo holds, does not exceed 1:20, to be corrected for different cargo densities.

S19.2 Load model

S19.2.1 General

The loads to be considered as acting on the bulkhead are those given by the combination of the cargo loads with those induced by the flooding of cargo hold No.1.

The most severe combinations of cargo induced loads and flooding loads are to be used for the check of the scantlings of the bulkhead, depending on the loading conditions included in the loading manual:

– homogeneous loading conditions;

– non-homogeneous loading conditions.

Non-homogeneous part loading conditions associated with multiport loading and unloading operations for homogeneous loading conditions need not be considered according to these requirements.

S19.2.2 Bulkhead corrugation flooding head

The flooding head h_f (see Figure 1) is the distance, in m, measured vertically with the ship in the upright position, from the calculation point to a level located at a distance d_f, in m, from the baseline equal to:

a) in general: D;

b) for ships less than 50,000 tonnes deadweight with Type B freeboard: 0.95 D. D being the distance, in m, from the baseline to the freeboard deck at side amidship (see Figure 1);

c) for ships to be operated at an assigned load line draught T_r less than the permissible load line draught T, the flooding head defined in a) and b) above may be reduced by $T - T_r$.

S19.2.3 Pressure in the flooded hold

S19.2.3.1 Bulk cargo loaded hold

Two cases are to be considered, depending on the values of d_1 and d_f, d_1 (see Figure 1) being a distance from the baseline given, in m, by:

$$d_1 = \frac{M_c}{\rho_c \cdot l_c \cdot B} + \frac{V_{LS}}{l_c \cdot B} + \left(h_{HT} - h_{DB}\right) \cdot \frac{b_{HT}}{B} + h_{DB}$$

Notes:

1 Changes introduced in Revision 2 to UR S19, i.e. the introduction of the first sentence of S19.6 as well as the Annex are to be applied not later than 1 July 1998.

2 Annex 2 contains, for guidance only, a flow chart entitled “Guidance to Assess Capability of Carriage of High Density Cargoes on Existing Bulk Carriers according to the Strength of Transverse Bulkhead between Cargo Holds Nos.1 and 2”.

3 Changes introduced in Rev.4 are to be uniformly implemented from 1 July 2001.

where: M_c – mass of cargo, in tonnes, in hold No.1;
ρ_c – bulk cargo density, in t/m^3;
l_c – length of hold No.1, in m;
B – ship's breadth amidship, in m;
V_{LS} – volume, in m^3, of the bottom stool above the inner bottom;
h_{HT} – height of the hopper tanks amidship, in m, from the baseline;
h_{DB} – height of the double bottom, in m;
b_{HT} – breadth of the hopper tanks amidship, in m.

a) $d_f \geq d_1$

At each point of the bulkhead located at a distance between d_1 and d_f from the baseline, the pressure $p_{c,f}$, in kN/m^2, is given by:

$$P_{c,f} = \rho \cdot g \cdot h_f$$

where: ρ – seawater density, in t/m^3;
g – 9.81 m/s^2, gravity acceleration;
h_f – flooding head as defined in S19.2.2.

At each point of the bulkhead located at a distance lower than d_1 from the baseline, the pressure $p_{c,f}$, in kN/m^2, is given by:

$$P_{c,f} = \rho \cdot g \cdot h_f + [\rho_c - \rho \cdot (1 - perm)] \cdot g \cdot h_1 \cdot \tan^2\gamma$$

where: ρ, g, h_f – as given above;
ρ_c – bulk cargo density, in t/m^3;
$perm$ – permeability of cargo, to be taken as 0.3 for ore (corresponding bulk cargo density for iron ore may generally be taken as 3.0 t/m^3);
h_1 – vertical distance, in m, from the calculation point to a level located at a distance d1, as defined above, from the base line (see Figure 1);
γ – 45° – (φ/2)
φ – angle of repose of the cargo, in degrees, and may generally be taken as 35° for iron ore.

The force $F_{c,f}$, in kN, acting on a corrugation is given by:

$$F_{c,f} = s_1 \cdot \left[\rho \cdot g \cdot \frac{(d_f - d_1)^2}{2} + \frac{\rho \cdot g \cdot (d_f - d_1) + (p_{c,f})_{le}}{2} \cdot (d_1 - h_{DB} - h_{LS}) \right]$$

where: s_1 – spacing of corrugations, in m (see Figure 2a);
ρ, g, d_1, h_{DB} – as given above;
d_f – as given in S19.2.2;
$(p_{c,f})_{le}$ – pressure, in kN/m^2, at the lower end of the corrugation;
h_{LS} – height of the lower stool, in m, from the inner bottom.

b) $d_f < d_1$

At each point of the bulkhead located at a distance between d_f and d_1 from the baseline, the pressure $p_{c,f}$, in kN/m^2, is given by:

$$p_{c,f} = \rho_c \cdot g \cdot h_1 \cdot \tan^2\gamma$$

where: ρ_c, g, h_1, γ – as given in a) above.

At each point of the bulkhead located at a distance lower than d_f from the baseline, the pressure $P_{c,f}$, in kN/m^2, is given by:

$$P_{c,f} = \rho \cdot g \cdot h_f + [\rho_c \cdot h_1 - \rho \cdot (1 - perm) \cdot h_f] \cdot g \cdot \tan^2\gamma$$

where: ρ, g, h_f, ρ_c, h_1, $perm$, γ = as given in a) above.

The force $F_{c,f}$, in kN, acting on a corrugation is given by:

$$F_{c,f} = s_1 \cdot \left[\rho_c \cdot g \cdot \frac{(d_1 - d_f)^2}{2} \cdot \tan^2\gamma + \frac{\rho_c \cdot g \cdot (d_1 - d_f) \cdot \tan^2\gamma + (p_{c,f})_{le}}{2} \cdot (d_f - h_{DB} - h_{LS}) \right]$$

where: s_1, ρ_c, g, γ, $(p_{c,f})_{le}$, h_{LS} – as given in a) above;
d_1, h_{DB} – as given in S19.2.3.1;
d_f – as given in S19.2.2.

S19.2.3.2 Empty hold

At each point of the bulkhead, the hydrostatic pressure p_f induced by the flooding head h_f is to be considered.

The force F_f, in kN, acting on a corrugation is given by:

$$F_f = s_1 \cdot \rho \cdot g \cdot \frac{(d_f - h_{DB} - h_{LS})^2}{2}$$

where: s_1, ρ, g, h_{LS} – as given in S19.2.3.1 a);
h_{DB} – as given in S19.2.3.1;
d_f – as given in S19.2.2.

S19.2.4 Pressure in the non-flooded bulk cargo loaded hold

At each point of the bulkhead, the pressure P_c, in kN/m^2, is given by:

$$p_c = \rho_c \cdot g \cdot h_1 \cdot \tan^2 \gamma$$

where: ρ_c, g, h_1, γ – as given in S19.2.3.1 a).

The force F_c, in kN, acting on a corrugation is given by:

$$F_c = \rho_c \cdot g \cdot s_1 \cdot \frac{(d_1 - h_{DB} - h_{LS})^2}{2} \cdot \tan^2 \gamma$$

where: ρ_c, g, s_1, h_{LS}, γ – as given in S19.2.3.1 a);
d_1, h_{DB} – as given in S19.2.3.1.

S19.2.5 Resultant pressure

S19.2.5.1 Homogeneous loading conditions

At each point of the bulkhead structures, the resultant pressure p, in kN/m^2, to be considered for the scantlings of the bulkhead is given by:

$$p = p_{c,f} - 0.8 \cdot p_c$$

The resultant force F, in kN, acting on a corrugation is given by:

$$F = F_{c,f} - 0.8 \cdot F_c$$

S19.2.5.2 Non homogeneous loading conditions

At each point of the bulkhead structures, the resultant pressure p, in kN/m^2, to be considered for the scantlings of the bulkhead is given by:

$$p = p_{c,f}$$

The resultant force F, in kN, acting on a corrugation is given by:

$$F = F_{c,f}$$

In case hold No.1, in non homogeneous loading conditions, is not allowed to be loaded, the resultant pressure p, in kN/m^2, to be considered for the scantlings of the bulkhead is given by:

$$p = p_f$$

and the resultant force F, in kN, acting on a corrugation is given by:

$$F = F_f$$

S19.3 Bending moment and shear force in the bulkhead corrugations

The bending moment M and the shear force Q in the bulkhead corrugations are obtained using the formulae given in S19.3.1 and S19.3.2. The M and Q values are to be used for the checks in S19.4.

S19.3.1 Bending moment

The design bending moment M, in kN·m, for the bulkhead corrugations is given by:

$$M = \frac{F \cdot l}{8}$$

where: F – resultant force, in kN, as given in S19.2.5;
l – span of the corrugation, in m, to be taken according to Figures 2a and 2b.

S19.3.2 Shear force

The shear force Q, in kN, at the lower end of the bulkhead corrugations is given by:

$$Q = 0.8F$$

where: F – as given in S19.2.5.

S19.4 Strength criteria

S19.4.1 General

The following criteria are applicable to transverse bulkheads with vertical corrugations (see Figure 2a).

Requirements for local net plate thickness are given in S19.4.7.

In addition, criteria given in S19.4.2 and S19.4.5 are to be complied with.

Where the corrugation angle φ shown in Figure 2a is less than 50°, an horizontal row of staggered shedder plates is to be fitted at approximately mid depth of the corrugations (see Figure 2a) to help preserve dimensional stability of the bulkhead under flooding loads. The shedder plates are to be welded to the corrugations by double continuous welding, but they are not to be welded to the side shell.

The thicknesses of the lower part of corrugations considered in the application of S19.4.2 and S19.4.3 are to be maintained for a distance from the inner bottom (if no lower stool is fitted) or the top of the lower stool not less than 0.15 l.

The thicknesses of the middle part of corrugations considered in the application of S19.4.2 and S19.4.4 are to be maintained to a distance from the deck (if no upper stool is fitted) or the bottom of the upper stool not greater than 0.3 l.

S19.4.2 Bending capacity and shear stress τ

The bending capacity is to comply with the following relationship:

$$10^3 \cdot \frac{M}{0.5 \cdot Z_{le} \cdot \sigma_{a,le} + Z_m \cdot \sigma_{a,m}} \leq 1.0$$

where: M – bending moment, in kN·m, as given in S19.3.1;

Z_{le} – section modulus of one half pitch corrugation, in cm^3, at the lower end of corrugations, to be calculated according to S19.4.3;

Z_m – section modulus of one half pitch corrugation, in cm^3, at the mid-span of corrugations, to be calculated according to S19.4.4;

$\sigma_{a,\,le}$ – allowable stress, in N/mm^2, as given in S19.4.5, for the lower end of corrugations;

$\sigma_{a,\,m}$ – allowable stress, in N/mm^2, as given in S19.4.5, for the mid-span of corrugations.

In no case Z_m is to be taken greater than the lesser of 1.15 Z_{le} and 1.15 Z'_{le} for calculation of the bending capacity, Z'_{le} being defined below.

In case effective shedder plates are fitted which:

– are not knuckled;

– are welded to the corrugations and the top of the lower stool by one side penetration welds or equivalent;

– are fitted with a minimum slope of 45° and their lower edge is in line with the stool side plating;

or effective gusset plates are fitted which:

– are fitted in line with the stool side plating;

– have material properties at least equal to those provided for the flanges.

The section modulus Z_{le}, in cm^3, is to be taken not larger than the value Z'_{le}, in cm^3, given by:

$$Z'_{le} = Z_g + 10^3 \cdot \frac{Q - h_g - 0.5 h_g^2 \cdot s_1 \cdot p_g}{\sigma_a}$$

where: Z_g – section modulus of one half pitch corrugation, in cm^3, according to S19.4.4, in way of the upper end of shedder or gusset plates, as applicable;

Q – shear force, in kN, as given in S19.3.2;

h_g – height, in m, of shedder or gusset plates, as applicable (see Figures 3a, 3b, 4a and 4b);

s_1 – as given in S19.2.3.1 a);

P_g – resultant pressure, in kN/m^2, as defined in S19.2.5, calculated in way of the middle of the shedder or gusset plates, as applicable;

σ_a – allowable stress, in N/mm^2, as given in S19.4.5.

Stresses τ are obtained by dividing the shear force Q by the shear area. The shear area is to be reduced in order to account for possible non-perpendicularity between the corrugation webs and flanges. In general, the reduced shear area may be obtained by multiplying the web sectional area by sin φ, φ being the angle between the web and the flange.

When calculating the section moduli and the shear area, the net plate thicknesses are to be used.

The section moduli of corrugations are to be calculated on the basis of the requirements given in S19.4.3 and S19.4.4.

S19.4.3 Section modulus at the lower end of corrugations

The section modulus is to be calculated with the compression flange having an effective flange width, b_{ef}, not larger than as given in S19.4.6.1.

If the corrugation webs are not supported by local brackets below the stool top (or below the inner bottom) in the lower part, the section modulus of the corrugations is to be calculated considering the corrugation webs 30% effective.

a) Provided that effective shedder plates, as defined in S19.4.2, are fitted (see Figures 3a and 3b), when calculating the section modulus of corrugations at the lower end (cross-section ① in Figures 3a and 3b), the

area of flange plates, in cm^2, may be increased by:

$$2.5 \cdot a \cdot \sqrt{t_f \cdot t_{sh}} \cdot \sqrt{\frac{\sigma_{Fsh}}{\sigma_{Ffl}}}$$

(not to be taken greater than 2.5 $a \cdot t_f$)

where: a – width, in m, of the corrugation flange (see Figure 2a);
t_{sh} – net shedder plate thickness, in mm;
t_f – net flange thickness, in mm;
σ_{Fsh} – minimum upper yield stress, in N/mm^2, of the material used for the shedder plates;
σ_{Ffl} – minimum upper yield stress, in N/mm^2, of the material used for the corrugation flanges.

b) Provided that effective gusset plates, as defined in S19.4.2, are fitted (see Figures 4a and 4b), when calculating the section modulus of corrugations at the lower end (cross-section ① in Figures 4a and 4b), the area of flange plates, in cm^2, may be increased by $7h_g t_{gu}$) where: h_g = height of gusset plate in m, see Figures 4a and 4b, not to be taken greater than:

$$\frac{10}{7} \cdot s_{gu}$$

where: s_{gu} – width of the gusset plates, in m;
t_{gu} – net gusset plate thickness, in mm, not to be taken greater than t_f;
t_f – net flange thickness, in mm, based on the as-built condition.

c) If the corrugation webs are welded to a sloping stool top plate, which is at an angle not less than 45º with the horizontal plane, the section modulus of the corrugations may be calculated considering the corrugation webs fully effective. In case effective gusset plates are fitted, when calculating the section modulus of corrugations the area of flange plates may be increased as specified in b) above. No credit can be given to shedder plates only.

For angles less than 45º, the effectiveness of the web may be obtained by linear interpolation between 30% for 0º and 100% for 45º.

S19.4.4 Section modulus of corrugations at cross sections other than the lower end

The section modulus is to be calculated with the corrugation webs considered effective and the compression flange having an effective flange width, b_{ef}, not larger than as given in S19.4.6.1.

S19.4.5 Allowable stress check

The normal and shear stresses σ and τ are not to exceed the allowable values σ_a and τ_a, in N/mm^2, given by:

$$\sigma_a = \sigma_F$$
$$\tau_a = 0.5\,\sigma_F$$

where: b_F – minimum upper yield stress, in N/mm^2, of the material.

S19.4.6 Effective compression flange width and shear buckling check

S19.4.6.1 Effective width of the compression flange of corrugations

The effective width b_{ef}, in m, of the corrugation flange is given by:

$$b_{ef} = C_e \cdot a$$

where:

$$C_e = \frac{2.25}{\beta} - \frac{1.25}{\beta^2} \quad \text{for} \quad \beta > 1.25;$$

$$C_e = 1.0 \quad \text{for} \quad \beta \le 1.25;$$

$$\beta = 10^3 \cdot \frac{a}{t_f} \cdot \sqrt{\frac{\sigma_F}{E}};$$

t_f – net flange thickness, in mm;
a – width, in m, of the corrugation flange (see Figure 2a);
σ_F – minimum upper yield stress, in N/mm^2, of the material;
E – modulus of elasticity, in N/mm^2, to be assumed equal to 2.06×10^5 for steel.

S19.4.6.2 Shear

The buckling check is to be performed for the web plates at the corrugation ends.

The shear stress τ is not to exceed the critical value τ_c, in N/mm^2, obtained by the following:

$$\tau_C = \tau_E \qquad \text{when} \quad \tau_E \le \frac{\tau_F}{2}$$

$$\tau_C = \tau_F\left(1-\frac{\tau_F}{4\tau_E}\right) \qquad \text{when} \quad \tau_E \rangle \frac{\tau_F}{2}$$

$$\tau_F = \frac{\sigma_F}{\sqrt{3}}$$

where: τ_F – minimum upper yield stress, in N/mm^2, of the material;

$$\tau_E = 0.9k_t E\left(\frac{t}{1000c}\right)^2 \quad \text{N/mm}^2$$

where: k_t = 6.34

E – modulus of elasticity of material as given in S19.4.6.1;

t – net thickness, in mm, of corrugation web;

c – width, in m, of corrugation web (See Figure 2a).

S19.4.7 Local net plate thickness

The bulkhead local net plate thickness t, in mm, is given by:

$$t = 14.9 \cdot s_w \cdot \sqrt{\frac{p}{\sigma_F}}$$

where: s_w – plate width, in m, to be taken equal to the width of the corrugation flange or web, whichever is the greater (see Figure 2a);

p – resultant pressure, in kN/m^2, as defined in S19.2.5, at the bottom of each strake of plating; in all cases, the net thickness of the lowest strake is to be determined using the resultant pressure at the top of the lower stool, or at the inner bottom, if no lower stool is fitted or at the top of shedders, if shedder or gusset/shedder plates are fitted;

σ_F – minimum upper yield stress, in N/mm^2, of the material.

For built-up corrugation bulkheads, when the thicknesses of the flange and web are different, the net thickness of the narrower plating is to be not less than t_n, in mm, given by:

$$t_n = 14.9 \cdot s_n \cdot \sqrt{\frac{p}{\sigma_F}}$$

where: s_n – width, in m, of the narrower plating.

The net thickness of the wider plating, in mm, is not to be taken less than the maximum of the following values:

$$t_w = 14.9 \cdot s_w \cdot \sqrt{\frac{p}{\sigma_F}}$$

$$t_w = \sqrt{\frac{440 \cdot s_w^2 \cdot p}{\sigma_F} - t_{np}^2}$$

where: $t_{np} \leq$ actual net thickness of the narrower plating and not to be greater than:

$$14.9 \cdot s_w \cdot \sqrt{\frac{p}{\sigma_F}}$$

S19.5 Local details

As applicable, the design of local details is to comply with the Society's requirements for the purpose of transferring the corrugated bulkhead forces and moments to the boundary structures, in particular to the double bottom and cross-deck structures.

In particular, the thickness and stiffening of gusset and shedder plates, installed for strengthening purposes, is to comply with the Society's requirements, on the basis of the load model in S19.2.

Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the Society's requirements.

S19.6 Corrosion addition and steel renewal

Renewal/reinforcement shall be done in accordance with the following requirements and the guidelines contained in the Annex.

a) Steel renewal is required where the gauged thickness is less than t_{net} + 0.5 mm, t_{net} being the thickness used for the calculation of bending capacity and shear stresses as given in S19.4.2. Or the local net plate

thickness as given in S19.4.7. Alternatively, reinforcing doubling strips may be used providing the net thickness is not dictated by shear strength requirements for web plates (see S19.4.5 and S19.4.6.2) or by local pressure requirements for web and flange plates (see S19.4.7).

Where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

b) Where steel renewal or reinforcement is required, a minimum thickness of t_{net} + 2.5 mm is to be replenished for the renewed or reinforced parts.

c) When:

$$0.8 \cdot (\sigma_{Ffl} \cdot t_{fl}) \geq \sigma_{Fs} \cdot t_{st}$$

where:

σ_{Ffl} – minimum upper yield stress, in N/mm^2, of the material used for the corrugation flanges;

σ_{Fs} – minimum upper yield stress, in N/mm^2, of the material used for the lower stool side plating or floors (if no stool is fitted);

t_{fl} – flange thickness, in mm, which is found to be acceptable on the basis of the criteria specified in a) above or, when steel renewal is required, the replenished thickness according to the criteria specified in b) above. The above flange thickness dictated by local pressure requirements (see S19.4.7) need not be considered for this purpose;

t_{st} – as-built thickness, in mm, of the lower stool side plating or floors (if no stool is fitted),

gussets with shedder plates, extending from the lower end of corrugations up to 0.1l, or reinforcing doubling strips (on bulkhead corrugations and stool side plating) are to be fitted.

If gusset plates are fitted, the material of such gusset plates is to be the same as that of the corrugation flanges. The gusset plates are to be connected to the lower stool shelf plate or inner bottom (if no lower stool is fitted) by deep penetration welds (see Figure 5).

d) Where steel renewal is required, the bulkhead connections to the lower stool shelf plate or inner bottom (if no stool is fitted) are to be at least made by deep penetration welds (see Figure 5).

e) Where gusset plates are to be fitted or renewed, their connections with the corrugations and the lower stool shelf plate or inner bottom (if no stool is fitted) are to be at least made by deep penetration welds (see Figure 5).

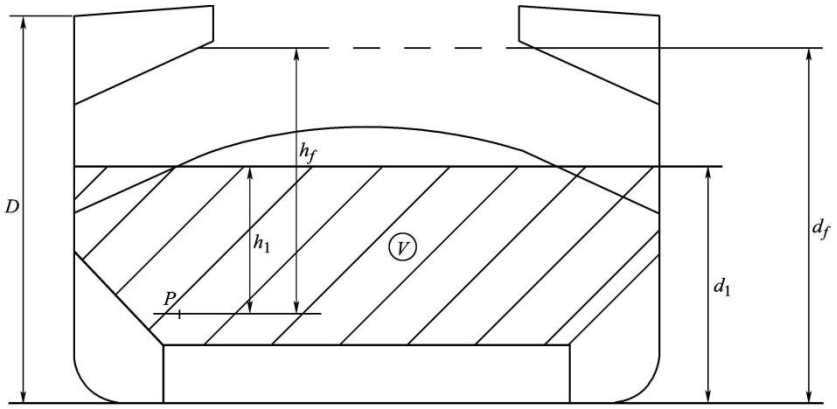

Figure 1

V – Volume of cargo; *P* – Calculation point

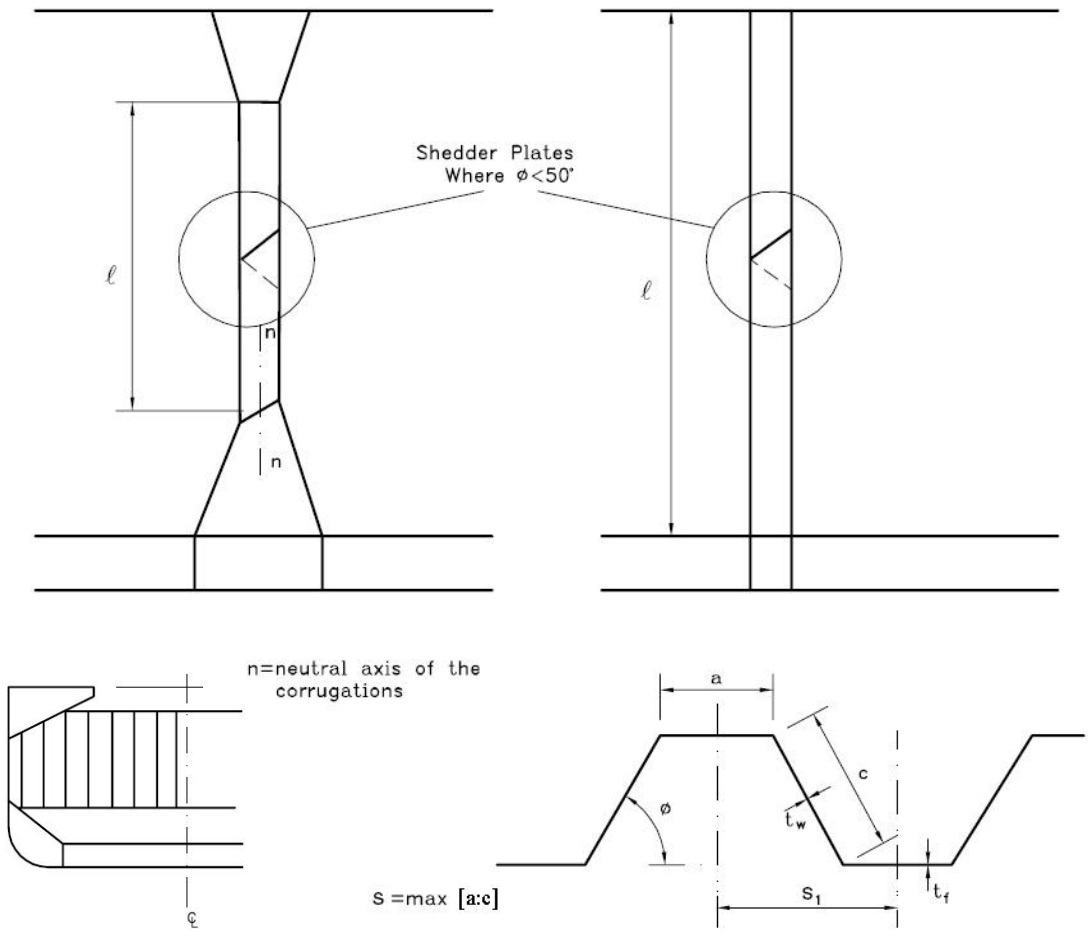

Figure 2a

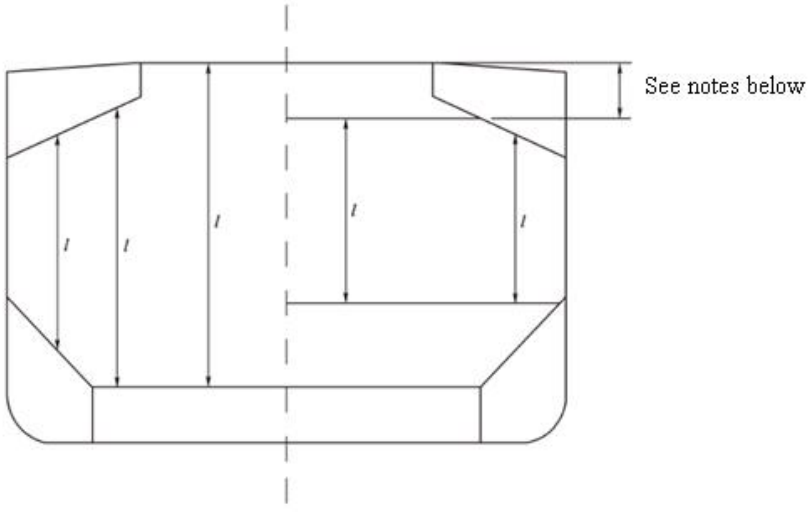

Notes: For the definition of *l*, the internal end of the upper stool is not to be taken more than a distance from the deck at the centre line equal to:

– 3 times the depth of corrugations, in general;

– 2 times the depth of corrugations, for rectangular stool.

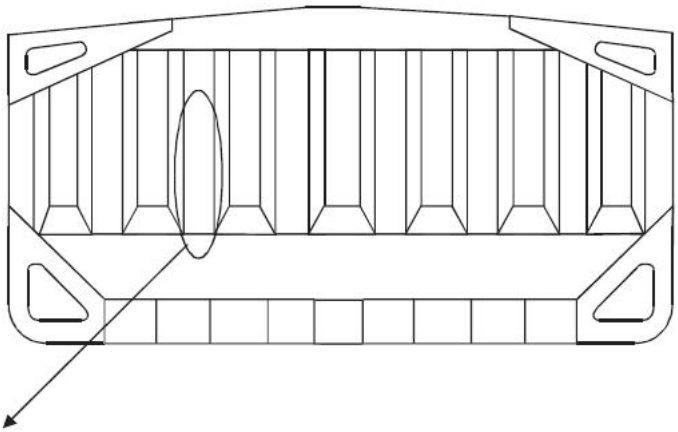
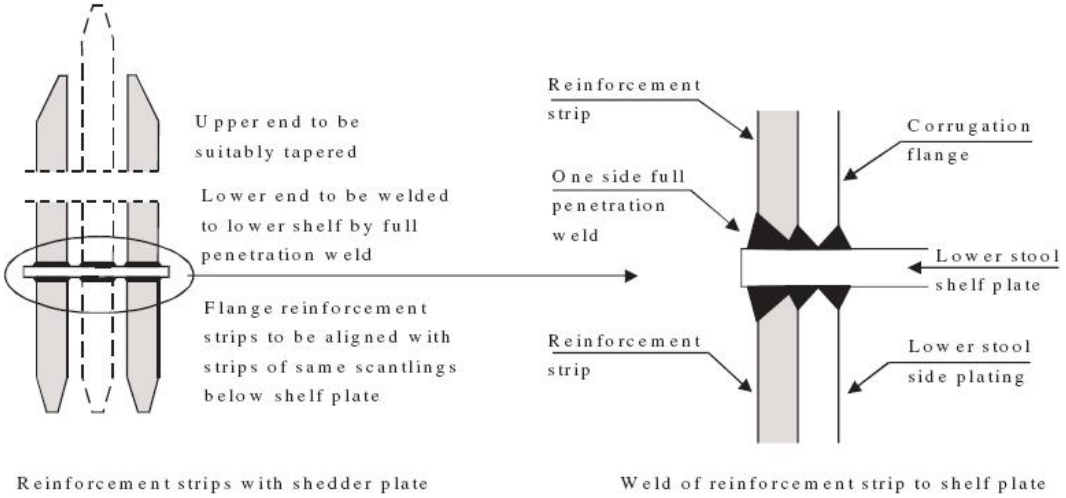
Annex 1
Guidance on Renewal/Reinforcement of Vertically Corrugated Transverse Watertight Bulkhead between Cargo Holds Nos.1 and 2

1. The need for renewal or reinforcement of the vertically corrugated transverse watertight bulkhead between cargo holds Nos.1 and 2 will be determined by the classification society on a case by case basis using the criteria given in S19 in association with the most recent gaugings and findings from survey.
2. In addition to class requirements, the S19 assessment of the transverse corrugated bulkhead will take into account the following:
   a. Scantlings of individual vertical corrugations will be assessed for reinforcement/renewal based on thickness measurements obtained in accordance with Annex III to UR Z10.2 at their lower end, at mid-depth and in way of plate thickness changes in the lower 70%. These considerations will take into account the provision of gusset and shedder plates and the benefits they offer, provided that they comply with S19.4.2 and S19.6.
   b. Taking into account the scantlings and arrangements for each case, permissible levels of diminution will be determined and appropriate measures taken in accordance with S19.6.
3. Where renewal is required, the extent of renewal is to be shown clearly in plans. The vertical distance of each renewal zone is to be determined by considering S19 and in general is to be not less than 15% of the vertical distance between the upper and lower end of the corrugation – measured at the ship's centreline.
4. Where the reinforcement is accepted by adding strips, the length of the reinforcing strips is to be sufficient to allow it to extend over the whole depth of the diminished plating. In general, the width and thickness of strips should be sufficient to comply with the S19 requirements. The material of the strips is to be the same as that of the corrugation plating. The strips are to be attached to the existing bulkhead plating by continuous fillet welds. The strips are to be suitably tapered or connected at ends in accordance with Class Society practice.
5. Where reinforcing strips are connected to the inner bottom or lower stool shelf plates, one side full penetration welding is to be used. When reinforcing strips are fitted to the corrugation flange and are connected to the lower stool shelf plate, they are normally to be aligned with strips of the same scantlings welded to the stool side plating and having a minimum length equal to the breadth of the corrugation flange.
6. Figure 1 gives a general arrangement of structural reinforcement.

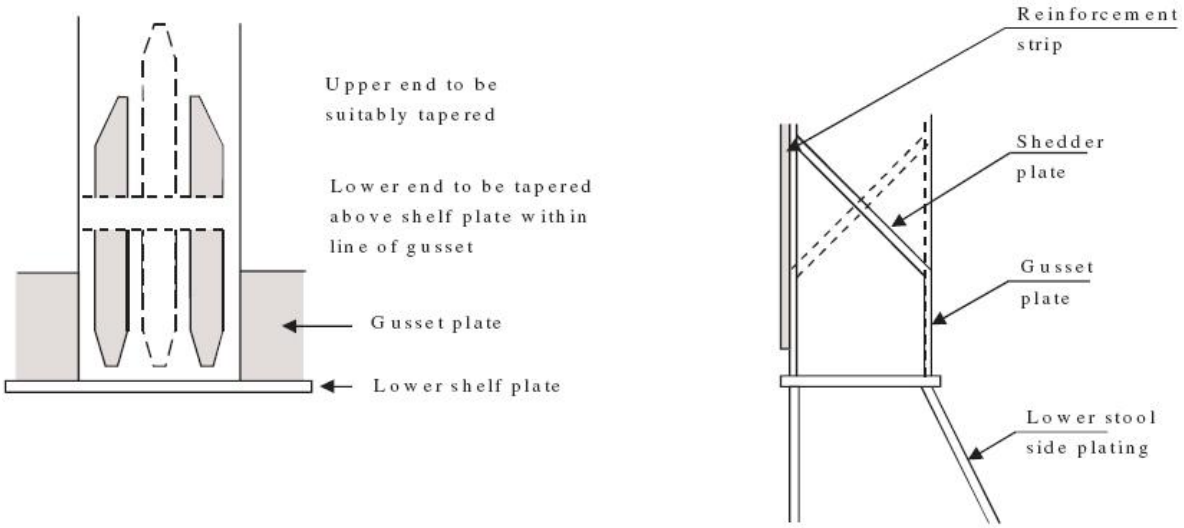
Notes to Figure 1 on reinforcement:
1. Square or trapezoidal corrugations are to be reinforced with plate strips fitted to each corrugation flange sufficient to meet the requirements of S19.
2. The number of strips fitted to each corrugation flange is to be sufficient to meet the requirements of S19.
3. The shedder plate may be fitted in one piece or prefabricated with a welded knuckle (gusset plate).
4. Gusset plates, where fitted, are to be welded to the shelf plate in line with the flange of the corrugation, to reduce the stress concentrations at the corrugation corners. Ensure good alignment between gusset plate, corrugation flange and lower stool sloping plate. Use deep penetration welding at all connections. Ensure start and stop of welding is as far away as practically possible from corners of corrugation.
5. Shedder plates are to be attached by one side full penetration welds onto backing bars.
6. Shedder and gusset plates are to have a thickness equal to or greater than the original bulkhead thickness. Gusset plate is to have a minimum height (on the vertical part) equal to half of the width of the corrugation flange. Shedders and gussets are to be same material as flange material.





Reinforcement strips with shedder plate

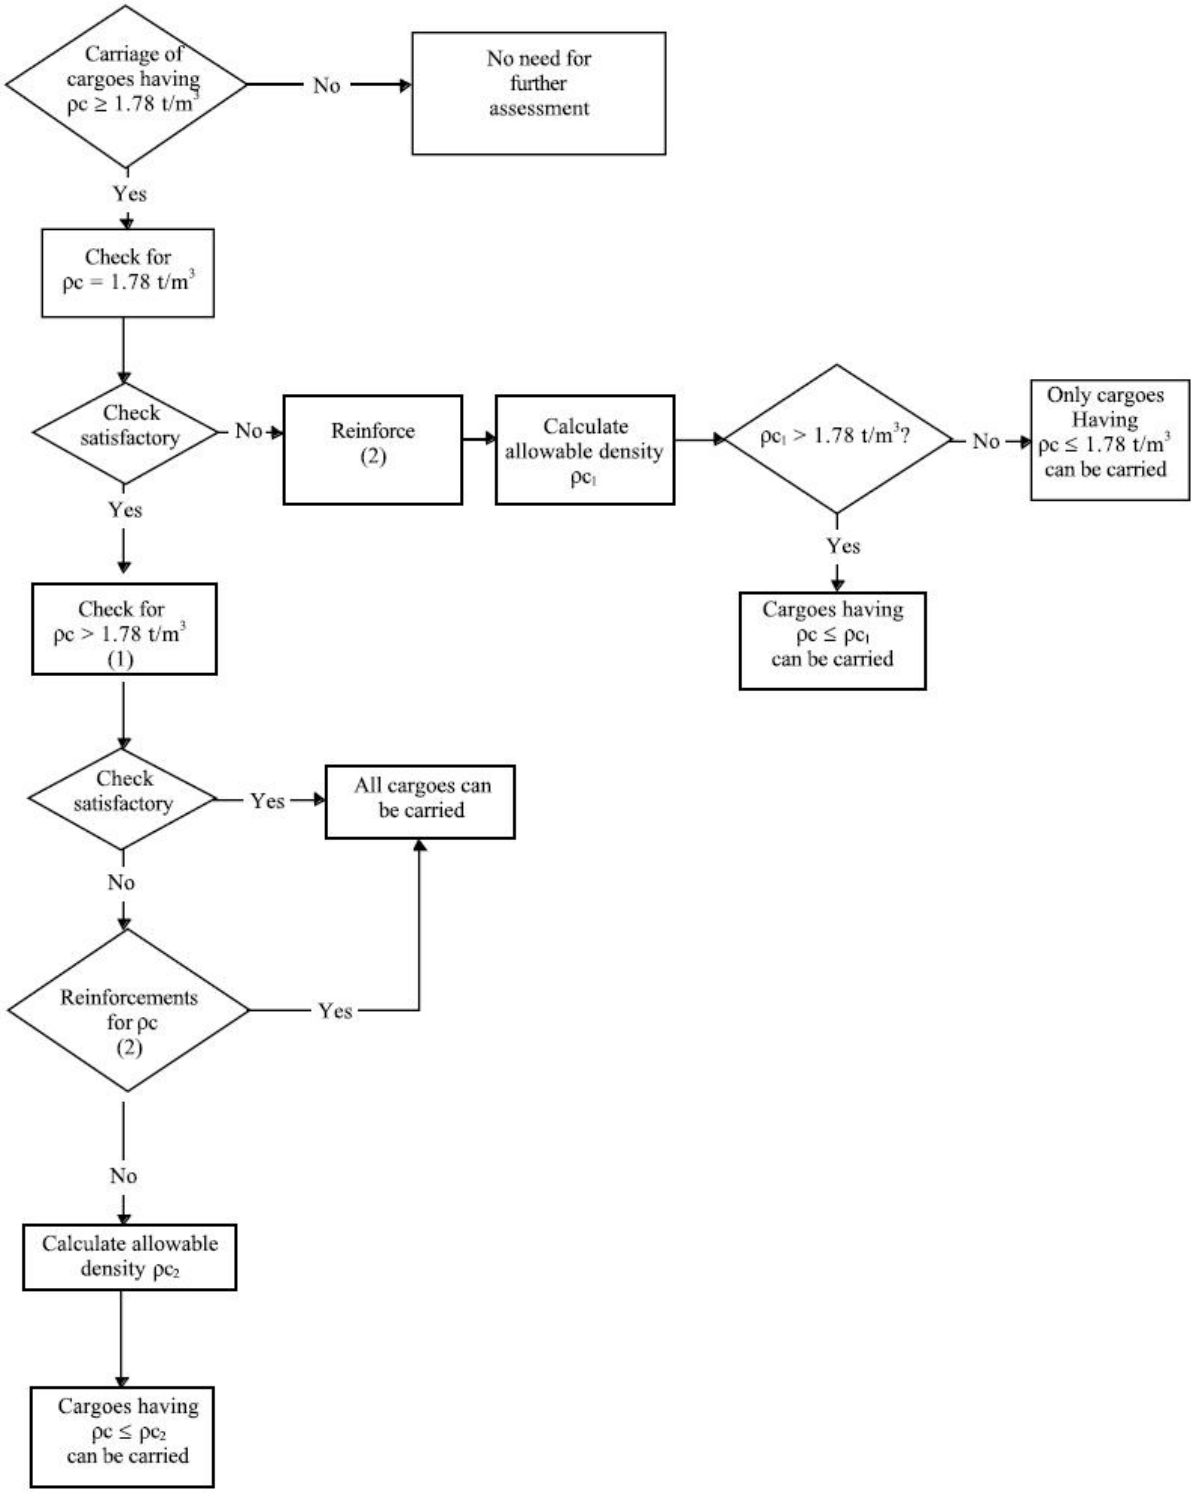
Weld of reinforcement strip to shelf plate



Reinforcement strips with shedder and gusset plates

Figure 1

Annex 2
Guidance to Assess Capability of Carriage of High Density Cargoes on Existing Bulk Carriers according to the Strength of Transverse Bulkhead between Cargo Holds Nos.1 and 2



Note:

(1) ρ_c typical of cargoes to be carried; in any case a value of 3 t/m^3, corresponding to ore cargo, is to be considered.

(2) In deciding the reinforcement needed, consideration will be given to the effects of restricting the cargo distribution (homogeneous loading condition or reduction in the ship deadweight).

Appendix 18 S22 EVALUATION OF ALLOWABLE HOLD LOADING OF CARGO HOLD NO.1 WITH CARGO HOLD NO.1 FLOODED, FOR EXISTING BULK CARRIERS

S22.1 Application and definitions

These requirements apply to all bulk carriers of 150 m in length and above, in the foremost hold, intending to carry solid bulk cargoes having a density of 1.78 t/m^3, or above, with single deck, topside tanks and hopper tanks, where:

(i) the foremost hold is bounded by the side shell only for ships which were contracted for construction prior to 1 July 1998, and have not been constructed in compliance with IACS Unified Requirement S20;

(ii) the foremost hold is double side skin construction less than 760 mm breadth measured perpendicular to the side shell in ships, the keels of which were laid, or which were at a similar stage of construction, before 1 July 1999 and have not been constructed in compliance with IACS Unified Requirement S20 (Rev.2, Sept. 2000).

Early completion of a special survey coming due after 1 July 1998 to postpone compliance is not allowed.

The loading in cargo hold No.1 is not to exceed the allowable hold loading in the flooded condition, calculated as per S22.4, using the loads given in S22.2 and the shear capacity of the double bottom given in S22.3.

In no case, the allowable hold loading in flooding condition is to be taken greater than the design hold loading in intact condition.

S22.2 Load model

S22.2.1 General

The loads to be considered as acting on the double bottom of hold No.1 are those given by the external sea pressures and the combination of the cargo loads with those induced by the flooding of hold No.1.

The most severe combinations of cargo induced loads and flooding loads are to be used, depending on the loading conditions included in the loading manual:

– homogeneous loading conditions;

– non-homogeneous loading conditions;

– packed cargo conditions (such as steel mill products).

For each loading condition, the maximum bulk cargo density to be carried is to be considered in calculating the allowable hold limit.

S22.2.2 Inner bottom flooding head

The flooding head h_f (see Figure 1) is the distance, in m, measured vertically with the ship in the upright position, from the inner bottom to a level located at a distance d_f, in m, from the baseline equal to:

– D in general;

– 0.95 D for ships less than 50,000 tonnes deadweight with Type B freeboard.

D being the distance, in m, from the baseline to the freeboard deck at side amidship (see Figure 1).

S22.3 Shear capacity of the double bottom of hold No.1

The shear capacity C of the double bottom of hold No.1 is defined as the sum of the shear strength at each end of:

– all floors adjacent to both hoppers, less one half of the strength of the two floors adjacent to each stool, or transverse bulkhead if no stool is fitted (see Figure 2);

– all double bottom girders adjacent to both stools, or transverse bulkheads if no stool is fitted.

The strength of girders or floors which run out and are not directly attached to the boundary stool or hopper girder is to be evaluated for the one end only.

Note that the floors and girders to be considered are those inside the hold boundaries formed by the hoppers and stools (or transverse bulkheads if no stool is fitted). The hopper side girders and the floors directly below the connection of the bulkhead stools (or transverse bulkheads if no stool is fitted) to the inner bottom are not to be included.

When the geometry and/or the structural arrangement of the double bottom are such to make the above assumptions inadequate, to the Society's discretion, the shear capacity C of the double bottom is to be calculated according to the Society's criteria.

In calculating the shear strength, the net thicknesses of floors and girders are to be used. The net thickness t_{net}, in mm, is given by:

$$t_{net} = t - t_c$$

where: t – as-built thickness, in mm, of floors and girders;

t_c – corrosion diminution, equal to 2 mm, in general; a lower value of t_c may be adopted, provided that measures are taken, to the Society's satisfaction, to justify the assumption made.

S22.3.1 Floor shear strength

The floor shear strength in way of the floor panel adjacent to hoppers S_{f1}, in kN, and the floor shear strength in way of the openings in the "outermost" bay (i.e. that bay which is closest to hopper) S_{f2}, in kN, are given by the following expressions:

$$S_{f1} = 10^{-3} \cdot A_f \cdot \frac{\tau_a}{\eta_1}$$

$$S_{f2} = 10^{-3} \cdot A_{f,h} \cdot \frac{\tau_a}{\eta_2}$$

where: A_f – sectional area, in mm^2, of the floor panel adjacent to hoppers;

$A_{f,h}$ – net sectional area, in mm^2, of the floor panels in way of the openings in the "outermost" bay (i.e. that bay which is closest to hopper);

τ_a – allowable shear stress, in N/mm^2, to be taken equal to: $\sigma_F / \sqrt{3}$;

σ_F – minimum upper yield stress, in N/mm^2, of the material;

η_1 = 1.10;

η_2 = 1.20.

η_2 may be reduced, at the Society's discretion, down to 1.10 where appropriate reinforcements are fitted to the Society's satisfaction.

S22.3.2 Girder shear strength

The girder shear strength in way of the girder panel adjacent to stools (or transverse bulkheads, if no stool is fitted) S_{g1}, in kN, and the girder shear strength in way of the largest opening in the "outermost" bay (i.e. that bay which is closest to stool, or transverse bulkhead, if no stool is fitted) S_{g2}, in kN, are given by the following expressions:

$$S_{g1} = 10^{-3} \cdot A_g \cdot \frac{\tau_a}{\eta_1}$$

$$S_{g2} = 10^{-3} \cdot A_{g,h} \cdot \frac{\tau_a}{\eta_2}$$

where: A_g – minimum sectional area, in mm^2, of the girder panel adjacent to stools (or transverse bulkheads, if no stool is fitted);

$A_{g,h}$ – net sectional area, in mm^2, of the girder panel in way of the largest opening in the "outermost" bay (i.e. that bay which is closest to stool, or transverse bulkhead, if no stool is fitted);

η_1 = 1.10;

η_2 = 1.15.

η_2 may be reduced, at the Society's discretion, down to 1.10 where appropriate reinforcements are fitted to the Society's satisfaction

S22.4 Allowable hold loading

The allowable hold loading W, in t, is given by:

$$W = \rho_c \cdot V \cdot \frac{1}{F}$$

where: F = 1.05 in general

F = 1.00 for steel mill products

ρ_c – cargo density, in t/m^3; for bulk cargoes see S22.2.1; for steel products, ρ_c is to be taken as the density of steel;

V – volume, in m^3, occupied by cargo at a level h_1

$$h_1 = \frac{X}{\rho_c \cdot g}$$

X – for bulk cargoes, the lesser of X_1 and X_2 given by:

$$X = \frac{Z + \rho \cdot g \cdot \left(E \cdot - h_f\right)}{1 + \frac{\rho}{\rho_c}\left(perm - 1\right)}$$

$$X = Z + \rho \cdot g \cdot \left(E - h_f \cdot perm\right)$$

X – for steel products, X may be taken as X_1, using perm = 0;
ρ – sea water density, in t/m^3;
g – 9.81 m/s^2, gravity acceleration;
E – $d_f - 0.1 \cdot D$;
d_f, D – as given in S22.2.2;
h_f – flooding head, in m, as defined in S22.2.2;
$perm$ – permeability of cargo, to be taken as 0.3 for ore (corresponding bulk cargo density for iron ore may generally be taken as 3.0 t/m^3);
Z – the lesser of Z_1 and Z_2 given by:

$$Z_1 = \frac{C_h}{A_{DB,h}}$$

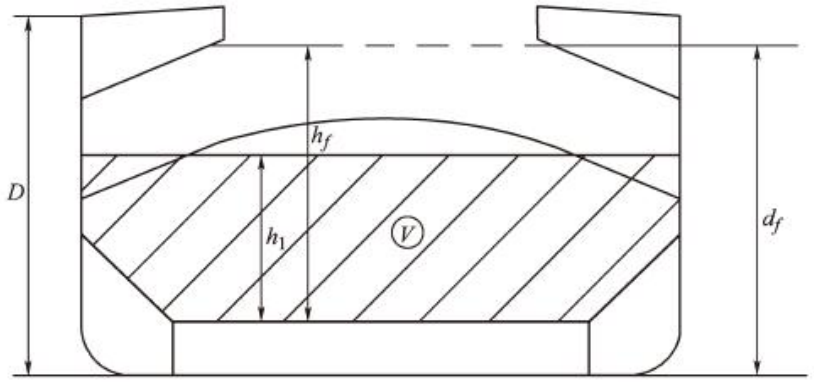
$$Z_2 = \frac{C_e}{A_{DB,e}}$$

C_h – shear capacity of the double bottom, in kN, as defined in S22.3, considering, for each floor, the lesser of the shear strengths S_{f1} and S_{f2} (see S22.3.1) and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} (see S22.3.2);
C_e – shear capacity of the double bottom, in kN, as defined in S22.3, considering, for each floor, the shear strength S_{f1} (see S22.3.1) and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} (see S22.3.2);

$$A_{DB,h} = \sum_{i=1}^{n} S_i \cdot B_{DB,i}$$

$$A_{DB,h} = \sum_{i=1}^{n} S_i \cdot (B_{DB} - s)$$

n – number of floors between stools (or transverse bulkheads, if no stool is fitted);
S_i – space of ith-floor, in m;
$B_{DB,\,i} = B_{DB} - s$ – for floors whose shear strength is given by S_{f1} (see S22.3.1);
$B_{DB,\,i} = B_{DB,\,h}$ – for floors whose shear strength is given by S_{f2} (see S22.3.1);
B_{DB} – breadth of double bottom, in m, between hoppers (see Figure 3);
$B_{DB,\,h}$ – distance, in m, between the two considered openings (see Figure 3);
s – spacing, in m, of double bottom longitudinals adjacent to hoppers.



V = Volume of cargo

Figure 1

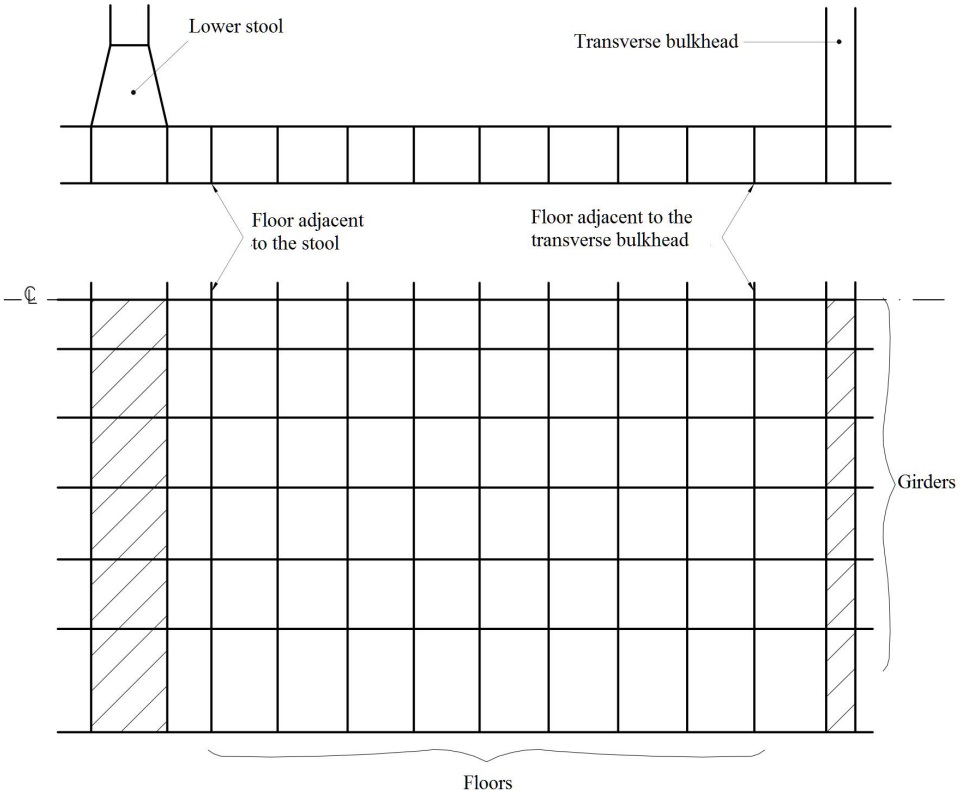


Figure 2

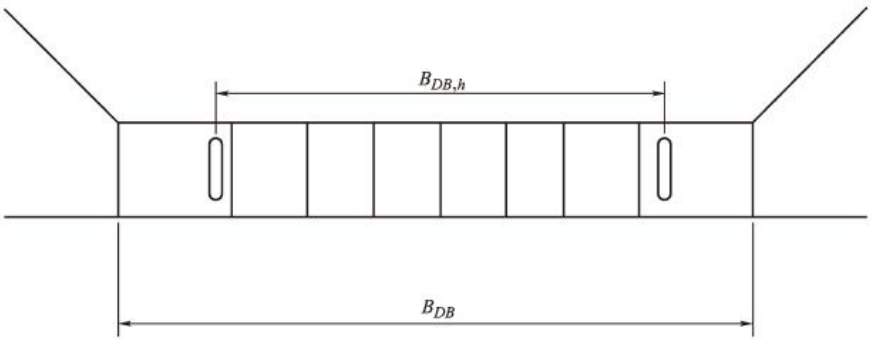

Figure 3

Appendix 19 S23 IMPLEMENTATION OF IACS UNIFIED REQUIREMENTS S19 AND S22 FOR EXISTING SINGLE SIDE SKIN BULK CARRIERS

S23.1 Application and implementation timetable①

a. Unified Requirements S19 and S22 are to be applied in conjunction with the damage stability requirements set forth in S23.2. Compliance is required:

i. for ships which were 20 years of age or more on 1 July 1998, by the due date of the first intermediate, or the due date of the first special survey to be held after 1 July 1998, whichever comes first;

ii. for ships which were 15 years of age or more but less than 20 years of age on 1 July 1998, by the due date of the first special survey to be held after 1 July 1998, but not later than 1 July 2002;

iii. for ships which were 10 years of age or more but less than 15 years of age on 1 July 1998, by the due date of the first intermediate, or the due date of the first special survey to be held after the date on which the ship reaches 15 years of age, but not later than the date on which the ship reaches 17 years of age;

iv. for ships which were 5 years of age or more but less than 10 years of age on 1 July 1998, by the due date, after 1 July 2003, of the first intermediate or the first special survey after the date on which the ship reaches 10 years of age, whichever occurs first;

v. for ships which were less than 5 years of age on 1 July 1998, by the date on which the ship reaches 10 years of age.

b. Completion prior to 1 July 2003 of an intermediate or special survey with a due date after 1 July 2003 cannot be used to postpone compliance. However, completion prior to 1 July 2003 of an intermediate survey the window for which straddles 1 July 2003 can be accepted.

S23.2 Damage Stability

a. Bulk carriers which are subject to compliance with Unified Requirements S19 and S22 shall, when loaded to the summer load line, be able to withstand flooding of the foremost cargo hold in all loading conditions and remain afloat in a satisfactory condition of equilibrium, as specified in SOLAS regulation XII/4.3 to 4.7.

b. A ship having been built with an insufficient number of transverse watertight bulkheads to satisfy this requirement may be exempted from the application of Unified Requirements S19, S22 and this requirement provided the ship fulfills the requirement in SOLAS regulation XII/9.

Annex

1. Surveys to be held

The term “survey to be held” is interpreted to mean that the survey is “being held” until it is “completed”.

2. Due dates and completion allowance

2.1 intermediate survey:

2.1.1 Intermediate survey carried out either at the second or third annual survey: 3 months after the due date (i.e. 2nd or 3rd anniversary) can be used to carry out and complete the survey.

2.1.2 Intermediate survey carried out between the second and third annual survey: 3 months after the due date of the 3rd annual survey can be used to carry out and complete the survey.

2.2 Special survey: 3 months extension after the due date may be allowed subject to the terms/conditions of PR4;

2.3 Ships controlled by “1 July 2002”: same as for special survey;

2.4 Ships controlled by “age 15 years” or “age 17 years”: same as for special survey.

3. Intermediate survey interpretations/applications

3.1 If the 2nd anniversary is prior to or on 1 July 1998 and the intermediate survey is completed prior to or on 1 July 1998, the ship need not comply until the next special survey.

3.2 If the 2nd anniversary is prior to or on 1 July 1998 and the intermediate survey is completed within

① See Annex for details.

the window of the 2nd annual survey but after 1 July 1998, the ship need not comply until the next special survey.
3.3 If the 2nd anniversary is prior to or on 1 July 1998 and the intermediate survey is completed outside the window of the 2nd annual survey and after 1 July 1998, it is taken that the intermediate survey is held after 1 July 1998 and between the second and third annual surveys. Therefore, the ship shall comply no later than 3 months after the 3rd anniversary.
3.4 If the 2nd anniversary is after 1 July 1998 and the intermediate survey is completed within the window of the 2nd annual survey but prior to or on 1 July 1998, the ship need not comply until the next special survey.
3.5 If the 3rd anniversary is prior to or on 1 July 1998 and the intermediate survey is completed prior to or on 1 July 1998, the ship need not comply until the next special survey.
3.6 If the 3rd anniversary is prior to or on 1 July 1998 and the intermediate survey is completed within the window of the 3rd annual survey but after 1 July 1998, the ship need not comply until the next special survey.
3.7 If the 3rd anniversary is after 1 July 1998 and the intermediate survey is completed within the window prior to or on 1 July 1998, the ship need not comply until the next special survey.

4. Special survey interpretations/applications
4.1 If the due date of a special survey is after 1 July 1998 and the special survey is completed within the 3 month window prior to the due date and prior to or on 1 July 1998, the ship need not comply until the next relevant survey (i.e. special survey for ships under 20 years of age on 1 July 1998, intermediate survey for ships 20 years of age or more on 1 July 1998).

5. Early completion of an intermediate survey (coming due after 1 July 1998 to postpone compliance is not allowed):
5.1 Early completion of an intermediate survey means completion of the survey prior to the opening of the window (i.e. completion more than 3 months prior to the 2nd anniversary since the last special survey).
5.2 The intermediate survey may be completed early and credited from the completion date but in such a case the ship will still be required to comply not later than 3 months after the 3rd anniversary.

6. Early completion of a special survey (coming due after 1 July 1998 to postpone compliance is not allowed):
6.1 Early completion of a special survey means completion of the survey more than 3 months prior to the due date of the special survey.
6.2 The special survey may be completed early and credited from the completion date, but in such a case the ship will still be required to comply by the due date of the special survey.

Appendix 20 S31 RENEWAL CRITERIA FOR SIDE SHELL FRAMES AND BRACKETS IN SINGLE SIDE SKIN BULK CARRIERS AND SINGLE SIDE SKIN OBO CARRIERS NOT BUILT IN ACCORDANCE WITH UR S12 REV.1 OR SUBSEQUENT REVISIONS

Notes:
1. This UR is to be applied to bulk carriers and OBO carriers of single side skin construction, as defined above, in conjunction with UR Z10.2 (Rev.15, 2003 and Corr.1, 2004). Z10.2.1.1.5 refers.
2. The changes introduced in Rev.3 are to be applied not later than on assessments for compliance commenced on or after 1 July 2006.
3. The changes introduced in Rev.4 are to be applied not later than on assessments for compliance commenced on or after 1 July 2008.

S31.1 Application and definitions

These requirements apply to the side shell frames and brackets of cargo holds bounded by the single side shell of bulk carriers constructed with single deck, topside tanks and hopper tanks in cargo spaces intended primarily to carry dry cargo in bulk, which were not built in accordance with UR S12 Rev.1 or subsequent revisions.

In addition, these requirements also apply to the side shell frames and brackets of cargo holds bounded by the single side shell of oil/bulk/ore (OBO) carriers, as defined in UR Z11 but of single side skin construction.

In the case a ship as defined above does not satisfy above definition in one or more holds, the requirements in UR S31 do not apply to these individual holds.

For the purpose of this UR, “ships” means both “bulk carriers” and “OBO carriers” as defined above, unless otherwise specified.

Bulk carriers subject to these requirements are to be assessed for compliance with the requirements of this UR and steel renewal, reinforcement or coating, where required in accordance with this UR, is to be carried out in accordance with the following schedule and at subsequent intermediate and special surveys.

i. For bulk carriers which will be 15 years of age or more on 1 January 2004 by the due date of the first intermediate or special survey after that date.
ii. For bulk carriers which will be 10 years of age or more on 1 January 2004 by the due date of the first special survey after that date.
iii. For bulk carriers which will be less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.

Completion prior to 1 January 2004 of an intermediate or special survey with a due date after 1 January 2004 cannot be used to postpone compliance. However, completion prior to 1 January 2004 of an intermediate survey the window for which straddles 1 January 2004 can be accepted.

OBO carriers subject to these requirements are to be assessed for compliance with the requirements of this UR and steel renewal, reinforcement or coating, where required in accordance with this UR, is to be carried out in accordance with the following schedule and at subsequent intermediate and special surveys.

i. For OBO carriers which will be 15 years of age or more on 1 July 2005 by the due date of the first intermediate or special survey after that date.
ii. For OBO carriers which will be 10 years of age or more on 1 July 2005 by the due date of the first special survey after that date.
iii. For OBO carriers which will be less than 10 years of age on 1 July 2005 by the date on which the ship reaches 10 years of age.

Completion prior to 1 July 2005 of an intermediate or special survey with a due date after 1 July 2005 cannot be used to postpone compliance. However, completion prior to 1 July 2005 of an intermediate survey the window for which straddles 1 July 2005 can be accepted.

These requirements define steel renewal criteria or other measures to be taken for the webs and flanges of side shell frames and brackets as per S31.2.

Reinforcing measures of side frames are also defined as per S31.2.3.

Finite element or other numerical analysis or direct calculation procedures cannot be used as an alternative to compliance with the requirements of this UR, except in cases of unusual side structure arrangements or framing to which the requirements of this UR cannot be directly applied. In such cases, the analysis criteria and the strength check criteria are to be in accordance with each Society’s Rules.

S31.1.1 Ice strengthened ships

S31.1.1.1 Where ships are reinforced to comply with an ice class notation, the intermediate frames are not to be included when considering compliance with S31.

S31.1.1.2 The renewal thicknesses for the additional structure required to meet the ice strengthening notation are to be based on the class society's requirements.

S31.1.1.3 If the ice class notation is requested to be withdrawn, the additional ice strengthening structure, with the exception of tripping brackets (see S31.2.1.2.1.b and S31.2.3), is not to be considered to contribute to compliance with S31.

S31.2 Renewal or other measures

S31.2.1 Criteria for renewal or other measures

S31.2.1.1 Symbols used in S31.2.1

t_M – thickness as measured, in mm;

t_{REN} – thickness at which renewal is required. See S31.2.1.2;

$t_{REN,\ d/t}$ – thickness criteria based on d/t ratio. See S31.2.1.2.1;

$t_{REN,\ S}$ – thickness criteria based on strength. See S31.2.1.2.2;

t_{COAT} = 0.75 t_{SI2};

t_{SI2} – thickness in mm as required by UR S12 (Rev.3) in S12.3 for frame webs and in S12.4 for upper and lower bracket webs;

t_{AB} – thickness as-built, in mm;

t_C – see Table 1 below.

t_C values, in mm **Table 1**

Ship's length L, in m	Holds other than No.1		Hold No.1	
	Span and upper brackets	Lower brackets	Span and upper brackets	Lower brackets
≤100	2.0	2.5	2.0	3.0
150	2.0	3.0	3.0	3.5
≥200	2.0	3.0	3.0	4.0
Note: For intermediate ship lengths, t_C is obtained by linear interpolation between the above values.				

S31.2.1.2 Criteria for webs (Shear and other checks)

The webs of side shell frames and brackets are to be renewed when the measured thickness (t_M) is equal to or less than the thickness (t_{REN}) as defined below:

t_{REN} is the greatest of:

(a) $t_{COAT} - t_C$;

(b) 0.75 t_{AB};

(c) $t_{REN,\ d/t}$ (applicable to Zone A and B only);

(d) $t_{REN,\ S}$ (where required by S31.2.1.2.2).

S31.2.1.2.1 Thickness criteria based on d/t ratio

Subject to b) and c) below, $t_{REN,\ d/t}$ is given by the following equation:

$$t_{REN,}d/t = (\text{web depth in mm})/R$$

where: R = for frames:

$65k^{0.5}$ – for symmetrically flanged frames;

$55k^{0.5}$ – for asymmetrically flanged frames;

for lower brackets (see a) below):

$87k^{0.5}$ – for symmetrically flanged frames;

$73k^{0.5}$ – for asymmetrically flanged frames;

k = 1.0 – for ordinary hull structural steel and according to UR S4 for higher tensile steel.

In no instance is $t_{REN,\ d/t}$ for lower integral brackets to be taken as less than $t_{REN,\ d/t}$ for the frames they support.

a) Lower brackets

Lower brackets are to be flanged or face plate is to be fitted, refer to S31.2.1.3.

In calculating the web depth of the lower brackets, the following will apply:

- The web depth of lower bracket may be measured from the intersection of the sloped bulkhead of the hopper tank and the side shell plate, perpendicularly to the face plate of the lower bracket (see Figure 3).
- Where stiffeners are fitted on the lower bracket plate, the web depth may be taken as the distance between the side shell and the stiffener, between the stiffeners or between the outermost stiffener and the face plate of the brackets, whichever is the greatest.

b) Tripping bracket alternative

When t_M is less than $t_{REN,d/t}$ at section b of the side frames, tripping brackets in accordance with S31.2.3 may be fitted as an alternative to the requirements for the web depth to thickness ratio of side frames, in which case $t_{REN,d/t}$ may be disregarded in the determination of t_{REN} in accordance with S31.2.1.2. The value of t_{REN} is to be based on zone B according to UR Z10.2, Annex V, see Figure 1.

c) Immediately abaft collision bulkhead

For the side frames, including the lower bracket, located immediately abaft the collision bulkheads, whose scantlings are increased in order that their moment of inertia is such to avoid undesirable flexibility of the side shell, when their web as built thickness t_{AB} is greater than 1.65 $t_{REN,\,S}$, the thickness $t_{REN,\,d/t}$ may be taken as the value $t'_{REN,\,d/t}$ obtained from the following equation:

$$t'_{REN,d/t} = \sqrt[3]{t^2_{REN,d/t}\, t_{REN,S}}$$

where $t_{REN,\,S}$ is obtained from S31.3.3

S31.2.1.2.2 Thickness criteria based on shear strength check

Where t_M in the lower part of side frames, as defined in Figure 1, is equal to or less than t_{COAT}, $t_{REN,\,S}$ is to be determined in accordance with S31.3.3.

S31.2.1.2.3 Thickness of renewed webs of frames and lower brackets

Where steel renewal is required, the renewed webs are to be of a thickness not less than t_{AB}, 1.2 t_{COAT} or 1.2 t_{REN}, whichever is the greatest.

S31.2.1.2.4 Criteria for other measures

When $t_{REN} < t_M \leq t_{COAT}$, measures are to be taken, consisting of all the following:

a) sand blasting, or equivalent, and coating (see S31.2.2);

b) fitting tripping brackets (see S31.2.3), when the above condition occurs for any of the side frame zones A, B, C and D, shown in Figure 1. Tripping brackets not connected to flanges are to have soft toe, and the distance between the bracket toe and the frame flange is not to be greater than about 50 mm, see Figure 4;

c) maintaining the coating in "as-new" condition (i.e. without breakdown or rusting) at special and intermediate surveys.

The above measures may be waived if the structural members show no thickness diminution with respect to the as-built thicknesses and coating is in "as-new" condition (i.e. without breakdown or rusting).

When the measured frame webs thickness t_M is such that $t_{REN} < t_M \leq t_{COAT}$ and the coating is in GOOD condition, sand blasting and coating as required in a) above may be waived even if not found in "as-new" condition, as defined above, provided that tripping brackets are fitted and the coating damaged in way of the tripping bracket welding is repaired.

S31.2.1.3 Criteria for frames and brackets (Bending check)

When lower end brackets were not fitted with flanges at the design stage, flanges are to be fitted so as to meet the bending strength requirements in S31.3.4. The full width of the bracket flange is to extend up beyond the point at which the frame flange reaches full width. Adequate back-up structure in the hopper is to be ensured, and the bracket is to be aligned with the back-up structure.

Where the length or depth of the lower bracket does not meet the requirements in S12 (Rev.3), a bending strength check in accordance with S31.3.4 is to be carried out and renewals or reinforcements of frames and/or brackets effected as required therein.

The bending check need not to be carried out in the case the bracket geometry is modified so as to comply with S12 (Rev.3) requirements.

S31.2.2 Thickness measurements, steel renewal, sand blasting and coating

For the purpose of steel renewal, sand blasting and coating, four zones A, B, C and D are defined, as shown in Figure 1. When renewal is to be carried out, surface preparation and coating are required for the renewed structures as given in UR Z9 for cargo holds of newbuildings.

Representative thickness measurements are to be taken for each zone and are to be assessed against the criteria in S31.2.1.

When zone B is made up of different plate thicknesses, the lesser thickness is to be used for the application of the requirements in S31.

In case of integral brackets, when the criteria in S31.2.1 are not satisfied for zone A or B, steel renewal, sand blasting and coating, as applicable, are to be done for both zones A and B.

In case of separate brackets, when the criteria in S31.2.1 are not satisfied for zone A or B, steel renewal, sand blasting and coating is to be done for each one of these zones, as applicable.

When steel renewal is required for zone C according to S31.2.1, it is to be done for both zones B and C.

When sand blasting and coating is required for zone C according to S31.2.1, it is to be done for zones B, C and D.

When steel renewal is required for zone D according to S31.2.1, it needs only to be done for this zone.

When sand blasting and coating is required for zone D according to S31.2.1, it is to be done for both zones C and D.
Special consideration may be given by the Society to zones previously renewed or re-coated, if found in "as-new" condition (i.e., without breakdown or rusting).
When adopted, on the basis of the renewal thickness criteria in S31.2.1, in general coating is to be applied in compliance with the requirements of UR Z9, as applicable.
Where, according to the requirements in S31.2.1, a limited number of side frames and brackets are shown to require coating over part of their length, the following criteria apply.
a) The part to be coated includes:
- the web and the face plate of the side frames and brackets;
- the hold surface of side shell, hopper tank and topside tank plating, as applicable, over a width not less than 100 mm from the web of the side frame.

b) Epoxy coating or equivalent is to be applied.
In all cases, all the surfaces to be coated are to be sand blasted prior to coating application.
When flanges of frames or brackets are to be renewed according to S31, the outstanding breadth to thickness ratio is to comply with the requirements in UR S12.5.

S31.2.3 Reinforcing measures

Reinforcing measures are constituted by tripping brackets, located at the lower part and at midspan of side frames (see Figure 4). Tripping brackets may be located at every two frames, but lower and midspan brackets are to be fitted in line between alternate pairs of frames.
The thickness of the tripping brackets is to be not less than the as-built thickness of the side frame webs to which they are connected.
Double continuous welding is to be adopted for the connections of tripping brackets to the side shell frames and shell plating.
Where side frames and side shell are made of Higher Strength Steel (HSS), Normal Strength Steel (NSS), tripping brackets may be accepted, provided the electrodes used for welding are those required for the particular HSS grade, and the thickness of the tripping brackets is equal to the frame web thickness, regardless of the frame web material.

S31.2.4 Weld throat thickness

In case of steel renewal the welded connections are to comply with UR S12.7 of UR S12 (Rev.3).

S31.2.5 Pitting and grooving

If pitting intensity is higher than 15% in area (see Figure 5), thickness measurement is to be taken to check pitting corrosion.
The minimum acceptable remaining thickness in pits or grooves is equal to:
- 75% of the as-built thickness, for pitting or grooving in the frame and brackets webs and flanges;
- 70% of the as-built thickness, for pitting or grooving in the side shell, hopper tank and topside tank plating attached to the side frame, over a width up to 30 mm from each side of it.

S31.2.6 Renewal of all frames in one or more cargo holds

When all frames in one or more holds are required to be renewed according to UR S31, the compliance with the requirements in URS 12 (Rev. 1) may be accepted in lieu of the compliance with the requirements in UR S31, provided that:
- it is applied at least to all the frames of the hold(s);
- the coating requirements for side frames of "new ships" are complied with;
- the section modulus of side frames is calculated according to the Classification Society Rules.

S31.2.7 Renewal of damaged frames

In case of renewal of a damaged frame already complying with S31, the following requirements apply:
- The conditions accepted in compliance with S31 are to be restored as a minimum.
- For localised damages, the extension of the renewal is to be carried out according to the standard practice of each Classification Society.

S31.3 Strength check criteria

In general, loads are to be calculated and strength checks are to be carried out for the aft, middle and forward frames of each hold. The scantlings required for frames in intermediate positions are to be obtained by linear interpolation between the results obtained for the above frames.
When scantlings of side frames vary within a hold, the required scantlings are also to be calculated for the mid frame of each group of frames having the same scantlings. The scantlings required for frames in intermediate positions are to be obtained by linear interpolation between the results obtained for the calculated frames.

S31.3.1 Load model

The following loading conditions are to be considered:
– homogeneous heavy cargo (density greater than 1.78 t/m^3);
– homogeneous light cargo (density less than 1.78 t/m^3);
– nonhomogeneous heavy cargo, if allowed;
– multi-port loading/unloading conditions need not be considered.

S31.3.1.1 Forces

The forces $P_{fr,\,a}$ and $P_{fr,\,b}$, in kN, to be considered for the strength checks at sections a) and b) of side frames (specified in Figure 2; in the case of separate lower brackets, section b) is at the top of the lower bracket), are given by:

$$P_{fr,a} = P_S + \max\,(P_1, P_2)$$

$$P_{fr,b} = P_{fr,a}\,\frac{h - 2h_B}{h}$$

where: P_s – still water force, in kN:

= $sh\left(\frac{P_{S,U} + P_{S,L}}{2}\right)$ when the upper end of the side frame span h (see Figure 1) is below the load water line;

= $sh'\left(\frac{P_{S,L}}{2}\right)$ when the upper end of the side frame span h (see Figure 1) is at or above the load water line;

P_1 – wave force, in kN, in head sea:

= $sh\left(\frac{P_{1,U} + P_{1,L}}{2}\right)$;

P_2 – wave force, in kN, in beam sea:

= $sh\left(\frac{P_{2,U} + P_{2,L}}{2}\right)$;

h, h_B – side frame span and lower bracket length, in m, defined in Figures 1 and 2, respectively;

h’ – distance, in m, between the lower end of side frame span (see Figure 1) and the load water line;

s – frame spacing, in m;

$p_{S,\,U}$, $p_{S,\,L}$ – still water pressure, in kN/m^2, at the upper and lower end of the side frame span h (see Figure 1), respectively;

$p_{1,\,U}$, $p_{1,\,L}$ – wave pressure, in kN/m^2, as defined in S31.3.1.2.1) below for the upper and lower end of the side frame span h, respectively;

$p_{2,\,U}$, $p_{2,\,L}$ – wave pressure, in kN/m^2, as defined in S31.3.1.2.2) below for the upper and lower end of the side frame span h, respectively.

S31.3.1.2 Wave pressure

1) Wave pressure p_1

The wave pressure p_1, in kN/m^2, at and below the waterline is given by:

$$p_1 = 1.50\left[p_{11} + 135\,\frac{B}{2(B+75)} - 1.2(T - z)\right]$$

$$p_{11} = 3\,k_s\,C + k_f$$

The wave pressure p_1, in kN/m^2, above the water line is given by:

$$p_1 = p_{1wl} - 7.50\,(z - T)$$

2) Wave pressure p_2

The wave pressure p_2, in kN/m^2, at and below the waterline is given by

$$p_2 = 13.0\left[0.5B\,\frac{50C_f}{2(B+75)} + C_B\,\frac{0.5B + k_f}{14}\left(0.7 + 2\,\frac{z}{T}\right)\right]$$

The wave pressure p_2, in kN/m^2, above the water line is given by:

$$p_2 = p_{2wl} - 5.0\,(z - T)$$

where: p_{1wl} – p_1 wave sea pressure at the waterline;

p_{2wl} – p_2 wave sea pressure at the waterline;

L – Rule length, in m, as defined in UR S2;

B – greatest moulded breadth, in m;

C_B – block coefficient, as defined in UR S2, but not to be taken less than 0.6;

T – maximum design draught, in m;

C – coefficient:

= $10.75 - \left(\frac{300 - L}{100}\right)^{1.5}$ for $90 \le L \le 300$ m;

= 10.75 for 300 m < L;

C_f = $\left(1.25 - 0.025\frac{2k_r}{\sqrt{GM}}\right)k$ for $350 \text{ m} \le L \le 500$ m;

k = 1.2, for ships without bilge keel;

= 1.0, for ships with bilge keel;

k_r – roll radius of gyration, if the actual value of k_r is not available:

= 0.39 B, for ships with even distribution of mass in transverse section (e.g. alternate heavy cargo loading or homogeneous light cargo loading);

= 0.25 B, for ships with uneven distribution of mass in transverse section (e.g. homogeneous heavy cargo distribution);

GM – 0.12 B if the actual value of GM is not available;

z – vertical distance, in m, from the baseline to the load point;

k_s = $C_B + \frac{0.83}{\sqrt{C_B}}$ at aft end of L;

= C_B, between 0.2 L and 0.6 L from aft end of L;

= $C_B + \frac{1.33}{C_B}$ at forward end of L.

Between the above specified points, k_s is to be interpolated linearly;

k_f = $0.8C$.

S31.3.2 Allowable stresses

The allowable normal and shear stresses σ_a and τ_a, in N/mm^2, in the side shell frames and brackets are given by:

$$\sigma_a = 0.90\ \sigma_F$$
$$\tau_a = 0.40\ \sigma_F$$

where: σ_F is the minimum upper yield stress, in N/mm^2, of the material.

S31.3.3 Shear strength check

Where t_M in the lower part of side frames, as defined in Figure 1, is equal to or less than t_{COAT}, shear strength check is to be carried out in accordance with the following.

The thickness $t_{REN,\,S}$, in mm, is the greater of the thicknesses $t_{REN,\,S\,a}$ and $t_{REN,\,S\,b}$ obtained from the shear strength check at sections a) and b) (see Figure 2 and S31.3.1) given by the following, but need not be taken in excess of $0.75t_{S12}$.

at section a): $$t_{REN,Sa} = \frac{1000k_s P_{fr,a}}{d_a \sin\phi \tau_a}$$

at section b): $$t_{REN,Sb} = \frac{1000k_s P_{fr,b}}{d_b \sin\phi \tau_a}$$

where: k_s – shear force distribution factor, to be taken equal to 0.6;

$P_{fr,\,a}$, $P_{fr,\,b}$ – pressure forces defined in S31.3.1.1;

d_a, d_b – bracket and frame web depth, in mm, at sections a) and b), respectively (see Figure 2); in case of separate (non integral) brackets, d_b is to be taken as the minimum web depth deducing possible scallops;

φ – angle between frame web and shell plate;

τ_a – allowable shear stress, in N/mm^2, defined in S31.3.2.

S31.3.4 Bending strength check

Where the lower bracket length or depth does not meet the requirements in UR S12 (Rev. 3), the actual section modulus, in cm^3, of the brackets and side frames at sections a) and b) is to be not less than:

at section a): $$Z_a = \frac{1000P_{fr,a}h}{m_a\sigma_a}$$

at section b): $$Z_b = \frac{1000P_{fr,a}h}{m_b\sigma_a}$$

where: $P_{fr,\,a}$ – pressures force defined in S31.3.1.1;

h – side frame span, in m, defined in Figure 1;

σ_a – allowable normal stress, in N/mm^2, defined in S31.3.2;
m_a, m_b – bending moment coefficients as defined in Table 2.

Bending Moment Coefficients m_a and m_b **Table 2**

	m_a	m_b		
		$h_B \leq 0.08\ h$	$h_B = 0.1\ h$	$h_B \geq 0.125\ h$
Empty holds of ships approved to operate in non-homogeneous loading conditions	10	17	19	22
Other cases	12	20	22	26

Notes:
1. Non-homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for each hold, exceeds 1.20 corrected for different cargo densities.
2. For intermediate values of the bracket length h_B, the coefficient m_b is obtained by linear interpolation between the table values.

The actual section modulus of the brackets and side frames is to be calculated about an axis parallel to the attached plate, based on the measured thicknesses. For precalculations, alternative thickness values may be used, provided they are not less than:
– t_{REN}, for the web thickness;
– the minimum thicknesses allowed by the Society renewal criteria for flange and attached plating.
The attached plate breadth is equal to the frame spacing, measured along the shell at midspan of h.
If the actual section moduli at sections a) and b) are less than the values Z_a and Z_b, the frames and brackets are to be renewed or reinforced in order to obtain actual section moduli not less than 1.2 Z_a and 1.2 Z_b, respectively.
In such a case, renewal or reinforcements of the flange are to be extended over the lower part of side frames, as defined in Figure 1.

Appendix 21 GUIDELINES FOR PILOT SCHEMES OF EXTENDED INTERVAL BETWEEN SURVEYS IN DRY-DOCK − EXTENDED DRY-DOCKING (EDD) SCHEME

1 General requirements

1.1 Introduction

1.1.1 The intervals between inspections of the outside of the ship's bottom are specified in SOLAS, IACS Regulations and CCS Rules and require a minimum of two inspections to be carried out during the 5-year validity period of the Safety Construction Certificate/Special Survey period. SOLAS regulation I/10(v) only requires a minimum of two inspections of the outside of the ship's bottom and does not specify a ship must be dry-docked out of the water.

1.1.2 IMO resolution A.1053(27), as amended, "Survey guidelines for the harmonized system of survey and certification", requires that inspections of the outside of the ship's bottom should normally be carried out with the ship in a dry-dock. However, it also provides that Administrations may give consideration to alternate inspections being carried out with the ship afloat.

1.1.3 This Guidelines recommends the acceptance procedure for pilot schemes which extend the interval between surveys in dry-dock. Ships eligible for the Extended Dry-Docking (EDD) scheme are to meet the provisions and conditions described in this Guidelines.

1.1.4 Qualifying ships may be permitted to carry out two consecutive in-water surveys, subject to the conditions described in this Guidelines. A minimum of two inspections of the outside of the ship's bottom is to be carried out during the statutory renewal period/special survey period of five years and the intervals between any two inspections are not to exceed 36 months.

1.1.5 Pilot schemes which extend the interval between out of water dry-docking surveys are normally tripartite projects between the Owner, flag Administration and CCS. Acceptance into such a Pilot scheme is subject to the formal written agreement with the ship's flag Administration including any additional specific flag Administration requirements.

1.2 Application

1.2.1 Owners/Managers requesting a ship be considered for the EDD scheme, are to apply to CCS in writing confirming and describing compliance with the requirements and conditions specified in this Guidelines.

1.2.2 Upon the Owner's request, the extended interval for each ship will be considered on a case by case basis by CCS. CCS may assist in forwarding the Owner's application to the flag Administration.

1.2.3 The following ships and ship types are not eligible for the extended dry-docking scheme described in this Guidelines:

− passenger ships;
− ships subject to the Enhanced Survey Program (ESP);
− ships subject to requirements of section 5 of Chapter 5 of this PART;
− ships fitted with propulsion thrusters;
− ships where the propeller connection to the shaft is by means of a keyed taper;
− high speed craft (HSC).

1.2.4 The dry-docking scheme will operate, based upon the ship's age when entering the scheme. For ships already in service, the extended dry-docking scheme may be implemented at any time until a ship reaches 10 years of age. (Namely that once a ship reaches 10 years of age, inspections of the outside of the ship's bottom must be carried out in dry-dock during the 10-year special survey period.)

1.2.5 No extensions are to be granted for the dry-docking required at the end of each extended dry docking period.

1.3 Information to be submitted by the owner

1.3.1 Prior to acceptance into an EDD scheme, the owner is to submit the following information:

(1) provisions for carrying out maintenance required on electric/electronic sensors e.g. Echo-sounder, Doppler-Log, Speedlog (propeller speedlog or backpressure speedlog), seawater temperature gauges, electronic draught reading, etc.;

(2) provisions for maintaining the draft marks fore, aft and midships as well as load line marks (painted and welded figures) and all other required hull markings;

(3) maintenance required of thrusters and stabilisers, if fitted, and provision for carrying out surveys or maintenance or as required by the surveyor;

(4) service experience to-date with hull coating system covered by manufacturer's guarantee that the underwater coatings used are designed to last for the extended period since the coating is to remain effective for the extended dry docking period;
(5) impressed cathodic protection system or provisions for renewal of external hull sacrificial anodes in the afloat condition.

1.4 Preparatory reviews by CCS

1.4.1 CCS is to carry out the following reviews prior to accepting a ship into an EDD scheme:
(1) satisfactory review of the items submitted by the owner as required in 1.3 above;
(2) review of ship's history with particular attention to any previous findings affecting the underwater body.

1.5 Arrangements

1.5.1 Prior to acceptance into an EDD scheme, ships enrolled an extended dry-docking interval scheme are to comply with the following provisions:
(1) The ship is to comply with the In-Water Survey provisions in accordance with the corresponding requirements of CCS.
(2) Protective coating in double bottom/double side ballast tanks, void spaces and all other spaces adjacent to the shell is to be maintained in GOOD condition.
(3) The shafting arrangement is to fulfil the applicable CCS requirements for tailshaft condition monitoring survey arrangement. Namely that the ship is to be assigned with SCM class notation.
(4) Hull maintenance scheme to be implemented in accordance with ISM requirements.

2 Survey requirements

2.1 In-water survey requirements

2.1.1 The In-Water Survey is to be carried out in accordance with the requirements of 5.2.3, section 2 and section 11, Chapter 5 of this PART.
2.1.2 An in-water survey plan is to be submitted to CCS for review in advance of the survey and should include the following:
(1) scheduled time and location for survey;
(2) name of approved diving company;
(3) means for cleaning of the hull below waterline;
(4) means of access for examination of sea chests, sea valves and box coolers;
(5) provisions for determining the condition of anchoring equipment, ranging of anchor chain cables and examination of the chain lockers when due for survey and/or as required by the surveyor;
(6) provisions for surveying and maintaining sea connections including thickness measurements of sea chests;
(7) results of inspections by the Owner's personnel of double bottom/double side ballast tanks (during the last 3 years) and other spaces adjacent to the shell with reference to structural deterioration in general, leakages in tank boundaries and piping and condition of the protective coating;
(8) conditions for internal examination of double bottom/double side ballast tanks (e.g. information regarding tank cleaning, gas freeing, ventilation, lighting, etc.).
2.1.3 Prior to commencement of the in-water survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the diving company and the master of the ship or an appropriate representative appointed by the owner for the purpose of ascertaining that all the arrangements envisaged in the survey plan are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.
2.1.4 A comprehensive report of findings, gaugings, clearances and any work undertaken, including recordings of representative CCTV images, must be submitted by the ship owner to all involved parties.

2.2 Special survey/statutory renewal requirements

2.2.1 It should be noted that the periodicity of the ship's special survey and statutory renewal surveys will not change, therefore provision must be made for carrying out all such surveys and any repairs afloat, where not dry-docking.

2.3 Survey findings

2.3.1 If the In-Water Survey reveals damage, deterioration or other conditions that requires early attention, the surveyor may require that the ship be dry-docked in order that a detailed survey can be undertaken and necessary repairs carried out.
2.3.2 If temporary repairs carried out to any underwater parts are considered acceptable these must be

made permanent within a due date decided by the surveyor.

2.3.3 The owner is to request CCS to perform a survey in dry-dock in any event or circumstance in the operation of the ship which could have led to underwater damages or deterioration in the crew's knowledge or opinion.

2.3.4 If the coating condition in double bottom/double side ballast tanks, void spaces and dry spaces is found in less than GOOD condition, the owner is to restore the coating to GOOD.

3 Termination of scheme

3.1 Termination of EDD scheme

3.1.1 The dry-docking survey required for the special survey at 15 years of age is to be carried out in a dry-dock. All ships in an EDD scheme are to be dis-enrolled once the ship reaches 15 years of age.

3.1.2 The Extended Dry-docking Scheme will be terminated in cases of change of the ship's owner, management or flag Administration.

3.1.3 CCS may dis-enroll a ship from an EDD scheme at any time should it be found that the conditions for maintaining this extended dry-dock scheme are not fulfilled anymore.

3.1.4 Once the conditions for the scheme are no longer present, the ship will return to the normal docking interval and any due dock survey is to be carried out by the due date.

Appendix 22 CONDITION MONITORING AND CONDITION BASED MAINTENANCE①

1 General

1.1 Application

1.1.1 These requirements apply to the approved Condition Monitoring and Condition Based Maintenance schemes where the condition monitoring results are used to influence the scope and/or frequency of Class survey.

1.1.2 This scheme may be applied to components and systems covered by Continuous Machinery Survey (CMS), and other components and systems as requested by the owner. The extent of Condition Based Maintenance and associated monitoring equipment to be included in the maintenance scheme is decided by the Owner.

1.1.3 These requirements can be applied only to vessels operating on approved PMS survey scheme.

1.1.4 The scheme may be applied to any individual items and systems. Any items not covered by the scheme shall be surveyed and credited in accordance with the requirements of Section 9 of this Chapter and / or Appendix 16 of this Chapter.

1.2 Definitions

1.2.1 The following standard terms are defined in ISO 13372:2012:

(1) Condition monitoring: acquisition and processing of information and data that indicate the state of a machine over time. The machine state deteriorates if faults or failures occur.

(2) Diagnostic: examination of symptoms and syndromes to determine the nature of faults or failures.

(3) Condition Based Maintenance: maintenance performed as governed by condition monitoring programmes.

1.3 Condition Monitoring (CM)

1.3.1 Where an approved condition monitoring system is fitted, credit for survey may be based on acceptable condition monitoring results. The condition monitoring results are to be reviewed during the annual audit.

1.3.2 Limiting parameters are to be based on the Original Equipment Manufacturers guidelines (OEM), or a recognised international standard.

1.3.3 The condition monitoring system is to provide an equivalent or greater degree of confidence in the condition of the machinery to traditional survey techniques.

1.3.4 The condition monitoring system shall be approved in accordance with CCS procedures.

1.3.5 A condition monitoring system may be used to provide a greater understanding of equipment condition, and a condition based maintenance scheme may be used to obtain maintenance efficiency. CCS approval is required where owners wish to change the survey cycle based on CM/CBM.

1.3.6 Software systems can use complex algorithms, machine learning and knowledge of global equipment populations/defect data in order to identify acceptability for continued service or the requirement for maintenance. These systems may be independent of the OEM recommended maintenance and condition monitoring suggested limits. Approval of this type of software is to be based on OEM recommendations, industry standards and CCS experience.

1.3.7 CCS retains the right to test or open-up the machinery, irrespective of the CM results, if deemed necessary.

---

① This revision is to be uniformly implemented on and after 1 January 2020.

1.4 Condition Based Maintenance (CBM)

1.4.1 Where an owner wishes to base their equipment maintenance on a CBM approach, this is to meet the requirements of the ISM Code.

1.4.2 Where an agreed planned maintenance and CBM scheme is in operation, the CMS and other survey intervals may be extended based on OEM maintenance recommendations and acceptable condition monitoring results.

1.4.3 Limiting parameters (alarms and warnings) are to be based on the OEM guidelines, or a recognised international standard.

1.4.4 The CBM scheme is to provide an equivalent or greater degree of confidence in the condition of the machinery to traditional maintenance techniques.

1.4.5 The scheme shall be approved in accordance with each CCS procedures.

1.4.6 Software systems can use complex algorithms, machine learning and knowledge of global equipment populations/defect data in order to identify acceptability for continued service or the requirement for maintenance. These systems may be independent of the OEM recommended maintenance and condition monitoring suggested limits. Approval of this type of software is to be based on OEM recommendations, industry standards and CCS experience.

2 Procedures and Conditions for approval of CM and CBM

2.1 Onboard Responsibility

2.1.1 The chief engineer shall be the responsible person on board in charge of the CM and CBM.

2.1.2 Documentation on the overhaul of items covered by CM and CBM schemes shall be reported by the chief engineer.

2.1.3 Access to computerized systems for updating of the maintenance documentation and maintenance program shall only be permitted by the chief engineer or other authorized person.

2.1.4 All personnel involved in CM and CBM shall be appropriately qualified.

Note: CM does not replace routine surveillance or the chief engineer's responsibility for taking decisions in accordance with his judgement.

2.2 Equipment and System Requirements

2.2.1 CM equipment and systems shall be approved in accordance with a procedure of CCS.

2.2.2 The CM/CBM scheme and its extent, are to be approved by CCS.

2.2.3 The CBM scheme is to be capable of producing a condition report, and maintenance recommendations.

2.2.4 A system is to be provided to identify where limiting parameters (alarms and warnings) are modified during the operation of the scheme.

2.2.5 Where CM and CBM schemes use remote monitoring and diagnosis (i.e. data is transferred from the vessel and analysed remotely), the system is to meet the applicable standards for Cyber Safety and Security. The system shall be capable of continued onboard operation in the event of loss of the communication function.

2.2.6 CBM schemes are to identify defects and unexpected failures that were not prevented by the CM system.

2.2.7 Systems shall include a method of backing up data at regular intervals.

2.3 Documentation and Information

2.3.1 The following documentation shall be made available for the approval of the scheme:

(1) Procedure for changes to software system and CM parameters;

(2) Listing of equipment to be included in the scheme;

(3) Listing of acceptable condition monitoring parameters;
(4) Description of CBM scheme;
(5) Listing, specifications and maintenance procedures for condition monitoring equipment;
(6) Baseline data for equipment with condition monitoring;
(7) Qualification of personnel and company responsible for analysing CM results.

2.3.2 In addition to the above documentation the following information shall be available on board:
(1) All clauses in 2.3.1 in an up-to-date fashion;
(2) Maintenance instructions (manufacturer's and shipyard's);
(3) Condition monitoring data including all data since last opening of the machine and the original base line data;
(4) Reference documentation (trend investigation procedures etc.);
(5) Records of maintenance including repairs and renewals carried out;
(6) Records of changes to software systems and parameters;
(7) Sensors calibration records / certification / status.

2.4 Approval validity

2.4.1 An Annual Audit shall be carried out to maintain the validity of the CM/CBM scheme.

2.4.2 The survey arrangement for machinery under CM/CBM can be cancelled by CCS if the scheme is not being satisfactorily carried out either from the maintenance records or the general condition of the machinery.

2.4.3 The case of sale or change of management of the ship or transfer of class shall cause the approval to be reconsidered.

2.4.4 The ship owner may, at any time, cancel the survey arrangement for machinery under the scheme by informing CCS in writing and for this case the items which have been inspected under the scheme since the last annual Audit can be credited for class at the discretion of the attending surveyor.

3 Surveys

3.1 Installation Survey

3.1.1 Condition monitoring equipment is to be installed and surveyed in accordance with CCS rules, and a set of base line readings is to be taken.

3.2 Implementation Survey

3.2.1 The Implementation Survey shall be carried out by CCS surveyor no earlier than 6 months after installation survey and no later than the first Class annual survey.

3.2.2 During the Implementation survey the following shall be verified by a surveyor:
(1) the CM/CBM scheme is implemented according to the approval documentation, including a comparison with baseline data;
(2) the scheme is producing the documentation required for the Annual Audit and the requirements of surveys and testing for the maintenance of class are complied with;
(3) the onboard personnel are familiar with operating the scheme;
(4) records of any limiting parameters (alarms and warnings) that have been modified during the operation of the scheme;
(5) records of any failures of monitored equipment are to be reviewed to ensure that the condition monitoring scheme is effective / sufficient.

3.2.3 When this survey is carried out and the implementation is found in order, a report describing the scheme shall be submitted to CCS and the scheme may be put into service.

3.3 Annual Audit

3.3.1 An annual audit of the CM and CBM scheme shall be carried out by a CCS surveyor concurrently

with the Class annual survey.

3.3.2 The purpose of this audit shall be to verify that the scheme is being correctly operated and that the machinery has been functioning satisfactorily since the previous audit. This is to include any limiting parameters (alarms and warnings) that have been modified since the last audit. A general examination of the items concerned shall be carried out.

3.3.3 The performance, condition monitoring and maintenance records shall be examined to verify that the machinery has functioned satisfactorily since the previous survey, or action has been taken in response to machinery operating parameters exceeding acceptable tolerances.

3.3.4 Written details of break-down or malfunction shall be made available.

3.3.5 At the discretion of the surveyor, function tests, confirmatory surveys and random check readings, where Condition Monitoring / Condition Based Maintenance equipment is in use, shall be carried out as far as practicable and reasonable.

3.3.6 The familiarity of the chief engineer and other personnel involved with the CM system shall be verified.

3.3.7 Calibration status of sensors and equipment shall be verified.

3.3.8 Verification that the suitability of the CM/CBM scheme has been reviewed following defects and failures shall be carried out.

3.4 Damage and repairs

3.4.1 Damage to components or items of machinery is to be reported to CCS. The repairs of such damaged components or items of machinery are to be carried out to the satisfaction of the Surveyor.

3.4.2 Details of repairs and maintenance carried out shall be examined. Any machinery part, which has been replaced by a spare one, due to damage, is to be retained on board where possible until examined by CCS Surveyor.

3.4.3 Defect and failure data is to be reviewed in order to ensure the system output is appropriate. Where necessary, following review of the failure data, there is to be a method of amending the CM and CBM scheme.

Appendix 23 REQUIREMENTS FOR NDT SERVICE SUPPLIERS

1 General

1.1 Scope

1.1.1 Firms providing Non-Destructive Testing (NDT) and Advanced Non-Destructive Testing (ANDT[①]) Services on the new construction of ships and offshore structures subject to classification, need to fulfil the requirements set out in this Appendix. In this Appendix, such firms will be referred to as the NDT Service Supplier.

1.1.2 This Appendix applies to:

(1) Independent NDT companies;

(2) Internal departments of fabricators, e.g., shipyards, hull block/section fabricators performing NDT.

The NDT service specified in this Appendix covers the service application to the following hull structure and associated items at the fabrication stage during new construction:

(1) The welding of components that are integrated into the ship or offshore structure;

(2) The fabrication of independent fuel or cargo tanks (including those intended for low flashpoint fuels, e.g. type A, B and C independent tanks as described in IMO IGC and IGF Codes);

(3) Items listed within the definition of hull structure, as defined in 2.1, Appendix 1, Chapter 4 of this PART;

(4) Rudders of welded construction.

1.1.3 NDT Service Suppliers in the context of this Appendix are not included as part of the scope of Appendix 8, Chapter 5 of this PART.CCS shall verify the NDT Service Supplier in order to determine compliance with the requirements of this Appendix.

1.2 Objective

The objective of this Appendix is to ensure that the NDT Service Supplier is using appropriate procedures, has qualified and certified personnel and has implemented written procedures for training, experience, education, examination, certification, performance, application, control, verification and reporting of NDT. In addition, the NDT Service Supplier shall furnish appropriate equipment and facilities commensurate with providing a professional service.

1.3 Terms and definitions

The following terms and definitions apply for this document.

NDT	Non-destructive testing - the development and application of technical methods to examine materials or components in ways that do not impair their future usefulness and Serviceability, in order to measure geometrical characteristics and to detect, locate, measure and evaluate flaws. NDT is also known as non-destructive examination (NDE), non-destructive inspection (NDI) and non-destructive evaluation (NDE). Comprising, but not limited to the following methods and techniques MT, PT, RT, VT, UT, and ET
ANDT	The above definition of NDT applies, however ANDT includes advanced methods such as RT-D, PAUT, TOFD and AUT
NDT Service Supplier	Independent NDT company or NDT department/section that forms a part of a company providing NDT services on the new construction of ships and offshore structures, as applicable to the bodies performing NDT on the items as listed in paragraph 1.1.2 of this Appendix.
Society	The Classification Society
MT	Magnetic Particle Testing
PT	Penetrant Testing
RT	Radiographic Testing
RT-D	Digital Radiography (Several techniques within the method RT, e.g. Computed Radiography or Direct Radiography).
UT	Ultrasonic Testing
PAUT	Phased Array Ultrasonic Testing (Technique within the method UT).
TOFD	Time of Flight Diffraction (Technique within the method UT).
AUT	Automated Ultrasonic Testing. A technique by which an object is tested by ultrasound using probes operating under mechanical control and where ultrasonic data is collected automatically
ET	Electromagnetic Testing (i.e. Eddy Current Testing and/or Alternating Current Field

① For the remainder of this Appendix, wherever there is a reference to NDT, it also includes ANDT.

Measurements [ACFM])

VT Visual Testing

Industrial sector Section of industry or technology where specialised NDT practices are used, requiring specific product-related knowledge, skill, equipment and/or training.

Product sector A category of component that may be defined by type of manufacturing, fabrication, and/or shape, which may have unique, and/or general manufacturing/fabrication defect characteristics. Product sector examples include (but not limited to): castings, wrought products (forgings), rolled products, extruded products, and welds. NDT personnel may hold certification in a method which is related to a product sector.

1.4 References

The following referenced documents are to be used for the application of this document as appropriate. For undated references, the latest edition of the referenced document (including any amendments) applies.

(1) ISO 9712:2021; Non-destructive testing - Qualification and certification of NDT personnel;

(2) ISO/IEC 17020:2012; Conformity assessment – Requirements for the operation of various types of bodies performing inspection;

(3) ISO/IEC 17024:2012; Conformity assessment – General requirements for bodies operating certification of persons;

(4) ISO 9001:2015; Quality Management Systems – Requirements.

(5) SNT-TC-1A: 2020; Personnel Qualification and Certification in Nondestructive Testing;

(6) ANSI/ASNT CP-189:2020; ASNT Standard for Qualification and Certification of Nondestructive Testing Personnel.

Other national adoptions of the standards listed above are accepted as compliant and hence are accepted for use together with this document.

2 Requirements for the NDT Service Supplier

The NDT Service Supplier shall document, as required in 2.2 to 2.9, that it has the competence and control needed to perform the specified NDT services.

2.1 Requirements for documents

The following documents shall be available for CCS upon request:

(1) an outline of the NDT Service Supplier's organisation and management structure, including any subsidiaries;

(2) information on the structure of the NDT Service Supplier’s Quality Management System;

(3) quality manual and documented procedures covering the requirements given in item 2.2;

(4) for companies with in-house certification of personnel scheme; a written practice developed in accordance with a recognised standard or recommended practice (i.e. ASNT’s SNT-TC-1A, 2020 ANSI/ASNT CP-189, 2020 or similar);

(5) operational work procedures for each NDT method including selection of the NDT technique;

(6) training- and follow-up programmes for NDT operators including practical training on various ship and offshore products;

(7) written statement issued by the employer, based upon the scope of certification, authorising the operator to carry out specified tasks;

(8) procedure for supervisor’s authorisation of NDT operators;

(9) experience of the NDT Service Supplier in the specific service area;

(10) for companies which obtain certification from an accredited certification body; a list of documented training and experience for NDT operators within the relevant NDT service area, including qualifications and third party certification per ISO 9712:2021 based certification schemes;

(11) description of equipment(s) used for the NDT services performed by the NDT Service Supplier;

(12) a guide for NDT operators to use equipment mentioned above;

(13) record formats for recording results of the NDT services referred to in item 2.9;

(14) information on other activities which may present a Conflict of interest, if applicable;

(15) record of customer claims and corrective actions, where applicable;

(16) any legal proceedings against the company in the past/currently in the courts of law, where applicable.

2.2 Quality management system

2.2.1 The NDT Service Supplier shall have a documented quality management system, covering at least:

(1) work procedures for all tasks and operations, including the various NDT methods and NDT techniques for which the NDT Service Supplier is involved;

(2) preparation, issuance, maintenance and control of documents;

(3) maintenance and calibration of the equipment;

(4) training programs for the NDT operators and the supervisors;

(5) maintenance of records for NDT operators’ and the supervisors’ training, qualification and certification;

(6) certification of NDT operators including re-validation and recertification;
(7) procedure for test of operators' visual acuity;
(8) supervision and verification of operation to ensure compliance with the NDT procedures;
(9) quality management of subsidiaries;
(10) job preparation;
(11) order reference system where each engagement is traceable to when, who and where the test was carried out;
(12) recording and reporting of information, including retention time of records;
(13) code of conduct for the NDT Service Supplier's activities; especially the NDT activities;
(14) periodic review of work process procedures;
(15) corrective and preventive action;
(16) feedback and continuous improvement;
(17) internal audits;
(18) the provision of accessibility to required codes, standards and procedures to assist NDT operators.

2.2.2 A documented quality system complying with the most current version of ISO/IEC 17020:2012 and including the above would be considered acceptable. The NDT Service Supplier should satisfy the requirements of Type A or Type B or Type C inspection body, as described in ISO/IEC 17020:2012. In all cases, production staff shall not be allowed to inspect their own work in the case of Type C inspection body.

2.3 Qualification and certification of NDT personnel

2.3.1 The NDT Service Supplier is responsible for the qualification and preferably 3rd party certification of its supervisors and operators to a recognised certification scheme based on ISO 9712:2021.

2.3.2 Personnel qualification to an employer based qualification scheme as e.g. SNT-TC-1A, 2020 or ANSI/ASNT CP-189, 2020 may be accepted if the NDT Service Supplier's written practice is reviewed and found acceptable by the Society. The NDT Service Supplier's written practice shall as a minimum, except for the impartiality requirements of a certification body and/or authorised body, generally comply with the requirements of ISO 9712:2021.

For NDT operators holding certificates issued via an employer based scheme, the employer's certification shall be deemed revoked when employment is terminated by either party.

2.3.3 The supervisors' and operators' certificates and competence shall comprise all industrial and product sectors and techniques being applied by the NDT Service Supplier.

2.3.4 Level 3 personnel shall be certified by one of the following means:
(1) obtain certification from an accredited certification body.
(2) obtain certification from an employer based scheme via the examination method, as detailed in the written practice. It is not permissible to directly appoint a level 3 without examination if the intended certification route is from an employer based scheme.

2.4 Supervisor

The NDT Service Supplier shall have a supervisor or supervisors, responsible for the following:
(1) validate NDT instructions and procedures established and reviewed by level 3 personnel;
(2) review of NDT reporting;
(3) supervise all tasks and NDT operations at all levels;
(4) inspection of NDT equipment, tools and calibration;
(5) re-evaluate the qualification of the operators annually on behalf of the NDT Service Supplier.

Normally, the NDT Service Supplier shall employ (on a full-time basis) a level 3 supervisor, certified to level 3 in the applicable method(s) as per the requirements of this Appendix.

It is recognised that an NDT Service Supplier may not directly employ a Level 3 in all the stated methods practiced. In such cases, it is permissible to employ an external Level 3 who is certified by an accredited certification body in those methods not held by the full-time Level 3(s) of the NDT Service Supplier.

Alternatively, and by agreement with CCS, the NDT Service Supplier may appoint an internal (full-time employed) supervisor of NDT activities, who does not hold level 3 certification. In this case, the supervisor shall be certified to a minimum of level 2. For NDT Service Suppliers operating this alternative approach, the NDT Service Supplier shall comply with all other requirements of this Appendix and shall employ (either part time or on a contract basis) Level 3 NDT Services (to carry out functions such as procedure development, procedure approval, consultancy, review etc.) from outside the NDT Service Supplier organisation. The appointed external level 3 shall be certified by an accredited certification body in all the applicable methods appropriate to the scope of the NDT operations.

2.5 Operators

2.5.1 The operator carrying out the NDT and interpreting indications, shall as a minimum, be qualified and certified to Level 2 in the NDT method(s) concerned and as described in item 2.3. However, operators

only undertaking the gathering of data using any NDT method and not performing data interpretation or data analysis may be qualified and certified as appropriate, at level 1.

2.5.2 The operator shall have adequate knowledge of materials, weld, structures or components, NDT equipment and limitations that are sufficient to apply the relevant NDT method for each application appropriately.

2.6 Equipment

2.6.1 The NDT Service Supplier shall maintain records of the NDT equipment used and detail information related to maintenance, calibration and verification activities. If the NDT Service Supplier hires equipment, such equipment shall have updated calibration records, and the operators shall be familiar with the specific equipment type prior to using it. Under any circumstance, the NDT Service Supplier shall possess sufficient equipment to carry out the services being a part of the NDT scope required by CCS.

2.6.2 Where the equipment is of unique nature, the NDT operators shall be trained by competent personnel in the operation and use of the equipment before carrying out NDT using this equipment.

2.7 Work instructions and procedures

The NDT Service Supplier shall produce written procedures for the NDT being applied. These procedures are to be written, verified or approved by the NDT Service Supplier's Level 3(either internal, or external, as described in section 2.4). Procedures shall define all relevant information relating to the inspection including defect evaluation against acceptance criteria in accordance with the Society Rules. All NDT procedures and instructions shall be properly documented in such a way that the performed testing can be easily retraced and/or repeated at a later stage. All NDT procedures are to be acceptable to CCS.

2.8 Sub-contractors

2.8.1 The NDT Service Supplier shall give information of agreements and arrangements if any part(s) of the services provided are subcontracted, included level 3 NDT Services (as described in section 2.4). The NDT Service Supplier, in the following-up of subcontracts shall give emphasis to the quality management system of the subcontractor.

2.8.2 Subcontractors shall meet the same requirements placed on NDT Service Suppliers for any NDT performed.

2.9 Reporting

2.9.1 All NDT shall be properly documented in such a way that the performed testing and examination can be easily retraced and/or repeated at a later stage. The reports shall identify the defects present in the tested area, and a conclusive statement as to whether the material, weld, component or structure satisfies the acceptance criteria or not.

2.9.2 The report shall include a reference to the applicable standard, NDT procedure and acceptance criteria applied in the applicable NDT method/technique. In general, the acceptance criteria shall comply with the Society Rules. Reports shall be signed by the personnel with the appropriate level of certification, and the appropriate signatory status as defined in the Quality Management System.

Appendix 24 REMOTE CLASSIFICATION SURVEYS

1 General

The survey of ships may utilize different methods and concepts. This Appendix contains principles and minimum requirements for carrying out remote surveys.

Remote survey will only be appropriate provided the level of assurance is not compromised, and the survey is carried out with the same effectiveness as and is equivalent to, a survey carried out with attendance on board by a Surveyor.

1.1 Application

These requirements apply to all vessels, self-propelled or not. These requirements are not mandatory for offshore units.

1.2 Definitions

1.2.1 Remote Survey

A "Remote Survey" is a process of verifying that a ship and its equipment are in compliance with the rules of the Classification Society where the verification is undertaken, or partially undertaken, without attendance on board by a surveyor.

1.2.2 Information and Communication Technology (ICT)

Information and Communication Technology (ICT) are the technologies used in the scope of remote surveys for gathering, storing, retrieving, processing, analysing, and transmitting information which includes both software and hardware

Notes:

1 'Attendance on board by a surveyor' means physical attendance on board the ship by a surveyor.

2 Remote classification activities not requiring a survey, such as some administrative tasks, are not to be considered as remote surveys.

3 An administrative task is a task where a survey decision is not being made, for example reissue of a certificate or record following a correction, or an update to the ship's records held by CCS or a document review.

2 Requirements for equivalency

The requirements for equivalency of a remote survey to a survey attended on board by a Surveyor include eligibility of the remote survey, qualification of Surveyors, planning of the remote survey, performance of the remote survey, assessment of the remote survey and reporting.

Equivalency is obtained when, with the use of available ICT, a surveyor can perform a survey remotely being able to:

- obtain the supporting and technical evidence required according to the applicable rules,
- verify applicable survey items and relevant tests,

and the results of the remote survey provide the same level of assurance obtained with attendance on board by a Surveyor.

2.1 Eligibility of the remote survey

2.1.1 Eligibility of the remote survey is to be decided based on type and scope of the requested survey, in accordance with 3.1 and, if applicable, flag State Administration acceptance and possible instructions, when the classification survey is also related to a statutory item, and CCS is carrying out the statutory survey on behalf of the flag State Administration.

2.1.2 A remote survey is deemed eligible when it provides the same level of assurance, according to the requirements for equivalency, as if it was conducted with attendance on board by a Surveyor.

2.1.3 Remote surveys are generally to be carried out with internet connection allowing a live streaming visual examination, although, at the discretion of the Surveyor, a combination of remote survey methods (see 2.4) may be used. For simple/limited verifications, other types of ICT may be accepted by the Surveyor.

2.2 Qualification and monitoring of Surveyors

2.2.1 Qualification

2.2.1.1 Surveyors engaged in remote surveys are to be qualified as per standard procedures for the type of ship and type of survey, i.e., in accordance with IMO RO Code (MSC.349(92)), IACS Procedural Requirement PR 7, and CCS training and qualification scheme.

2.2.1.2 Additional training is to be carried out, covering the ICT used for the remote survey, in relation to the applicable remote survey scope and methods, in order to fully qualify the Surveyor engaged in remote surveys.
2.2.1.3 The additional training required for qualification for remote surveys shall be in accordance with CCS procedures and shall provide:
(1) knowledge of the operation of CCS remote survey software, if applicable;
(2) knowledge of the technical and procedural aspects related to remote surveys;
(3) knowledge of the connectivity aspects related to remote survey.
2.2.2 Monitoring
2.2.2.1 The monitoring of a Surveyor qualified for remote surveys is to be carried out in accordance with IACS Procedural Requirement PR 6.
2.2.3 Surveyor's Record
2.2.3.1 Records of Surveyor's training and qualification for remote surveys shall be maintained and updated as per CCS standard procedures.
Notes:
1 CCS personnel engaged in remote classification activities not requiring a survey (refer to 1.2.1) are to be trained and qualified according to CCS standard procedures.
2 On board personnel/Crew:
- Training and qualification of on board personnel/Crew are regulated by the STCW Convention and is a prerogative of the flag State Administration.
- The ship's flag State Administration may require that the Safety Management System of the ship is updated by the Company to include provisions for specific training of the crew engaged in remote surveys.

2.3 Planning of the remote survey
2.3.1 Planning of the remote survey is required to ensure that the remote survey is carried out in accordance with the applicable requirements. The content of the planning shall be based on the scope of the remote survey
2.3.2 To ensure that the Surveyor can properly plan the remote survey and communicate with personnel/crew, so that the survey is carried out according to the applicable rules, adequate means are to be available enabling the Surveyor and allowing CCS to:
- properly interact with personnel/crew involved in the remote survey, before and during the survey process;
- agree on ICT means to be used;
- verify that personnel/crew involved in the remote survey are suitably skilled to use the electronic devices and/or software used by the Society to perform the remote survey;
- acquire as deemed necessary information on identity and ranking of personnel/crew involved in the remote survey;
- provide the survey item/scope to the personnel/crew involved in facilitating the remote surveys, including the tests that will be performed;
- communicate, during the remote survey, additional actions depending on the evidence to be collected.
2.3.3 One or more of the following means is to be provided for planning the remote survey:
- live-streaming video and audio connection;
- exchange of data / electronic documents;
- other means acceptable to CCS.
2.3.4 The owner is to provide the necessary facilities for the safe execution of the survey.

2.4 Performance of the remote survey
2.4.1 To ensure that the Surveyor can properly perform the remote survey according to the applicable rules, the available evidence must allow the attending surveyor to:
- examine and assess a survey item and/or a group of items and/or supporting documents;
- verify and assess applicable tests and/or services.
2.4.2 The evidence provided to the Surveyor is subject to the technical evaluation and final acceptance by the Surveyor with respect to the completeness and accuracy, necessary to perform the requested survey according to the applicable requirements.
2.4.3 One or more of the following evidence is to be provided for performing the remote survey:
- live-streaming video and audio;
- recorded videos provided by the Owner's representative;
- photos provided by the Owner's representative;
- other data and/or supporting documents acceptable to CCS.

2.5 Assessment of the remote survey

2.5.1 The Surveyor shall evaluate all evidence received and accept them before crediting the remote survey.

2.5.2 The means used for the remote survey must allow the Surveyor to collect the necessary evidence that will be examined according to the Surveyor's professional judgement in order to satisfactorily complete and credit the relevant survey items.

2.5.3 In case the Surveyor, according to their professional judgement, deems that the remote survey does not provide the same level of assurance as a survey with attendance on board by a Surveyor, the Surveyor may decide not to credit the relevant survey items.

3 Scope and procedures

A remote survey will be only appropriate provided it reaches the same level of assurance as, and is equivalent to, a survey attended on board by a Surveyor.

3.1 Scope - Eligible survey items

3.1.1 A remote survey may be proposed as an alternative to a survey attended on board by a Surveyor for the surveys listed in Table 1.

3.1.2 When the classification survey is also related to a statutory item, and CCS is carrying out the statutory survey on behalf of the flag State Administration, then the flag State Administration acceptance is required, and possible additional requirements are to be complied with.

3.1.3 The Surveyor may require to confirm the results of the remote survey, by a survey attended on board by a Surveyor, to credit the relevant survey items, in case the remote survey is not carried out to the Surveyor's satisfaction or it is required by CCS.

Table 1: Eligible remote survey items

No.	Surveys and related items eligible to remote survey	Live streaming required (See Notes)
1	Postponement, issuance, deletion of Condition of Class	X (1)
2	Postponement of Class surveys	X (1)
3	Items of Continuous Survey for Machinery (UR Z18) or Planned Maintenance Scheme (UR Z20, PMS)	X (1)
4	Occasional survey for change of ship's name	X (1)
5	Occasional survey for loss of anchor	X (1)
6	Occasional survey for minor machinery or equipment damage	X (1)
7	Occasional survey for minor hull damage	X (1)
8	Occasional survey for minor deficiencies/defects not subject to a Condition of Class	X (1)
9	In-water bottom survey	X
10	Specified items of a class periodical survey (excluding additional specific items of initial or renewal surveys), including completion of remaining items of a part held class periodical survey	X (1)(2)
11	Non-propelled / un-manned barges/pontoon – annual surveys when no survey of hull compartments is due	X
12	Minor retrofit / installation/upgrade of equipment	X (1)
13	Documentary or data based initial / periodical / renewal / occasional verifications and surveys	

Notes:

1 "(1)" means that live streaming may not be required for minor survey scope or that a combination remote survey method, as listed in 2.4, may be used at the sole discretion of CCS.

2 (2)" means that pure documentary verifications are eligible in accordance with item 13.

3 Live streaming may be required for surveys not marked X in the Table, depending on the survey scope at the sole discretion of CCS.

4 "Minor" in the items 6, 7, 8 and 12 means that the item can be surveyed remotely according to requirements for equivalency given in 2

3.2 Procedures

3.2.1 Eligibility: Refer to 2.1.

3.2.2 Digital information quality, completeness, and accuracy

3.2.2.1 Final appraisal of the quality of digital information is at the discretion of the Surveyor, who is to be satisfied with the content and the quality of digital information collected, and the survey carried out, allowing the Surveyor to confirm its completion.

3.2.2.2 The Owner is responsible for the completeness and accuracy of digital information provided. The

digital information submitted by the Owner to the Surveyor is to reflect the real situation of the surveyed item. The date and time, when a photo or video was taken are to be made available to the Surveyor or identifiable from its metadata.
3.2.2.3 CCS is to collect and store digital information as evidence of the survey. It is not necessary to store all of digital information received; the exact digital information stored shall support the survey decision and is to be decided by the Surveyor crediting the survey.
3.2.2.4 The remote survey is carried out under the supervision and upon instructions of the Surveyor, who is in charge of crediting the remote surveys. A surveyor attendance on board may be required to complete the survey, upon the Surveyor's request and at their discretion.
3.2.3 Requirements for a remote survey when live streaming is not used
3.2.3.1 When live streaming is not used, communication and digital information collection are to be performed through an ICT channels (such as emails, data streams and clouds), which is to be accepted by CCS prior to the survey.
3.2.3.2 The Owner’s representative is to confirm the identity of the ship at the commencement of the survey.
3.2.4 Requirements for a remote survey when live streaming is used
3.2.4.1 The Owner’s is to ensure that:
- the Owner’s representative is attending onboard and has access to the areas intended to be surveyed;
- the Owner’s representative has at his disposal a 2-ways visual and audible communication means complying with the requirements in 4;
- ICT solution is available on the communication means and meets the requirement described in 4.
In the case these requirements cannot be fulfilled, the remote survey may be rejected. The Surveyor is to verify the identity of the ship at the commencement of the survey by live streaming.

3.3 Hardware and ICT solution
Refer to 4.1.

3.4 Requirements for Connectivity
3.4.1 The Owner’s representative is to ensure that internet connectivity tests are carried out before the survey and that proper connectivity is available and maintained during the survey.
3.4.2 When remote survey by live streaming is being undertaken, a connection that enables live streaming between the Surveyor and the Owner’s representative attending on board is required. The quality of the live streaming connection (audio and video) is to ensure proper communication and to allow the Surveyor to carry out the survey remotely, to the Surveyor's satisfaction. In the case where a live streaming connection with the Surveyor is not possible or is not continuous at the place of the survey (e.g., Engine Room), partly online sequences (where the Owner is able to capture pictures and videos offline of those items not covered by live streaming) may be accepted by the Surveyor.

4 Information and Communication Technology (ICT)
This section outlines the minimum requirements for the use of ICT that can capture images, record video and/or live stream video or other data from a ship as considered acceptable to CCS.

4.1 Hardware
4.1.1 The Owner is responsible for ensuring that all hardware installations on board used for the remote survey shall comply with the applicable requirements relevant for use and location on board, including hazardous areas. The ICT shall typically consist of:
- A host computer device, to receive the streaming of images/data/video. This is usually a laptop or desktop computer compatible with the software application used for the remote survey;
- On board standalone device which may include digital cameras capable of capturing videos/photos/data;
- On board smart device compatible with the applicable software/technology;
- Communication accessories like headphones and microphone for the noisy environment as applicable and as deemed necessary.

Notes: The smart device may be a smartphone, tablet, computer, wearable device, smart glass, digital camera, or any other device which can be connected to the network and capable of transmitting the necessary data/images to shore.

4.1.2 The communication equipment used for the live streaming shall have the following minimum functionality:
- both ends shall simultaneously see the same image/videos in near real-time (i.e., live streaming);
- two-way direct voice communication;

- possibility to take screenshots.

4.1.3 When using a portable device on board for live streaming, the movement of the handheld device may affect the stability of the video and the image, leading to lower quality outputs. When necessary, a suitable anti-shake device shall be used to provide proper stability.

Notes:

1 The host computer screen is to be able to present an image quality that is sufficient to enable a survey decision to be made.

2 Portable equipment on board shall be equipped with a power capacity suitable for the intended scope and time of the survey.

4.2 Internet Connectivity (coverage and speed)

4.2.1 For internet connectivity requirements on board, refer to 3.4.

4.2.2 The on board smart devices shall have the capability of transmitting the images/video/data over a Cellular, Wi-Fi or Satellite Connection to the remote Surveyor.

4.2.3 When live streaming communication is applied, the internet connection shall have sufficient and stable bandwidth capacity to ensure quality (such as resolution and frame rate) of the direct colour image/video and voice communication to the remote survey location to the satisfaction of the Surveyor.

4.3 Software and data security:

4.3.1 The software used for the remote survey is to be acceptable to CCS. The overall function and ability of the software used to ensure the security of data shall be evaluated prior to use as per the below requirements.

4.3.1.1 The Surveyor shall normally control the live video call, providing instructions to the on-site personnel/crew and supervising survey activities for capturing relevant information. The on board device shall have the capability of transmitting the data over a Cellular, Wi-Fi, or Satellite Connection to the Surveyor.

4.3.1.2 The software used to perform the remote survey may also be provided with technologies that support the Surveyor in the process of making a decision, such as:

- Artificial Intelligence (AI) for the recognition and the classification of defects,
- Internet of things (IoT) for collecting parameters and evaluating acceptability/working condition of machinery and equipment,
- Data driven verification or other means considered acceptable by CCS.

4.3.1.3 The above software and technologies are to be evaluated and accepted by CCS in each case.

4.3.2 When considering the use of software/applications and other technologies, data protection shall be considered in accordance with applicable requirements of CCS before the remote survey is commenced. The software/application used to perform the remote survey is to be compatible with the technical requirements detailed in this paragraph; in addition, the software used is to comply with CCS applicable requirements for:

- cybersecurity;
- data protection and confidentiality for the transmitted data.

4.3.3 When not provided by CCS itself, the audio/video software or application used to perform the remote survey is to be accepted by CCS.

4.3.4 During the survey preparation, it is the Owner’s responsibility to ensure that their data security policies are implemented as per the Company's Safety Management System.

Notes: The Company’s SMS may take into account IMO resolution MSC.428(98), MSC-FAL.1/Circ.3 and IACS Rec.166.

5 Recording of evidence and reporting of survey

5.1 Recording of Evidence

5.1.1 Required evidence (refer to 2.4)

In principle, live streaming video and audio shall be applied to remote surveys as a primary means (refer to Table 1 in 3.1). Additionally, and/or alternatively, one or more of the following evidence may be submitted or verified as requested by the Surveyor during remote survey so that the Surveyor is able to verify conditions of survey items:

- Recorded video and audio;
- Photos;
- Master's/chief engineer's statement;
- Ship's logbook;
- Owner’s confirmation.

5.1.1.1 Live streaming video and audio: Live streaming video and audio using ICT shall be in accordance with the requirements in 4.

5.1.1.2 Recorded videos/photos

For the recorded videos/photos, the following information is to be available:

- confirmation that they were actually taken on the ship by the Owner’s representative;
- date and time when they were taken;
- identity of the personnel/crew responsible for taking evidence.

5.1.1.3 Master's/chief engineer's statement

Recorded videos/photos provided by the Owner’s representative may be supplemented with a statement signed by the master and/or the chief engineer confirming the condition of the items shown in the evidence. The final evaluation of the remote survey by the Surveyor is to be based on all of the provided evidence, and it does not delegate the responsibility to the master/chief engineer’s statement only.

5.1.1.4 Ship's logbook

The Master shall make entries into ship's logbook on the following occasions and submit copies of the relevant pages when requested by the Surveyor:

- when a remote survey is carried out by the Surveyor;
- when videos/photos are taken and submitted to the Surveyor with the master's/chief engineer's statement and additional documents as applicable.

5.1.1.5 Owner’s confirmation

The Owner’s representative or the master is to confirm the correctness and completeness of the provided information and evidence (if any) relevant to the condition of the items requested to be surveyed. This confirmation may be included in the survey application.

5.1.2 Retaining/filing evidence

5.1.2.1 The evidence submitted by the Owner’s representative or master shall be retained/filed in accordance with CCS procedures which shall include:

- type of evidence to be retained/filed;
- duration/location to be retained/filed.

5.1.2.2 It is not required for CCS to record and save live streaming video and audio as evidence unless the Surveyor considers it necessary.

5.1.3 Other supporting documents

5.1.3.1 The Surveyor may request the Owner’s representative or master to submit supplementary documents such as ship's maintenance reports and record for the operation of machinery, and equipment and service reports issued by manufacturers, service suppliers or service providers.

5.1.3.2 While the Surveyor shall verify that the documents are duly prepared and issued to the ship, they may not be required to be retained/filed by CCS as evidence.

5.2 Reporting of remote survey

5.2.1 The report of a remote survey shall be issued in accordance with CCS procedure. The survey report shall also include the following additional information:

- indication that the survey was carried out remotely;
- description of the means used during the remote survey;
- indication of the provided evidence;
- confirmation of the flag State Administration’s authorization, when applicable.

CHAPTER 6 SURVEYS RELATED TO CLASS NOTATIONS

Section 1 GENERAL PROVISIONS

6.1.1 General requirements

6.1.1.1 The purpose of this Chapter is to give details on the scope of surveys related to class notations assigned to ships for special duties, special equipment, machinery and environmental protection. The scope of these surveys covers specific requirements to be complied with for the maintenance of the relevant additional class notations.

6.1.1.2 These specific requirements are additional to those laid down for surveys of all ships in Chapter 5 of this PART. These surveys may be carried out concurrently with the surveys of the same type, i.e. the annual, intermediate or special survey.

6.1.2 Class notations subject to additional surveys

6.1.2.1 The specific requirements detailed in this Chapter are linked to the class notation(s) assigned to the ship. Where a ship has more than one class notation, the specific requirements linked to each class notation are applicable.

6.1.2.2 The owner is to promptly notify CCS of any change, damage or failure of the equipment and systems having a class notation that affects the maintenance of the notation, and apply for an occasional survey.

Section 2 SURVEYS RELATED TO CLASS NOTATIONS FOR SPECIAL DUTIES

6.2.1 General requirements

6.2.1.1 The general requirements for surveys during and after construction as specified respectively in Chapters 4, 5 of this PART and in addition, the relevant survey requirements specified in this Section are to be complied with.

6.2.2 Fire-fighting ships

6.2.2.1 General requirements

(1) This paragraph applies to fire-fighting ships having one of the following class notations:

① Fire-fighting ships of Grade 1: Fire Fighting Ship 1;

② Fire-fighting ships of Grade 2: Fire Fighting Ship 2;

③ Fire-fighting ships of Grade 3: Fire Fighting Ship 3.

6.2.2.2 Initial classification

(1) A ship applying for one of the class notations for fire-fighting ships is to submit, above all, the plans and documents required by 1.1.3 of Chapter 1, PART EIGHT of the Rules.

(2) During survey of a fire-fighting ship under construction, hull, stability, propulsion machinery, equipment, fire protection and fire-fighting systems, electrical installations are to be inspected, and all installed devices and equipment are to be tested in working condition for confirming compliance with Chapter 1, PART EIGHT of the Rules.

6.2.2.3 Annual surveys

(1) Fire protection of ship:

① overall examination of the arrangement of structural fire protection;

② pipelines and nozzles of water spray systems are to be tested with compressed air for unimpeded passage, and pipelines and operating valves externally examined.

(2) Water monitor system:

① external examination of pipelines, valves, fire pumps, etc. of the system;

② examination of the system for normal working;

③ examination of seating arrangements and manual control of monitors.

(3) Fixed foam monitor system:

① The foam concentrate tank is to be examined externally and no serious corrosion or rotting-out is allowed; the level of the tank is to be checked, and stored foam concentrate is also to be examined.

Control valves are to be tested operationally, all foam generators and distribution pipelines are to be tested for unimpeded water flow and no blockage of any pipeline, nozzle or foam generator is allowed.

② The foam containers of mobile fire-fighting equipment provided on fire-fighting ships of Grades 2, 3 are to be examined externally, and pipelines, nozzles and foam generators are to be tested for unimpeded passage.

6.2.2.4 Intermediate surveys

The requirements for intermediate surveys are the same as those for annual surveys.

6.2.2.5 Special surveys

(1) The special survey is to be carried out in accordance with 6.2.2.3 above and in addition, to cover the following:

① an appropriate nozzle of the water spray system is to be selected for effectiveness test;

② an effectiveness test of the water monitor system is to be performed, and the minimum range of monitors is to be as required by Table 1.1.1.3 of Chapter 1, PART EIGHT of the Rules;

③ random check of foam concentrate of the fixed foam monitor system and the mobile fire-fighting equipment.

6.2.3 Oil recovery ships

6.2.3.1 General requirements

(1) This paragraph applies to oil recovery ships having one of the following class notations:

① Oil Recovery Ship with Cargo Tank;

② Oil Recovery Ship without Cargo Tank;

③ Oil Recovery Ship not suitable for products with a flash point of 60℃ and less.

(2) The following documents are to be available on board:

① operating manual;

② overhaul records for gas detection and alarm system.

6.2.3.2 Initial classification

(1) Submission of plans and documents

① For any newbuilding, the classification survey of which is intended, the plans and documents specified in Chapter 3 of PART EIGHT are to be submitted to CCS for approval.

② For any oil recovery ship constructed not under the supervision of CCS, the classification survey of which is intended, the plans and documents listed in Chapter 3 of PART EIGHT are to be submitted in addition to those required by Section 14 of Chapter 5 of this PART.

(2) Survey

① Upon completion of construction of the ship, operation test and simulated operation of the oil recovery equipment are to be carried out.

② Operation test of the oil recovery equipment is to be carried out during the initial classification of existing ships.

6.2.3.3 Annual surveys

(1) Checking the recovered oil transfer system, and checking ballast systems and bilge systems etc. in hazardous areas; confirming that they are in effective condition.

(2) Checking the venting system of recovered oil tanks and other ventilation systems in the hazardous area; confirming that they are in effective condition.

(3) Confirming that air lock (if fitted) is in effective condition.

(4) Confirming that the gas detection and alarm system and the portable gas detection equipment are in effective condition.

(5) Confirming that no potential sources of ignition are present in or near the recovered oil transfer pump room and that access ladders are in good condition.

(6) Examination of bulkheads of the recovered oil transfer pump room for signs of leakage or fractures, and in particular, the sealing arrangements of all penetrations in these bulkheads.

(7) Confirming that installed pressure gauges on recovered oil transfer piping and level indicator systems of recovered oil tanks are operational.

(8) Examination, so far as practicable, of pumps in the recovered oil transfer pump room for excessive gland seal leakage; verification of proper operation of electrical and mechanical remote operating and shutdown devices.

(9) Examination of the fixed fire-fighting system for the recovered oil transfer pump room, and confirming, as far as practicable and when appropriate, the operation of the remote means for closing the various

openings.
(10) Overall survey of recovered oil tanks. Where the tank is adjacent to the engine room, the bulkhead is to be subjected to a close-up survey to confirm that there are no signs of leakage or fractures.
6.2.3.4 Intermediate surveys
(1) The items specified for annual surveys.
(2) Effectiveness test as required by the Surveyor if deemed necessary.
(3) Where a tank adjacent to the engine room is intended for the storage of recovered oil, the tank is subject to pressure test.
(4) For weather decks, an examination as far as applicable of recovered oil transfer, bunker, ballast, steam and vent piping systems is to be carried out. If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, thickness measured or both.
6.2.3.5 Special surveys
(1) The special survey is to cover the items specified for intermediate surveys.
(2) The recovered oil transfer system, and ballast systems and bilge systems etc. in hazardous areas are to be operationally tested to working pressure, confirming that their tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in oil recovery tanks and recovered oil transfer piping in ballast tanks and void spaces.

6.2.4 Pusher tug-barge combinations

6.2.4.1 General requirements
(1) This paragraph applies to pusher tug-barge combinations having one of the following class notations:
① Rigidly connected pusher tug-barge combination:
Pusher tug: Rigid Connection PB Combination – Pusher;
Barge: Rigid Connection PB Combination – Barge.
② Pusher tug-barge combination connected in articulated manner:
Pusher tug: Articulated Connection PB Combination – Pusher;
Barge: Articulated Connection PB Combination – Barge.
(2) The surveys of the pusher tug and barge in a combination, carried out respectively as for a single ship, are to comply with the requirements in this Chapter for the same ship type.
6.2.4.2 Initial classification
(1) For any pusher tug-barge combination, the initial classification survey of which is intended, the plans and documents specified in Chapter 7 of PART EIGHT are to be submitted to CCS for approval.
(2) 6.2.4.1(2) is to be complied with and in addition, the connector including associated equipment and control system are to be examined and tested after they are installed.
6.2.4.3 Annual surveys
(1) The connector including associated equipment and control system are to be examined to confirm that they are in an effective condition;
(2) The hull structural condition in the periphery of the connector is to be confirmed.
6.2.4.4 Intermediate surveys
The requirements for intermediate surveys are the same as those for annual surveys.
6.2.4.5 Special surveys
The special survey is to include the requirements of 6.2.4.3 and in addition, the following:
(1) The connector including associated equipment and control system are to be examined and tested to confirm that they are in an effective condition.
(2) Confirming corrosion, deformation and damage of the hull structural condition in the periphery of the connector.

6.2.5 Petroleum asphalt carriers

6.2.5.1 General requirements
(1) This paragraph applies to petroleum asphalt carriers having one of the following class notations:
① Petroleum asphalt carriers fitted with independent tanks:
Asphalt Carrier (Independent tank, Max. cargo temperature ≤ ××× ℃)[①], F. P.>60℃;
② Petroleum asphalt carriers fitted with integral tanks:
Asphalt Carrier (Integral tank, Max. cargo temperature ≤ ××× ℃)[①], F. P.>60℃, ESP.
(2) Any petroleum asphalt carrier intended to be classed is to be surveyed in accordance with the relevant requirements of Chapters 4, 5 of this PART and this Chapter.

---

① ×××℃ in the notation represents highest design temperature for cargo.

(3) When the survey is carried out according to the relevant requirements of the Rules, the inside surface of cargo tanks (including independent tanks and integral tanks) dedicated in carrying petroleum asphalt need not be inspected.

6.2.5.2 Initial classification of newbuildings

(1) For any newbuilding, plans and documents are to be submitted for approval and/or examination in accordance with Chapter 10 of PART EIGHT of the Rules.

(2) The hull under construction is to be surveyed and tested in accordance with Chapter 4 of this Part. For the welding and tightness test of independent tanks, the requirements for deep tanks may be referred to. Tightness test method may be determined depending on the design mode of the independent tank, and tightness test of the independent tank is to be completed prior to laying the heat-insulating material.

(3) In construction of an asphalt carrier fitted with independent tanks, if the main deck is large opened, measures to prevent hull deformation are to be taken by the shipyard.

(4) The arrangement of supporting means of the independent cargo tank is to be inspected.

(5) The arrangement of longitudinal and transverse limiting devices of the independent tank is to be inspected.

(6) The installation of anti-flotation arrangements of the independent tank is to be inspected.

(7) The laying of heat-insulating material on the independent tank and thermal oil pipeline is to be inspected.

(8) The installation positions of monitoring alarms and sensors related to liquid cargo are to be inspected for compliance with the requirements of approved drawings. The connecting cables of sensors in cargo tanks are not to contact with liquid cargo.

(9) Effectiveness test may be carried out for monitoring alarms related to liquid cargo by means of simulation.

(10) Effectiveness test is to be carried out to bilge well high-level alarm in hold space.

(11) Survey and test are to be carried out for installation of thermal oil boiler (or thermal oil heater) and automated part therein.

6.2.5.3 Initial classification of existing ships

(1) Converted asphalt carriers are to be subject to an initial classification survey according to the requirements of 6.2.5.2 of this Chapter, in addition to the survey as required by Section 15, Chapter 5 of this PART.

(2) Existing asphalt carriers constructed not under the supervision of CCS are to be surveyed according to the relevant requirements of Section 14, Chapter 5 of this PART and in addition:

① evaluated according to plans and documents submitted as required by 6.2.5.2(1) of this Chapter;

② surveyed according to the relevant requirements of 6.2.5.4 of this Chapter depending on the age of ships.

(3) For integral tank asphalt carriers converted from other ships and carrying asphalt with temperature over 180℃, thermal stress analysis data of hull structural members are to be submitted for check.

6.2.5.4 Annual surveys

(1) For asphalt carriers fitted with independent tanks, in addition to the applicable items as specified in 5.4.2 and 5.6.3 of Chapter 5 of this PART, the following items are to be inspected:

① checking the records of monitoring alarm related to liquid cargo;

② checking the monitoring records of bilge well high-level alarm in hold space.

(2) For asphalt carriers fitted with integral tanks, in addition to the applicable items as specified for oil tankers in Chapter 5 of this PART, the item of 6.2.5.4(1)① is to be included.

6.2.5.5 Intermediate surveys

(1) For asphalt carriers fitted with independent tanks, in addition to the applicable items as specified in 6.2.5.4(1) of this Chapter, the following items are to be inspected:

① a number of monitoring points, as small as practicable, is to be selected for various monitoring alarms related to liquid cargo and tested by means of simulation for effectiveness;

② bilge well high-level alarm in hold space is to be tested for effectiveness.

(2) For asphalt carriers fitted with integral tanks, in addition to the applicable items as specified for oil tankers in Section 6, Chapter 5 of this PART, the items of 6.2.5.4(1)① and 6.2.5.5(1)① above are to be included.

6.2.5.6 Special surveys

(1) For asphalt carriers fitted with independent tanks, in addition to the applicable items as specified in 6.2.5.5(1) of this Chapter, the following items are to be inspected:

① examining the locating devices of the independent tank and adjacent components;

② confirming that heat-insulating material of the independent tank is in good condition;

③ confirming that anti-flotation arrangements of the independent tank are in good condition.

(2) For asphalt carriers fitted with integral tanks, in addition to the applicable items as specified for oil tankers in Section 6, Chapter 5 of this PART, the items of 6.2.5.4(1)① and 6.2.5.5(1)① above are to be included.

6.2.6 DP notation

6.2.6.1 General requirements

(1) This paragraph applies to ships which have been assigned one of the following class notations related to dynamic positioning systems:

① DP – 1;

② DP – 2;

③ DP – 3.

6.2.6.2 Initial classification

(1) For a ship intended for the notation DP, the plans and documents required by 11.1.4 of Chapter 11, PART EIGHT of the Rules are to be submitted for approval.

(2) The survey of the ship during construction is to include examinations and tests of the following items:

① The control system of DP system and relevant reference system are to be subjected to type approval in accordance with Chapter 3 of this PART to demonstrate that they are in compliance with the requirements of Chapter 11, PART EIGHT of the Rules, suitable for the environmental conditions at sea and issued a Marine Products Certificate, including the following systems:

a. dynamic positioning control system (including computer system);
b. an independent joystick system with automatic heading control;
c. positioning reference system.

② Checking Marine Products Certificates of relevant equipment.

③ Confirming that the equipment and arrangement of DP system is in compliance with the approved plans and Chapter 11, PART EIGHT of the Rules.

④ All sensors, peripheral equipment and reference systems are to be tested before the test of the whole DP system. Alarm system and logical conversion are to be calibrated by simulating the failure of sensors.

⑤ The following tests are to be carried out to thrusters:

a. function test to control and alarm systems of each thruster;
b. test of signal exchanges between each thruster and DP system computer;
c. test of different control methods of the thruster.

⑥ Test is to be carried out to the capacity of the UPS batteries.

⑦ Test is to be carried out to all functions of the independent joystick system.

⑧ The following tests are to be carried out to the whole set of DP system:

a. test to system functions in all operational modes;
b. test to conversion method, back-up system and alarm system;
c. positioning is to be performed on all possible combinations of position reference systems (PRSs), and on each PRS as a single system. Selecting and de-selecting of PRSs are also to be tested;
d. test to manual override function under normal operation and failure conditions;
e. continuous site test for at least 6 to 8 hours to the whole set of automatic system and any failure occurred is to be recorded and analyzed;
f. the whole DP system is to be tested for at least 2 hours under specified environmental conditions. Weather conditions are to be such as to make the average thruster load level reach 50% or higher. Where the environmental conditions can not satisfy such requirement, the test may be carried out as a special test later on an appropriate occasion.

⑨ For steering gears included under DP-control, a test is to be carried out to verify that maximum design temperature of actuator and all other steering gear components is not exceeded when the rudder is continuously put over from border to border within the limits set by the DP-control system, until temperature is stabilized.

⑩ For class notations DP-2 and DP-3, FMEA test is to be carried out in accordance with approved FMEA test procedures. The FMEA test is to be based on the simulation of failures and is to be performed under as realistic conditions as practicable.

6.2.6.3 Annual surveys

(1) The apparatus such as generator and thruster system related to DP system are to be surveyed in accordance with the requirements of the main class.

(2) It is to be confirmed that the DP system has been normally maintained in good working order.

6.2.6.4 Special surveys

(1) The following tests are to be carried out to thrusters:

① function test to control and alarm systems of each thruster;

② test of signal exchanges between each thruster and DP system computer;

③ test of different control methods of the thruster.

(2) Test is to be carried out to all functions of the independent joystick system:

① tests to conversion method, back-up system and alarm system with all operation modes and in various simulated failure conditions;

② test to manual override function under normal operation and failure conditions;

③ continuous site test for at least 6 to 8 hours to the whole set of automatic system and any failure occurred is to be recorded and analyzed;

④ the whole DP system is to be tested for at least 2 hours under specified environmental conditions. Weather conditions are to be such as to make the average thruster load level reach 50% or higher. Where the environmental conditions can not satisfy such requirement, the test may be carried out as a special test later on an appropriate occasion.

(3) The following tests are to be carried out to the whole set of DP system:

① test to system functions in all operational modes;

② test to conversion method, back-up system and alarm system;

③ positioning is to be performed on all possible combinations of position reference systems (PRSs), and on each PRS as a single system. Selecting and de-selecting of PRSs are also to be tested;

④ test to manual override function under normal operation and failure conditions;

⑤ continuous site test for at least 6 to 8 hours to the whole set of automatic system and any failure occurred is to be recorded and analyzed.

6.2.6.5 Survey to alteration of DP system

(1) Where a major alteration is made to the hardware or software of the DP system (i.e. adding a position reference system, installing more or different thruster(s) or adding a different control method, changes in power system, structural changes etc.), the owner or the entrusted shipyard is to advise CCS in a timely manner. CCS will consider the need for a re-survey or test.

Section 3 SURVEYS RELATED TO CLASS NOTATIONS FOR SPECIAL EQUIPMENT AND SYSTEM

6.3.1 Helicopter Facilities notation

6.3.1.1 Application

(1) This paragraph applies to ships which have been assigned the following class notation:

① Helicopter Facilities.

6.3.1.2 Initial classification

(1) For a ship intended for the notation Helicopter Facilities, the plans and documents required by 5.1.3 of PART SIX of the Rules are to be submitted for approval, and the operation manual with information on models and parameters of helicopters to be used (including maximum takeoff weight, diameter of rotor, size of wheel print and tracking width) is to be submitted for information.

(2) During survey of the ship under construction, compliance of the arrangement of helicopter deck, the securing arrangements of helicopter and the fire safety system with the rules and approved plans are to be confirmed.

6.3.1.3 Annual surveys

(1) Helicopter deck and its supporting structure, securing arrangements, safety net, visual aids, etc. are to be generally examined to confirm that they are in good working condition.

(2) Means of access for inspections, including means of escape, are to be in good condition, free from obstructions and clearly marked.

(3) Confirming so far as practicable that no substantial change has been made to the fireproof structure and arrangement of the helicopter deck; fire-fighting appliances are to be examined externally to confirm that they are in good working condition and so located as required.

(4) Drainage, refueling and oil storage facilities (including earthing, emergency shutdown devices and oil leakage response means) are to be examined generally to confirm that they are in good working condition.

(5) Mechanical ventilation systems of the enclosed hangar facilities and any enclosed space in which

refueling equipment is located are to be examined to confirm that they are in good working condition.

6.3.1.4 Intermediate surveys

(1) The scope of the intermediate survey is the same as that of the annual survey.

6.3.1.5 Special surveys

(1) In addition to the above requirements for the annual survey, the special survey is to include the following:

① examination of the helicopter deck to confirm the continuing effectiveness of structural integrity;

② effectiveness test of fire-fighting appliances;

③ examination and test of electrical installations and associated ventilation systems within refueling area;

④ examination and test of earthing, emergency shutdown devices of refueling and oil storage facilities.

6.3.2 Equipped with Container Securing Arrangements notation

6.3.2.1 Application

(1) This paragraph applies to ships which have been assigned the following class notation:

① Equipped with Container Securing Arrangements.

6.3.2.2 Initial classification

(1) For a ship intended for the notation Equipped with Container Securing Arrangement, the plans and documents required by 1.3 of Appendix 1 of Chapter 7, PART TWO of the Rules are to be submitted for approval.

(2) During survey of the ship under construction, an overall survey of the materials, workmanship and arrangement of securing devices is to be carried out to confirm their compliance with Appendix 1 of Chapter 7, PART TWO of the Rules and the approved plans.

6.3.2.3 Annual surveys

(1) Confirmation of the effectiveness of the securing manual, paying attention to the maintenance and renewal records for the portable securing arrangements specified in the manual and if necessary, checking such arrangements randomly.

(2) Container corner fittings welded to hull structure or hatch covers are to be examined for cracks and deformation.

(3) Cell guides and associated components are to be examined for cracks, deformation or corrosion.

6.3.2.4 Intermediate surveys

The requirements for intermediate surveys are the same as those for annual surveys.

6.3.2.5 Special surveys

(1) In addition to the above requirements for the annual survey, the special survey is to include the following:

① The container securing arrangements are to be surveyed as follows:

a. the cell guide structure is to be thoroughly examined and particular attention is to be given to the connections between vertical cell guides and the cross ties. The cell guides and their entry devices are to be verified for efficient condition;

b. portable frameworks or other forms of structural restraint are to be thoroughly examined;

c. Fittings attached to the hull structure are to be carefully examined and no leakage is allowed around fittings in way of tanks.

② Where any renewal is required, the new item is to be of approved type and manufacture. Where test certificates are not available, the item is to be tested in accordance with Appendix 1, Chapter 7 of PART TWO of the Rules.

6.3.3 CLC notation

6.3.3.1 General requirements

(1) This paragraph applies to ships which have been assigned one of the following class notations related to container securing:

① CLC: lashing calculation programme;

② CLC(V): securing of containers for specified voyage;

③ CLC(V,W): securing of containers for specified weather.

6.3.3.2 Initial classification

(1) In respect to the initial classification for assigning the notations CLC, CLC(V) and CLC (V,W), the programme approval, the plan approval and the actual installation survey are to be carried out in accordance with the relevant requirements of Appendix 1 of Chapter 7, PART TWO of the Rules.

6.3.3.3 Annual surveys

(1) The owner is to declare to the attending Surveyor that no major change unapproved by CCS has been made.
(2) The annual survey is to include:
① examination of ambient conditions and location of system installation;
② system function test of a selected approved condition;
③ inquiry into any change of main parameters of the ship, and the effect of any change on calculation results;
④ inquiry whether an operating manual together with a test report approved by CCS are kept on board.

6.3.3.4 Special surveys

(1) In addition to the above requirements for the annual survey, the special survey is to include the following:
① programme privacy test;
② programme stability test.
(2) The special survey is to be carried out in the presence of the CCS Surveyor.

6.3.4 Loading Computer notation

6.3.4.1 General requirements

(1) This paragraph applies to ships which have been assigned one of the following class notations related to loading computers:
Loading Computer, and special notations: S, I, G, D
where:
S: the loading computer may be used in calculation and check of hull strength in all loading conditions;
I: the loading computer may be used in calculation and check of intact stability;
G: the loading computer may be used in calculation and check of stability of grain carried in bulk;
D: the loading computer may be used in calculation and check of damage stability.

6.3.4.2 Initial classification

(1) In respect to the initial classification for assigning the notation Loading Computer, the software approval, the plan approval and survey related to hardware and the actual installation survey are to be carried out in accordance with the relevant requirements of Appendix 1 of Chapter 2, PART TWO of the Rules.

6.3.4.3 Annual surveys

(1) The owner is to declare to the attending Surveyor that no major change unapproved by CCS has been made.
(2) The annual survey is to include:
① examination of ambient conditions and location of system installation;
② system function test of a selected approved condition;
③ inquiry into any change of main parameters of the ship, and the effect of any change of hull structure, lightweight and its distribution on calculation results;
④ inquiry whether an operating manual together with a loading calculation and test report approved by CCS are kept on board.

6.3.4.4 Special surveys

(1) In addition to the above requirements for the annual survey, the special survey is to include the following:
① software privacy test;
② system stability test;
③ self-checking function test of hardware and peripheral equipment.
(2) The special survey is to be carried out in the presence of the CCS Surveyor.

6.3.5 HMS & HMS (×) notations

6.3.5.1 General requirements

(1) This paragraph applies to ships which have been assigned one of the following class notations for hull monitoring systems:
HMS and HMS (×)

6.3.5.2 Initial classification

(1) For a ship intended for the notation HMS or HMS (×), the plans and documents required by 21.1.3 of Chapter 21, PART EIGHT of the Rules are to be submitted for approval.

(2) Initial classification surveys are to include the survey and testing of following items:

① examination of the Type Approval Certificate of the hull monitoring system;

② confirmation that the arrangement of each sensor is in conformity with the approved plans;

③ confirmation that the instruction manual and the log for maintenance and calibration have been kept on board;

④ in the sea trials:

a. confirmation that the initial readings of the sensors comply with the still water loading condition specified in 21.2.2.14, Chapter 21, PART EIGHT of the Rules;

b. carrying out performance tests of system functions;

⑤ confirmation that the software version of the hull monitoring system is the same as that on the approval certificate.

6.3.5.3 Annual surveys

(1) Examination of the log for maintenance and calibration of the hull monitoring system.

(2) Verification of the proper operation of the hull monitoring system.

(3) External examination of each sensor and its protective measures so far as practicable.

6.3.5.4 Intermediate surveys

(1) The scope of the intermediate survey is the same as that of the annual survey.

6.3.5.5 Special surveys

(1) In addition to the requirements of annual surveys mentioned above, the watertightness of sensors installed externally is to be inspected.

6.3.6 BDE-1/BDE-2/BDE-3 notation

6.3.6.1 General requirements

(1) This paragraph applies to ships having the class notation BDE-1/BDE-2/BDE-3.

6.3.6.2 Initial classification

(1) For a ship intended for the notation BDE-1/BDE-2/BDE-3, the plans and documents required by 4.1.4 of Chapter 4, PART EIGHT of the Rules are to be submitted for approval.

(2) During survey of the ship under construction, compliance of the arrangement and visibility of navigation bridge and wheelhouse, required systems and equipment with the rules and approved plans is to be confirmed.

6.3.6.3 Annual surveys

(1) Confirming that the field of vision in the wheelhouse complies with the design requirements and has not been altered.

(2) Examining systems and equipment for normal operation.

6.3.6.4 Intermediate surveys

(1) The scope of the intermediate survey is the same as that of the annual survey.

6.3.6.5 Special surveys

(1) The scope of the special survey is the same as that of the annual survey.

Section 4 SURVEYS RELATED TO CLASS NOTATIONS FOR AUTOMATIC CONTROL

6.4.1 General requirements

6.4.1.1 The requirements of this Section apply to ships assigned the following class notations:

(1) AUT−0 — indicating that the ship's propulsion plant can be remotely controlled from the bridge control station with the machinery spaces (including engine room centralized control station or room) periodically unattended;

(2) MCC — indicating that the machinery and electrical installations are capable of being operated with continuous supervision by watch-keepers from a centralized control station or room in the engine room;

(3) BRC — indicating that the ship's propulsion plant can be remotely controlled from the bridge control station with the engine room attended by watch-keepers.

6.4.2 Initial classification

6.4.2.1 The following surveys are to be carried out with regard to the class notation AUT−0:

(1) functional tests of safety systems, overriding function and alarm indicators;
(2) functional tests of control systems of main engines, auxiliary engines, boilers, power stations and other equipment;
(3) functional tests of changeover between each control station;
(4) relay alarm function and communication function of the navigation bridge and the engineers' accommodation;
(5) functional tests of fixed fire-extinguishing, fire detection and alarm systems;
(6) functional examination of bilge level alarm;
(7) the setting of alarm points and the preset parameters of safety systems is recorded and maintained onboard for information.

6.4.2.2 The following surveys are to be carried out with regard to the class notation MCC:
(1) functional tests of safety systems, overriding function and alarm indicators;
(2) functional tests of control systems of main engines, auxiliary engines and boilers;
(3) functional tests of fixed fire-extinguishing, fire detection and alarm systems;
(4) functional examination of bilge level alarm;
(5) the setting of alarm points and the preset parameters of safety systems is recorded and maintained onboard for information.

6.4.2.3 The following surveys are to be carried out with regard to the class notation BRC:
(1) functional tests of safety systems, overriding function and alarm indicators;
(2) functional tests of control systems of main engines;
(3) the setting of alarm points and the preset parameters of safety systems is recorded and maintained onboard for information.

6.4.2.4 Where computer based systems are used in the automation system, onboard tests are to be carried out in conjunction with surveys of automation systems in accordance with the requirements of Section 6, Chapter 2, PART SEVEN of the Rules.

6.4.3 Annual survey

6.4.3.1 Examining the engine logbook since the last survey, including the record of normal use of main engines, auxiliary engines, boilers, power stations and other essential equipment and the record of automatic speed reduction and stop as well as overriding, any identified abnormality or functional failure, and the record of corrective actions taken.

6.4.3.2 Carrying out functional tests required in 6.4.2 of this Section.

6.4.3.3 Where computer based systems are used in the automation system, functional tests of computer based systems are to be carried out in conjunction with surveys of automation systems. Examining the record of change of software and hardware.

6.4.4 Intermediate survey

6.4.4.1 Same as annual survey.

6.4.5 Special survey

6.4.5.1 Same as annual survey.

Section 5 SURVEYS RELATED TO CLASS NOTATIONS FOR GREEN ECO-SHIPS

(This Section is deleted)

Section 6 SURVEYS RELATED TO CLASS NOTATIONS FOR REFRIGERATED CARGO INSTALLATIONS

6.6.1 General requirements

6.6.1.1 This Section applies to ships which have been assigned one or more of the following class notations related to refrigerated cargo installations:

(1) Cargo refrigeration: CRS (×× hold – ××℃, ××℃ Max. sea Water);
Cargo fruit preservation: CF (added to refrigerating plant suitable for carrying fruit cargo);

6.6.2 Initial classification

6.6.2.1 Plans and documents

(1) Plans, information and technical documents of refrigerated cargo installations are to be submitted to CCS for approval in accordance with relevant requirements as specified in 1.1.5 of Chapter 1, PART FIVE of the Rules. Additional plans, information and technical documents may be required, if considered necessary.

(2) Any subsequent modifications or alterations to the approved plans, information or technical documents are to be resubmitted to CCS for approval.

(3) Where refrigerated cargo installations are fitted with remote or automatic controls, the information and specifications of such controls are to be submitted to CCS for approval.

6.6.2.2 Survey during construction

(1) The complete installations together with their installing and arrangement are to be examined and tested.

(2) The materials used for the construction are to be tested in accordance with the relevant requirements of the Rules for Materials and Welding. Materials for which no requirement is made in the Rules may be tested in accordance with the technical specifications recognized by CCS.

(3) The principal materials and essential components such as compressors, condensers and oil separators, etc., intended for the refrigerated cargo installations are subject to products approval surveys by CCS.

(4) On completion of the construction, and after having been subjected to a refrigeration test and a thermal resistance test of the cargo chambers, the refrigerated cargo installation is to be subjected to a thermal balance test to determine the capability of the installation to perform its maximum duty. For ships of the same type with similar refrigerated cargo installations, subsequent thermal balance test may be waived, provided that the results of the refrigeration test and the thermal resistance test of refrigerated holds/chambers are satisfactory.

(5) Where the proposed construction of the refrigerated cargo installations is novel in design or involves the use of unusual material, additional tests may be required by CCS.

6.6.3 Annual surveys

6.6.3.1 General requirements

(1) For the annual survey of classed refrigerated cargo installations, opening up for examination of the machinery or dismantling of the insulation arrangements is not normally required. If any defects or indications of deficiency in the installation affecting the class or the temperature notation assigned are found, the Surveyor may require opening up the suspected items for examination to assure the installation to be in an efficient working condition.

(2) An examination of the logbook or other records of the refrigerated cargo installation is to be made, and any breakdown or malfunction of the installation during the last 12 months is to be noted in the survey report.

(3) Examination of the machinery is to be made under working conditions.

6.6.3.2 Examination of refrigerated holds/chambers

(1) A surface inspection of the insulated holds/chambers is to be carried out for the condition of insulation linings and fastenings on the sides, bulkheads and deckheads.

(2) The coverings on deck, tank top and tunnel top insulation are to be examined.

(3) Any indication of dampness or deterioration of the insulation is to be investigated.

(4) The condition of air ducting, cooler casings, hatch covers and plugs, access plugs, access doors and fastenings, bilge and manhole plugs, and air refreshing pipes with their closing appliances, is to be examined.

(5) Scuppers for chambers and cooler trays are to be examined.

(6) Examination of refrigeration equipment and thermometers

① Air cooler coils, cooling grids, brine cooler coils and grids, the shells of shell-and-tube type and double-pipe type condensers and evaporators, oil separators, receivers, driers, filters and other pressure vessels, piping and arrangements are to be examined.
② Any evidence of corrosion of water end covers of shell-and-tube type and double-pipe type condensers is to be examined.
③ All pressure vessels, including fittings and safety devices, are to be externally examined.
④ If there is evidence of dampness of the insulation covering pressure vessels, their connections and/or piping, the cause is to be ascertained.
⑤ Thermometers and apparatus used for measuring the temperature in refrigerated holds/chambers, and of the air inlet and outlet ducting, are to be examined. A random test for thermometers is to be made to verify their accuracy.

(7) Electrical equipment
① A general examination is to be made for electrical motors driving refrigerant compressors, pumps and fans, together with their control gear and cables. A random test for insulation resistance relative to earth is to be made on the cables, switchgear, motors, etc. The installation may be divided for the purpose of this test, and the Surveyor may at his discretion accept the results of testing carried out by competent personnel.
② A random test is to be made to demonstrate that the automatic controls, safety devices and alarms are in good working order.

(8) Refrigeration tests: Refrigeration tests and thermal insulation tests for holds/chambers are to be made to the refrigerated cargo installations.

6.6.4 Special surveys

6.6.4.1 At the special survey, in addition to all items required for annual surveys, the following items are to be surveyed.

6.6.4.2 First special survey after construction:

(1) Examination of compressors and pumps
① Each reciprocating compressor is to be opened out. Cylinder bores, pistons, piston rods, connecting rods, crankshafts, valves and seats, glands, relief devices, suction filters and lubricating arrangements are to be examined. Crankcase glands and the lower halves of main bearings need not be exposed provided that the Surveyor is satisfied as to the alignment and wear.
② Screw-type compressors are to be opened out and examined.
③ Refrigerant condenser cooling water pumps, including standby pump(s) which may be used in other services, are to be opened out and examined.
④ Brine and refrigerant circulating pumps are to be opened out and examined. Special consideration will be given to survey requirements for refrigerant circulating pumps of the hermetically sealed type.

(2) Examination of pressure vessels and heat exchangers
① The water end covers of shell-and-tube type and double-pipe type condensers are to be removed for examination of the tubes, tube plates and covers.
② The shells and connections of shell-and-tube type and double-pipe type condensers and evaporators, separators, receivers, driers, filters and other pressure vessels, and the coil terminals of coil-in-casing type condensers and evaporators, are to be examined in so far as practicable.
③ In the case of pressure vessels covered by insulation, any evidence of dampness or deterioration of the insulation which could lead to external corrosion of the vessels or their connections is to be investigated.
④ When in doubt, sufficient insulation is to be stripped from insulated pressure vessels to permit the condition of the vessels to be ascertained. Care is to be taken that in replacement of the insulation, the vapour sealing of the outer covering is made good.

(3) Examination of piping and fittings
① Confirming that the insulation of pipes carrying the refrigerant both outside and inside the insulated chambers is in good order, and examining the pipes, including their connections, under working conditions for confirming that they are in normal order. Care is to be taken that in replacement of the insulation, the vapour sealing of the outer covering is made good.
② Confirming that all pressure relief valves and safety discs throughout the refrigerating plant are in good order. However, no attempt is to be made to test refrigerant pressure relief valves on board.
③ Sea connections to refrigerant condensers are to be opened out and examined at the hull or

machinery special survey.

(4) Examination of electrical equipment

① The electrical motors driving refrigerant compressors, pumps and fans, together with their control gear and cables, are to have their insulation resistance relative to earth tested. For the purpose of this test, the installation may be subdivided to any desired extent.

② All automatic controls and alarms are to be tested.

(5) Examination of refrigerated holds/chambers

① Examining insulation and air trunking of hold/chamber overhead and vertical surfaces and confirming that they are in normal condition. Care is to be taken that in repairing, the insulation or the ducts are sealed against air blowing into the insulation, or against moisture ingress.

② Confirming that the tank top insulation and protection are in normal condition. Care is to be taken that in repair or in replacement, the insulation or the protection is sealed against air blowing into the insulation, or against moisture ingress.

③ Due consideration is to be given to the type of insulation used in the holds/chambers when determining repair or replacement of the insulation. Where organic foam insulation has been used, including foamed in-situ type or other insulation slabs, the Surveyor may require an examination of the insulation by drilling holes.

④ Under normal circumstances, the condition of hold/chamber insulation, grounds, etc. may be inspected when examining the ship's steelwork at the special survey.

⑤ Arrangements made for defrosting air coolers and for draining condensate from trays below coolers are to be examined to confirm that they are in a good working condition.

⑥ Any air refreshing arrangements are to be examined.

6.6.4.3 Second and subsequent special surveys

(1) In addition to the items specified for the first special survey, the following additional items are to be examined:

① Gas condensers of the shell-and-tube type, and gas evaporators (brine coolers) of the shell-and-tube type in which refrigerant is in the shell, are to have the water or brine end covers removed and the shell pneumatically tested with the refrigerant or air, or a mixture of inert gas and refrigerant, to the pressures as required in Table 2.1.4.1 of Chapter 2, PART FIVE of the Rules, depending on the different refrigerants used.

② Gas evaporators (brine coolers) of the shell-and-tube type in which the refrigerant is in coil, are to have the refrigerant end covers removed and the shell hydraulically tested to 1.5 times the designed pressure, but not less than 0.34 MPa.

③ Heat exchangers used for cooling refrigerant liquid would normally require to be specially examined internally only if leakage is suspected between high and low pressure sides. This type of heat exchangers is to be examined and tested at the discretion of the Surveyor according to the design of such equipment.

6.6.4.4 At the request of the owner and upon approval by CCS, a system of continuous surveys may be undertaken whereby the special survey requirements are carried out in regular rotation.

Section 7 SURVEYS RELATED TO CLASS NOTATIONS FOR EOM

6.7.1 EOM system function and composition

EOM (Online Comprehensive Monitoring of Ship Energy Efficiency) system is a computerized system for ship's energy efficiency real-time on-line monitoring, which is capable of automatic acquisition of energy consumption and operating condition of ship's energy-consuming equipment such as main engine, generator engine, boiler, etc., as well as operating parameters of navigational equipment such as shaft power meter (for electric propulsion ships, shaft power can be calculated through generator power), GPS, anemorumbometer, speed log, electronic clinometer (if such equipment has signal access to EOM software system) and echo-sounder (if such equipment has signal access to EOM software system), and capable of data synchronization with the shore-based system at regular time, for the purpose of realizing on-line monitoring of operating condition of ship's energy-consuming equipment and consumption of energy as well as realizing the function of ship equipment monitoring, energy management and energy efficiency management by means of analysis of collected data.

6.7.2 Examination of plans

6.7.2.1 The following plans and documents are to be submitted to the plan approval center for approval:
(1) electrical system of EOM system (including system power supply, system input and output signal circuit and list of parameters);
(2) electrical system and arrangement of shaft power meter;
(3) fuel oil supply piping of main engine, generator engine and boiler;
(4) calculation method for shaft power for electric propulsion ships.
6.7.2.2 After the above plans are approved by the plan approval center, any non-principled revision may be reviewed and approved by the site Surveyor.
6.7.2.3 Mooring test and sea trial program of EOM system are to be reviewed and approved by the site Surveyor.

6.7.3 Product certification requirements and on-site check

6.7.3.1 Certification requirements for related hardware equipment are given in Appendix 1A, Chapter 3 of this PART.
6.7.3.2 For flowmeters and shaft power meters which are installed on ships applying for EOM notation and delivered before 31 December 2015, the existing type test report or other equivalent documents may be accepted by CCS.

6.7.4 Requirements for on-site survey

6.7.4.1 Equipment installation and system testing of EOM system are to be carried out in accordance with approved plans and equipment installation techniques approved by CCS (where applicable), and functional tests are to be carried out during mooring test and sea trial. Upon inspection and confirmation of peripheral hardware of EOM system and signal access to such system, the site Surveyor is to confirm relevant functions of modules related to ship equipment monitoring, energy management and energy efficiency management in EOM software system in accordance with approved test program.
6.7.4.2 Installation and survey of relevant signal acquisition equipment
For the following equipment within the statutory and class scope, in addition to complying with statutory and class inspection requirements for such equipment, they are also to be inspected in accordance with the following requirements:
(1) Shaft power meter:
  a) Installation survey is to be carried out in accordance with approved plans and manufacturer's instructions.
  b) Taking into account the effect of ship deformation and local vibration on the performance of shaft power meter, the stator mounting base of shaft power meter is to be welded firmly, generally on ship's strength members and it is not permitted to be welded on the shell plating.
  c) Witnessing calibration process and result of shaft power meter.
(2) Flowmeter:
  a) Checking the verification report of flowmeter.
  b) Installation survey is to be carried out in accordance with approved plans and manufacturer's instructions. Flowmeter is also to be installed by satisfying the requirements of Appendix 1.
(3) Electronic clinometer (if such equipment has signal access to EOM software system):
  a) Installation survey is to be carried out in accordance with approved plans and manufacturer's instructions.
  b) The electronic clinometer is to be calibrated during the performance test, confirming the output results of 0° and other angles of inclination.
(4) Anemorumbometer:
  a) Installation survey is to be carried out in accordance with approved plans and manufacturer's instructions.
  b) Survey of the performance test.
(5) Echo-sounder (if such equipment has signal access to EOM software system):
  a) Installation survey is to be carried out in accordance with approved plans and manufacturer's instructions.
  b) Survey of the performance test.
(6) Global Position System (GPS):
  a) Installation survey is to be carried out in accordance with approved plans and manufacturer's instructions.
  b) Survey of the performance test.
(7) Speed log:

a) Installation survey is to be carried out in accordance with approved plans and manufacturer's instructions.
b) Survey of the performance test.

(8) Engine room monitoring and alarm system:
a) Installation survey is to be carried out in accordance with approved plans.
b) Survey of the performance test.
c) Checking that the range of signal output to EOM system satisfies the minimum requirements for ship condition monitoring parameters in Appendix 2.

(9) Tank liquid level measuring system:
a) Installation survey is to be carried out in accordance with approved plans and manufacturer's instructions.
b) Survey of the performance test.

(10) Ship's draft measuring system (if such equipment has signal access to EOM software system):
a) Installation survey is to be carried out in accordance with approved plans and manufacturer's instructions.
b) Survey of the performance test.

6.7.4.3 Checking signal input and output of signal acquisition equipment:

(1) Checking the integrity of range of parameter input into EOM system (see Appendix 2).

(2) Checking the consistency between the parameter data of receiving end of EOM software system and that of sending end of signal acquisition equipment.

6.7.4.4 Verification of function of EOM software

To verify the following functions of the modules such as equipment monitoring, energy management and energy efficiency management in EOM software system:

(1) Equipment monitoring: to verify the real-time acquisition of the following parameter data within acquisition cycle by software system:
a) power, pressure, temperature of energy-consuming equipment such as main engine, generator engine and boiler (see the parameters required to be selected in Appendix 2);
b) flow of the fuel oil flowmeter of energy-consuming equipment such as main engine, generator engine and boiler;
c) shaft revolution, torque, power of shaft power meter of the main engine;
d) wind direction, wind forcer of anemorumbometer;
e) position, course, speed of the Global Position System (GPS);
f) water-tracing speed of the speed log;
g) angle of heel of electrical clinometer (if such equipment has signal access to EOM software system);
h) depth value of echo-sounder (if such equipment has signal access to EOM software system);
i) ship's draft of ship's draft measuring system (if such equipment has signal access to EOM software system).

(2) Energy management: to verify the indication of the following energy consumption indexes by the software system:
a) fuel consumption per hour;
b) daily fuel consumption.

(3) Energy efficiency management: to verify the calculation of the following main energy efficiency indexes by software system; energy efficiency indexes may be adjusted according to ship types and operation characteristics:
a) EEOI;
b) fuel consumption per mile;
c) fuel consumption per transport work;
d) CO_2 emissions per mile;
e) CO_2 emissions per transport work unit.

(4) The verification of software function above may be carried out by examining function of software system or outputting the report.

(5) Ship-shore communication: to verify the data transmission smoothly between ship side and shore side of EOM software system.

Appendix 1 REQUIREMENTS FOR INSTALLATION OF FLOWMETER

1 Requirements for installation position of flowmeters of fuel oil system of main/generator engines

1.1 The installation position of flowmeter is to satisfy the requirements for onboard arrangement.

1.2 Inlet flowmeter: where the signal of existing oil supply unit is available, the flow signal supplied by such unit may be used. Where the signal of existing oil supply unit is unavailable, an additional flowmeter may be fitted near the flowmeter of existing oil supply unit, generally positioned after fuel oil supply pump and before fuel oil circulation pump in order to avoid calculation of fuel oil circulation.

1.3 Outlet flowmeter: in the conventional arrangement of fuel oil system, after passing through a three-way valve, one way of return flow of main engine is returned to the air separator and such amount of oil is not included in repetitive calculation; another way is returned to the service tank. It is recommended to fit the flowmeter of return flow on the pipe returning to the service tank.

2 Requirements for installation position of a set of flowmeters of fuel oil system shared by main engines and generator engines

2.1 Reference may be made to plan 1 for installation position of flowmeter. In order to calculate the oil consumption of generator engine, separate flowmeters are to be fitted on the inlet and outlet main pipes of fuel oil system of generator engine. Although some fuel oil participates in the circulation, the calculated circulation data is not large due to low oil consumption of generator engine.

3 Requirements for installation position and number of flowmeters of fuel oil system of boiler

3.1 Reference may be made to installation plan of flowmeter of main engine. In case of no return flow or return flow is only returned to the air separator, the installation of return flow flowmeter is not necessary.

4 Requirements for installation of flowmeters

4.1 The flowmeter is to be provided with a by-pass device so that normal supply of fuel oil can be ensured in case of failure of the flowmeter.

4.2 With regard to the pressure requirement of the flowmeter, the operating pressure in way of instrument is at least to be greater than medium flash pressure + 3 times pressure loss of instrument itself, where the operating pressure means the operating pressure in way of instrument instead of the operating pressure supplied by the upstream source (see Figure 2).

$P_{\text{out}} = \text{outlet pressure}$
$P_{\text{dp}} = \text{pressure loss in way of instrument}$
$P_{\text{vp}} = \text{medium flash pressure}$

$$P_{\text{out}} \geq \left(3 \times P_{\text{dp}}\right) + P_{\text{vp}}$$

Figure 2 Pressure of Flowmeter

The flowmeter in general generates pressure loss of approximately 0.2 bar, not including pressure loss caused by other parts of the pipeline, e.g. bend, necking etc. Where the circulating medium has a low viscosity, the pressure loss can be calculated accurately. But where the HFO used has a high viscosity, the pressure loss within pipeline and instrument cannot be controlled satisfactorily, which will give rise to flow fluctuation or even no circulation during practical application. For the use of HFO medium, the operating pressure is to be supplied by pump in order to ensure that the pipeline is unblocked and the flow is steady.

4.3 The flowmeter is to be installed to avoid siphon and air pocket. During installation, the vertical down or inclined down direction is to be avoided, because a flowmeter installed in such a way may give rise to siphon. Additionally, where the outlet of a flowmeter installed horizontally is provided with a long pipeline in the vertical down direction, air pocket may occur (see Figure 3 for specific installation examples).

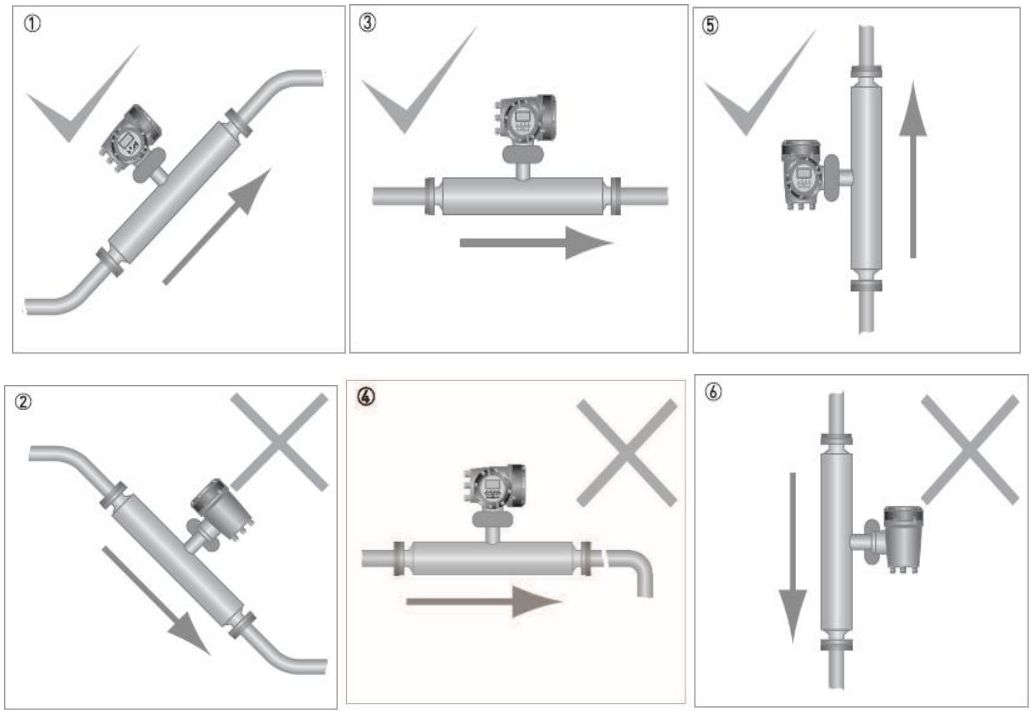

Figure 3 Installation of Flowmeters

4.4 In addition to the above requirements for installation of flowmeters, the requirements of the manufacturer may be accepted.

Appendix 2 SUMMARY OF PARAMETERS OF ENERGY EFFICIENCY EQUIPMENT

1 Alarm systems

The normal monitoring parameters of the operating conditions of ship's energy-consuming equipment such as main engine, generator engine and boiler may be selected from the summary of parameters below; the parameters with "*" are those required to be selected for EOM software system and others are optional monitoring parameters; a slight difference is permitted based on different design of ships. "#X" is the multi-equipment number and the corresponding parameters may be increased taking into account the number of equipment.

106	SHIP'S DRAFT (STERN)	m	
Fuel oil flowmeter			
107	M/E F O FLOW*	L	
108	M/E F.O.FLOW COUNTER	L/h	
109	M/E & D/G COMM FO FLOW*	L	
110	M/E F O RETURN FLOW*	L	If the main engines and generator engines share the inlet flow counter, the parameter may also indicate that the main engines and generator engines share the return oil
111	G/E F O FLOW*	L	
112	G/E F O RETURN FLOW*	L	
113	COMP BLR H F O FLOW*	L	
114	COMP BLR D F O FLOW	L	
115	COMP BLR FO RETURN FLOW*	L	

2 Anemorumbometer

No.	English name of switch-in parameters	Unit	Remark
1	WIND SPEED*	kts	
2	WIND DIRECTION*	°	
3	WIND SPEED UNIT		If any
4	T/R FLAG		
Remark			

3 Electronic clinometer

No.	English name of switch-in parameters	Unit	Remark
1	X*	°	
2	Y*	°	
Remark	The calibration for the installation of electronic clinometer is to be carried out to ensure that the electronic clinometer output the inclining conditions of the ship accurately		

4 Shaft power meter

No.	English name of switch-in parameters	Unit	Remark
1	SHAFT REVOLUTION*	rpm	
2	SHAFT TORQUE*	kNm	
3	SHAFT POWER*	kW	
4	SHAFT THRUST	kN	If any
Remark	The data may be accessible in the navigation bridge as an independent signal or together with the main signal of the engine room		

5 Global Position System

No.	English name of switch-in parameters	Unit	Remark
1	LATITUDE*		
2	N/S		
3	LONGITUDE*		
4	E/W		
5	SPEED OVER GROUND*		
6	COURSE OVER GROUND*		
7	UTC*		
Remark			

6 Speed log

No.	English name of switch-in parameters	Unit	Remark
1	LONGITUDINAL WATER-TRACING SPEED*	knots	
2	TRANSVERSE WATER-TRACING SPEED	knots	If any
3	LONGITUDINAL GROUND-TRACING SPEED	knots	If any
4	TRANSVERSE GROUND-TRACING SPEED	knots	If any
5	STERN TRANSVERSE WATER-TRACING SPEED	knots	If any
6	STERN TRANSVERSE GROUND-TRACING SPEED	knots	If any
7	TOTAL CUMULATIVE WATER DISTANCE	NM	
8	WATER DISTANCE SINCE RESET	NM	
9	TOTAL CUMULATIVE GROUND DISTANCE	NM	
10	GROUND DISTANCE SINCE RESET	NM	
Remark	The number of parameters is determined according to the number of cylinders of the ship's main engine, #X is the number of cylinder		

7 Echo-sounder

No.	English name of switch-in parameters	Unit	Remark
1	WATER DEPTH RELATIVE TO TRANSDUCER*	m	
2	OFFSET FROM TRANSDUCER	m	
3	MAXIMUM RANGE SCALE IN USE	m	
Remark			

Appendix 3 CHECKLIST OF SYSTEM FUNCTIONS OF EOM SOFTWARE

To verify the following functions of the modules such as data acquisition and monitoring, energy management and energy efficiency management in EOM software system:

1 Data acquisition and monitoring: to verify the real-time acquisition of the following parameter data within acquisition cycle by software system:

No.	Items to be surveyed	Result
1	Power, pressure, temperature of energy-consuming equipment such as main engine, generator engine and boiler	
2	Flow of the fuel oil flowmeter of energy-consuming equipment such as main engine, generator engine and boiler	
3	Shaft revolution, torque, power of shaft power meter of the main engine	
4	Wind direction, wind force of anemorumbometer	
5	Position, course, speed of Global Position System (GPS)	
6	Water-tracing speed of speed log	
7	Angle of heel of electronic clinometer (if such equipment has signal access to EOM software system)	
8	Depth value of echo-sounder (if such equipment has signal access to EOM software system)	
9	Ship's draft of ship's draft measuring system (if such equipment has signal access to EOM software system)	

2 Energy management: to verify the indication of the following energy consumption indexes by the software system:

No.	Items to be surveyed	Result
1	Fuel consumption per hour	
2	Daily fuel consumption	

3 Energy efficiency management: to verify the calculation of the following main energy efficiency indexes by software system:

No.	Items to be surveyed	Result
1	EEOI	
2	Fuel consumption per mile	
3	Fuel consumption per transport work	
4	CO_2 emissions per mile	
5	CO_2 emissions per transport work unit	

Place of survey: Attending surveyor:
Date of survey:

CHAPTER 1 GENERAL

Section 1 GENERAL PROVISIONS

1.1.1 Application

1.1.1.1 This PART applies to sea-going steel ships of all welded construction.

1.1.1.2 In addition, the hull is to comply with the applicable requirements in PART ONE of the Rules.

1.1.1.3 CSR oil tankers and bulk carriers are to satisfy the requirements of PART NINE of the Rules.

1.1.2 Definitions

1.1.2.1 Length of ship L (in m), i.e. the Rule length, is the distance measured on the waterline at the scantling draught from the forward side of the stem to the aft side of the rudder post, or to the centre of the rudder stock if there is no rudder post. L is not to be less than 96%, and need not be greater than 97%, of the extreme length on the waterline at the scantling draught. In ships with unusual stern and bow arrangement, the length L is to be specially considered.

For pontoon hulls, L is the distance on the waterline at the scantling draught from the forward side of the fore end plate to the aft side of the aft end plate.

For ships without rudder stocks (such as ships provided with azimuth thrusters), L is 97% of the extreme length on the waterline at the scantling draught.

1.1.2.2 Breadth of ship B (in m), is the greatest moulded breadth measured amidships at the scantling draught.

1.1.2.3 Moulded depth D (in m), is the vertical distance measured at the middle of the length L from top of keel to top of the deck beam at side on the uppermost continuous deck. When a rounded gunwale is arranged, the moulded depth is to be measured to the point of intersection of the continued moulded lines of the deck and side shell plating.

1.1.2.4 Draught d (in m) , i.e. the scantling draught, is the vertical distance measured at the middle of the length L from top of keel to the waterline at the scantling draught. Scantling draught, at which the strength requirements for the scantlings of the ship are met and represents the full load condition. The scantling draught is to be not less than that corresponding to the assigned freeboard.

1.1.2.5 Block coefficient C_b is the moulded block coefficient corresponding to the waterline at the scanting draught, to be determined by the following formula:

$$C_b = \frac{\nabla}{LBd}$$

where: ∇ — moulded displacement, in m³, at scantling draught d;

L, B, d — see 1.1.2.1, 1.1.2.2 and 1.1.2.4 of this Section.

1.1.2.6 Uppermost continuous deck is the uppermost deck which extends from the stem to the stern.

1.1.2.7 Strength deck means:

(1) the uppermost continuous deck;

(2) the superstructure deck extending within 0.5 L amidships, and having a length not less than 0.15 L, and the uppermost continuous deck extending outside the region of such a superstructure.

1.1.2.8 Lower decks: The continuous deck next below the uppermost continuous deck is to be named as 2nd deck, and so on. They are generally called lower decks.

1.1.2.9 Bulkhead deck is the highest deck to which the transverse watertight bulkheads extend.

1.1.2.10 Freeboard deck is the deck from which the freeboard is measured in accordance with the International Convention on Load Lines, 1966.

1.1.2.11 Platform decks are the non-continuous decks below the strength deck, which are not considered to be effective decks for longitudinal strength.

1.1.2.12 Superstructure and deckhouse: Superstructure is an enclosed structure on the uppermost continuous deck, extending from side to side of the ship or with the side plating not being inboard of the shell plating more than 4% of the breadth B. Forecastle, bridge and poop are regarded as superstructures. All other enclosed structures are to be termed as deckhouses.

1.1.2.13 Long superstructure and short superstructure: A superstructure having a length greater than 0.15 L and not less than 6 times its height is to be termed as a long superstructure, otherwise it is to be regarded as a short superstructure.

1.1.2.14 Long deckhouse and short deckhouse: A deckhouse having a length greater than 0.15 L and not less than 6 times its height is to be termed as a long deckhouse, otherwise it is to be regarded as a short deckhouse.

1.1.2.15 Stowage rate γ (m^3/t) is the volume of the hold, in m^3, excluding the volume contained within the depth of the cargo hatchway, divided by the mass of cargo, in tons, stowed therein.

1.1.2.16 Forward and after perpendiculars: The forward perpendicular is to coincide with the foreside of the stem on the scantling draught waterline on which the length L is measured. The after perpendicular is the perpendicular to the scantling draught waterline at a distance L aft of the fore end.

1.1.2.17 Large openings: A deck opening is to be regarded as a large opening if any of the following conditions applies:

(1) $\frac{b}{B_1} \geq 0.7$;

(2) $\frac{l_H}{l_{BH}} \geq 0.89$;

(3) $\frac{b}{B_1} > 0.6$ and $\frac{l_H}{l_{BH}} > 0.7$.

where: b — breadth of the opening, in m. Where there are several hatches abreast, b is the sum of individual widths of these openings, i.e. $b = b_1 + b_2$, as shown in Figure 1.1.2.17;

B_1 — maximum breadth of deck, in m, including opening, measured at the mid-length of the opening;

l_H — length of the hatch, in m;

l_{BH} — distance between centrelines of the deck strips at each end of the opening, in m, as shown in Figure 1.1.2.17. Where there are no further hatches fore or aft of the one under consideration, then l_{BH} is to be measured to the bulkhead.

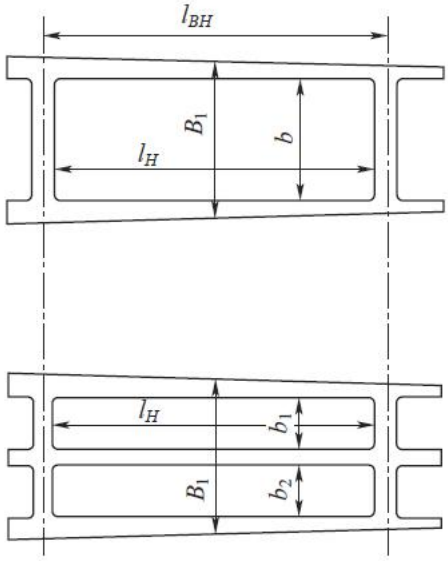

Figure 1.1.2.17

1.1.2.18 Primary members: The primary supporting members of hull are regarded as primary members, such as web frames, side stringers, transverses, deck girders, plate floors, bottom girders, bulkhead webs, etc.

1.1.2.19 Secondary members: The stiffeners of the plate are generally regarded as secondary members, i. e. frames, longitudinals, beams, bulkhead stiffeners and members of bracket floors, etc.

1.1.2.20 Load line length L_L (in m) is the ship's length as defined in Regulation 3 of Annex I to the International Convention on Load Lines, 1966.

1.1.2.21 Position 1 is as defined in Regulation 13 of Annex I to the International Convention on Load Lines, 1966.

1.1.2.22 Position 2 is as defined in Regulation 13 of Annex I to the International Convention on Load Lines, 1966.

1.1.2.23 Main frames are side frames between the collision bulkhead and the aft peak bulkhead, and below the lowest deck.

1.1.2.24 Frames in a 'tween deck space are frames between two decks.

1.1.2.25 Fore peak is a compartment situated forward of the collision bulkhead and below the bulkhead deck.

1.1.2.26 Aft peak is a compartment situated aft of the aft watertight bulkhead at the aft end of the ship

and below the bulkhead deck or the watertight platform deck.
1.1.2.27 V, the maximum service speed, in knots, means the greatest speed which the ship is designed to maintain in service at her deepest seagoing draught at the maximum propeller RPM and corresponding engine MCR (Maximum Continuous Rating).

Section 2 HULL STRUCTURAL MEMBERS

1.2.1 General requirements

1.2.1.1 Except where otherwise stated, the Rule section modulus or moment of inertia in this PART is the minimum required value of the section in association with attached plating, and the attached plating is assumed as being normal to the web. When the attached plating is not normal to the web and the angle between them is less than 75°, the sectional characteristics (moment of inertia, section modulus and shear area) are to be calculated in respect to the axis parallel to the attached plating. When a structural member is of rolled section(s), its actual section modulus may be approximately determined by the following formula:

$$W = W' \sin\alpha \qquad \text{cm}^3$$

where:
W' — actual section modulus with the attached plating assumed as being normal to the web, in cm^3;
α — angel between web and attached plating, in degrees.

1.2.1.2 Except where otherwise stated in the Rules, holes are not to be cut at random in the structural members specified in this PART.
1.2.1.3 In formulae or tables where only midship and end scantlings are given, the reduction from the midship to the end scantlings is to be effected in as gradual a manner as practicable. At the break of structures, constructional arrangement is to be made to ensure a gradual transition.
1.2.1.4 Unless otherwise stated, any intermediate value between the values listed in the Tables may be obtained by linear interpolation.
1.2.1.5 As commercialized marine plates and rolled sections are not produced in sequential size series and for the purpose of providing an economic and reasonable structural requirement without compromising structural strength, the rounding tolerance for selecting steel plates according to the sizes of structural members as required in this PART is to be based on the following principles:
(1) Where the decimal part of the calculated plate thickness in this PART is 0.25 mm or less, it may be neglected; where it is greater than 0.25 mm but less than 0.75 mm, to be taken as 0.5 mm; where it is 0.75 mm or more, a round number of 1 mm is to be taken.
(2) For a structural member made of rolled section(s), its section modulus with the effective attached plate being taken into account, may be 3% less than the value required in this PART.
(3) When same sizes are taken during construction for a group of members of a same type made of rolled sections adjacent to each other in the same area, their respective section moduli with their effective attached plates being taken into account, are not to be less than the mean value of the values respectively required in this PART for individual members of the group. However, this mean value is not to be less than 95% of the greatest value required in this PART for an individual member of the group.
(4) The above principles (2) and (3) are not to be applied together.
1.2.1.6 Unless otherwise stated, all scantlings given in this PART are to be regarded as the minimum required. When designing structural members, those subject to excessive corrosion or wear and tear in service may be adequately increased in thickness.
1.2.1.7 Local members which may frequently bear the forces resulting from docking, pushing or towing, etc., are to be strengthened appropriately.

1.2.2 Attached plating of members

1.2.2.1 The effective sectional area A of attached plating of primary members is to be determined as follows, but is not to be less than the sectional area of the face plate:
(1) For a member attached to plane plating:

$$A = 10\, fbt_p \qquad \text{cm}^2$$

(2) For a member attached to corrugated plating and parallel to the corrugations:

$$A = 10\, at \qquad \text{cm}^2$$

(3) For a member attached to corrugated plating and at right angles to the corrugations:

$$A = 10\, b_f t_f \qquad \text{cm}^2$$

where: f — factor, equal to $0.3(l/b)^{2/3}$, but not to exceed 1;
b — the mean width, in m, of the load-bearing area of primary members;

l — the overall length, in m, of the primary member;
t_p — the mean thickness, in mm, of the attached plating;
b_f — the width, in m, of the face plate of primary members;
t_f — the thickness, in mm, of the face plate of primary members;
a — the width, in m, of corrugated plating flange;
t — the thickness, in mm, of corrugated plating.

1.2.2.2 For secondary members, the width of attached plating is taken as one spacing of the corresponding members.

1.2.3 The span point of members

1.2.3.1 Except where otherwise stated, the span used for the calculating of the members in this PART is the effective span between the span points.

1.2.3.2 For primary members, the span point is to be taken at a point b_e distant from the end of the member (See Figure 1.2.3.2):

$$b_e = b_b(1-\frac{d_w}{d_b})$$

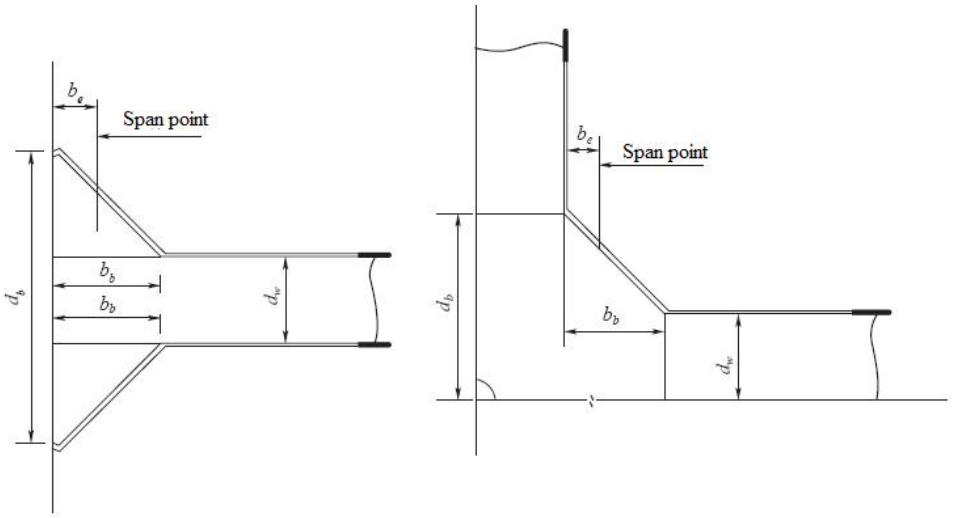

Figure 1.2.3.2

1.2.3.3 For span points of secondary members where end brackets are fitted, see Figure 1.2.3.3 (1). Where there is no end bracket, the span point is to be taken at the end of the member (as shown in Figure 1.2.3.3 (2)).

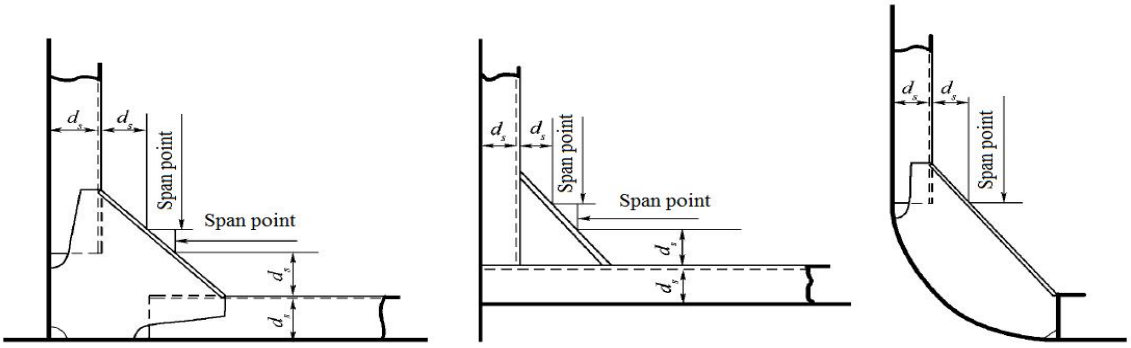

Figure 1.2.3.3(1)

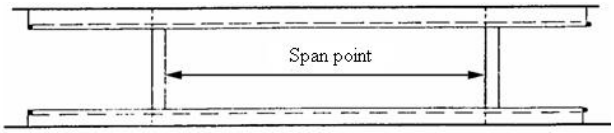

Figure 1.2.3.3(2)

1.2.3.4 Unless otherwise specified in this PART, the span of curved members is defined as the chord length between span points.

1.2.3.5 Where the ends of stiffening members are not substantially fixed against rotation and displacement, consideration will be given to the effective span to be used for the stiffener.

1.2.4 Geometrical characteristics of members

1.2.4.1 Section area A_z, moment of inertia I and section modulus W of rolled sections (including bulb flats, unequal angle bars, and unequal angle bars of unequal thickness) (see Figure 1.2.4.1) together with attached plating are to be calculated by the following formulae:

$$A_z = A_1 + A \qquad \text{cm}^4$$

$$I = I_{x1} + (y_1 - y)^2 A_1 + \frac{At^2}{12} \times 10^{-2} + (0.05\,t + y)^2 A \qquad \text{cm}^4$$

$$W = \frac{I}{0.1h - y} \qquad \text{cm}^3$$

where: h — height of the sections, in mm;

A_1 — sectional area of the sections, in cm^2;

I_{x1} — moment of self-inertia of the sections, in cm^4;

y_1 — neutral axis of the sections, in cm;

A — sectional area of the attached plate, in cm^2;

t — thickness of the attached plate in mm;

y — neutral axis with attached plate being considered, to be calculated by the following formula:

$$y = \frac{A_1 y_1 - 0.05At}{A_Z} \quad \text{cm}$$

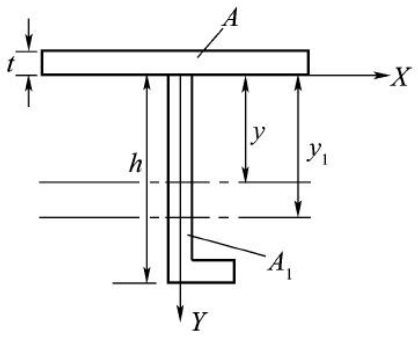

Figure 1.2.4.1

1.2.4.2 Where the thickness of both face plate and attached plate of T sections is not greater than 1/10 of web depth, section modulus W and moment of inertia I for T sections with attached plating (see Figure 1.2.4.2) may be calculated by the following formulae:

$$W = \frac{d_W}{10}\left[a + \frac{f_s}{6}\left(1 + \frac{2(A-a)}{2A + f_s}\right)\right] \quad \text{cm}^3$$

$$I = \frac{d_W^2}{100}\left[\frac{1}{3} f_s + \frac{Aa - 0.25 f_s^2}{A + a + f_s}\right] \qquad \text{cm}^4$$

where: a — sectional area of face plate, in cm^2;

A — sectional area of attached plating, in cm^2; where $A < a$, it is taken as $A = a$;

f_s — sectional area of web plate, in cm^2;

d_w — depth of web, in mm.

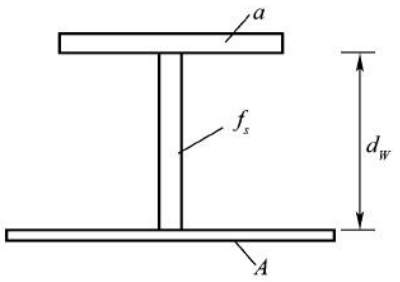

Figure 1.2.4.2

1.2.4.3 The section modulus W and moment of inertia I of a corrugation over a spacing s for corrugated bulkheads (see Figure 1.2.4.3) may be calculated by the following formulae:

$$W = d_w t\left(a + \frac{b}{3}\right) \quad \text{cm}^3$$

$$I = \frac{1}{20} d_w^2 t\left(a + \frac{b}{3}\right) \quad \text{cm}^4$$

where: a — width of corrugation flange, in m;
b — width of corrugation web, in m;
d_w — depth of corrugation, in mm;
t — thickness of corrugated bulkhead plating, in mm;
α — angle between web and flange of a corrugation.

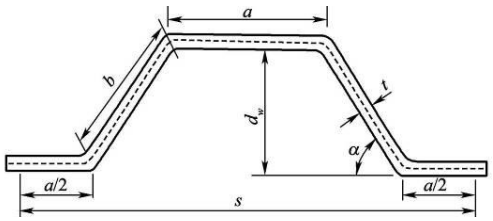

Figure 1.2.4.3

1.2.4.4 The section modulus W and moment of inertia I of double skin bulkheads (see Figure 1.2.4.4) may be calculated by the following formulae:

$$W = b\left(fst_p + \frac{bt_w}{6}\right) \times 10^3 \quad \text{cm}^3$$

$$I = 5\left(fst_p + \frac{bt_w}{6}\right) b^2 \times 10^4 \quad \text{cm}^4$$

where: b — spacing of double skins, in m;
s — average spacing of diaphragms, in m;
t_p — thickness of double skin bulkheads, in mm;
t_w — thickness of web, in mm;
f — factor, the same as specified in 1.2.2.1 of this Chapter.

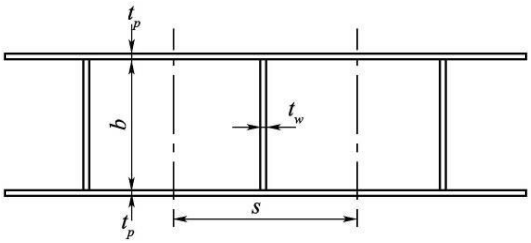

Figure 1.2.4.4

1.2.4.5 The minimum radius r of inertia of sectional area of members is to be calculated by the following formula:

$$r = \sqrt{\frac{I}{A}} \quad \text{cm}$$

where: I — minimum moment of inertia of sectional area of members, in cm^4;
A — sectional area of members, in cm^2.

1.2.5 Structural details

1.2.5.1 Primary members are to be so arranged as to ensure effective continuity of structure, and abrupt changes of depth or section are to be avoided. Where members abut on both sides of a bulkhead, or on other members, arrangements are to be made to ensure that they are in alignment. Primary members in tanks are to form a continuous line of support and wherever possible, a complete ring framing. The connections of the ring framing are to be made of rounded corners having an adequate radius, and the radius of rounded corners is in general not to be less than the web depth of the adjacent members.

1.2.5.2 The web thickness t_w of primary members is not to be less than 0.01 S_w, in mm (where S_w = spacing of horizontal stiffeners on primary member web, or depth of unstiffened web, in mm); but not less than 7 mm in dry spaces and not less than 8 mm in tanks. For ships of less than 60 m in length, the web thickness may be reduced by 1 mm. For ships of less than 40 m in length, the web thickness may be reduced by 2 mm.

1.2.5.3 The sectional area A_f of face plate of primary members is not to exceed $d_w t_w/150$, in cm^2 (where d_w = depth of primary member web, in mm, t_w = thickness of primary member web, in mm).

1.2.5.4 Primary members are to be supported by tripping brackets. Where the primary members are of symmetrical section, the tripping brackets are to be fitted four secondary member spaces apart and if the width of the face plate of primary members is more than 400 mm, a back bracket is to be provided in way of the tripping bracket. Where the primary members are of asymmetrical section, tripping brackets are to be fitted on one side of the web at alternate secondary members. Tripping brackets are also to be fitted to the primary members in way of concentrated loads. If the ratio of depth to thickness of the web is greater than 55, tripping brackets or stiffeners are to be fitted close to the toes of end brackets.

The height of tripping brackets is to be extended to the face plate of primary members. The breadth is not to be less than 40% of the height. Where the unsupported breadth of the face plate or flange of primary members exceeds 15 t (t being thickness of face plate of primary members), the tripping brackets are to be welded to the face plate or flange of primary members. The thickness t_b (in mm) of tripping brackets is not to be less than 5 + 0.025 L, but need not be greater than that of web of primary members, where L being length of ship (which need not be greater than 300 m in calculation). Where the free edge length l_b (in m) is greater than 0.06 t_b, the tripping brackets are to have face plate or flange, and the sectional area A (in cm^2) of which is generally not to be less than 10 l_b.

1.2.5.5 All openings on structural members are to be kept clear of areas of stress concentration and where this is impracticable, corresponding compensation is to be made. All corners of openings are to be well rounded. Where structural members are directly connected with plates, hard points are to be avoided.

1.2.5.6 Within 0.4 L amidships, where the web height of strength deck girders is greater than 65 $t\sqrt{K}$ (t being web thickness, while K being material factor), horizontal stiffeners are to be provided parallel to face plate.

1.2.6 Secondary member end connections

1.2.6.1 Unless otherwise specified in this PART, the end connections of secondary members are to comply with the requirements of 1.2.6.

1.2.6.2 The ends of secondary members are generally to be bracketed, see Figure 1.2.6.2. Where secondary members pass through primary members, secondary members are to be connected to the webs of primary members by welding.

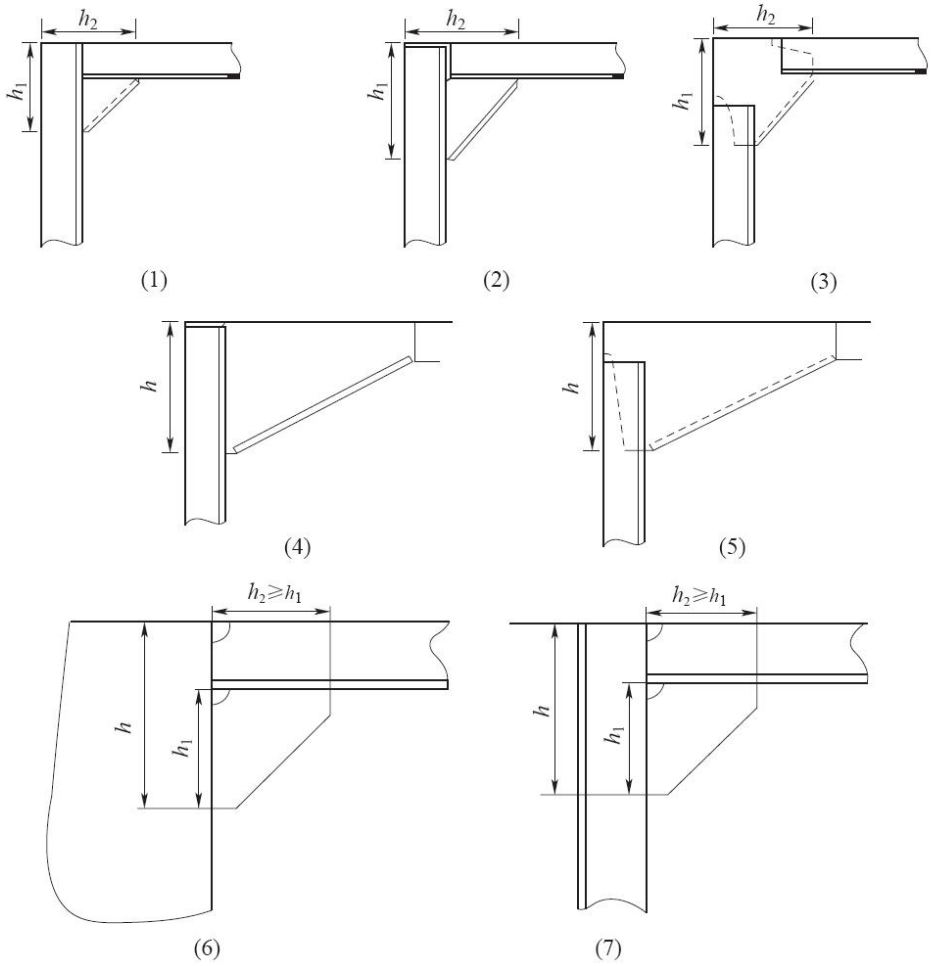

Figure 1.2.6.2

1.2.6.3 Where the secondary members contributing to longitudinal bending strength are cut in way of bulkheads or transverse primary members, connecting brackets are to be provided so as to ensure the longitudinal continuity. The brackets at both sides of the bulkheads or transverse primary members are to be in alignment.

1.2.6.4 The section modulus W of frames that is used for determining the scantlings of brackets is to be selected as follows:

(1) For the brackets connecting the secondary to the primary members, W is the section modulus of the secondary members.

(2) For the brackets at frame ends, W is the section modulus of the frames.

(3) For other brackets, W is the lesser of section moduli of two connecting members.

1.2.6.5 The thickness t of brackets is to be not less than that obtained from the following formulae:

$$t = (0.25\sqrt{W} + 2)\sqrt{\frac{R_{eH_s}}{R_{eH_b}}} + C \quad \text{mm, for brackets with face plate or flanged brackets}$$

$$t = (0.25\sqrt{W} + 3.5)\sqrt{\frac{R_{eH_s}}{R_{eH_b}}} + C \quad \text{mm, for brackets without face plate or unflanged brackets}$$

where: W — Rule section modulus of frames, in cm^3;

R_{eH_s} — yield stress of material of frames, in N/mm^2;

R_{eH_b} — yield stress of material of brackets, in N/mm^2;

C — coefficient, taken as 2.5 for brackets in tanks or 1.5 for other brackets.

The minimum thickness of brackets is generally to be 6.5 mm and need not be greater than 15 mm.

1.2.6.6 Where the Rule section modulus W of frames is not less than 500 cm^3 or the free edge is more than 50 times the thickness of brackets in length, the brackets are to be flanged or fitted with face plates. The breadth b of the flanges or face plates is not to be less than that obtained from the following formula:

$$b = 0.04W + 40 \text{ mm, and not less than 50 mm}$$

where: W — Rule section modulus of frames, in cm^3.

1.2.6.7 The arm length h of brackets is not to be less than 2.2 times the web depth of frames (where the ends of frames are welded, it may be reduced to not less than twice the web depth, see Figure 1.2.6.2 (1)), and is not to be less than that obtained from the following formula:

$$h = 75\sqrt{\frac{W}{t - C}} \text{ mm}$$

where: W — Rule section modulus of frames, in cm^3;
t — thickness of brackets, in mm;
C — coefficient, see 1.2.6.5 of this Section.

1.2.6.8 The two arms of the brackets are to be as far as possible equal in length. Where the two arms are not the same in length, they are to comply with the following:

$$h_1 + h_2 \geq 2h$$
$$h_1 \geq 0.8h$$
$$h_2 \geq 0.8h$$

where: h_1, h_2 — actual length of bracket arms, in mm, as shown in Figure 1.2.6.2;
h — arm length of brackets, in mm, see 1.2.6.7 of this Section.

1.2.6.9 Where the frame is lapped to the bracket, the length of overlap is not to be less than 1.25 times the web depth of the frame.

1.2.6.10 Where the frames are bracketed to primary members, such brackets are in general to be extended to the face plates of primary members.

1.2.7 Primary member end connections

1.2.7.1 Unless otherwise specified in this PART, the end connections of primary members are to be in compliance with the requirements of 1.2.7.

1.2.7.2 The ends of primary members are to be fitted with connecting brackets. Where two primary members are connected with a bracket, the scantlings of the bracket may be determined based upon the primary member having the lesser section modulus.

1.2.7.3 The arm length of the end bracket, which includes the web depth of the primary member, is not to be less than twice the web depth of the primary member, and the thickness of the bracket is not to be less than that of the web plate of the primary member. The brackets are to be flanged or fitted with face plates, the scantlings of which are generally to be the same as the face plates of primary members. The web plates of primary members are to be welded to connecting members. Where the side length of the non-stiffened triangle of the bracket is greater than $100t$ (t being the web thickness of the bracket), stiffeners parallel to the face plate of the bracket are to be fitted in accordance with 5.12.2.6 of Chapter 5 of this PART.

1.2.7.4 Where primary members, which are not in tanks, are connected by integral end brackets to bulkheads (i.e. the web plates of primary members gradually raised at ends), the arm length of brackets is not to be less than 1.5 times the web depth of primary members. The web plates of primary members are to be welded to bulkheads and the face plates are to be extended continuously to the bulkheads.

1.2.7.5 Where the deck girders or transverses are to be connected to bulkheads or vertical members of shell plating, the increase of scantlings of the vertical members may be required in order to ensure that connecting joints have adequate resistance to rotation.

1.2.7.6 In order to avoid the stress concentration at ends of primary strength members, the thickness of their web plates are to be adequately increased in way of toe ends of large brackets, and the face plates of brackets are to be beveled to ends. The height of toes is in general not to be greater than the thickness t_w of bracket toes, and is not to be less than 15 mm. For the recommended structural configuration of toe ends of large brackets, see Figure 1.2.7.6.

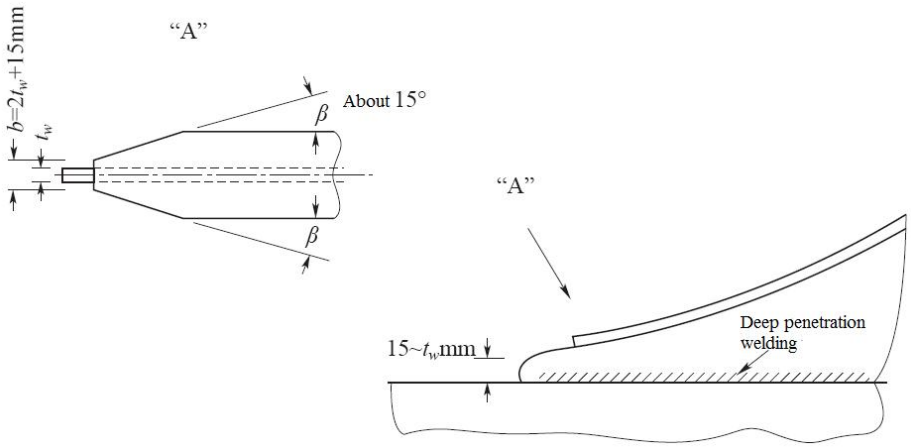

Figure 1.2.7.6

1.2.8 Standard spacing of framing members

1.2.8.1 The standard spacing s_b of frames, beams or longitudinals (bottom, side and deck) is to be calculated by the following formula:

$$s_b = 0.0016L + 0.5 \quad \text{m, but not greater than 0.7 m}$$

where: L — length of ship, in m.

1.2.8.2 In fore and aft peak tanks, the standard spacing s_b of frames or side longitudinals is to be that obtained from 1.2.8.1 or 0.6 m, whichever is the lesser.

1.2.8.3 Within $0.05L$ at ends, the standard spacing s_b of deck longitudinals or deck transverses of superstructures and deckhouses is to be that obtained from 1.2.8.1 or 0.6 m, whichever is the lesser.

Section 3 MATERIALS

1.3.1 General requirements

1.3.1.1 The chemical composition and mechanical properties of hull structural steels are to comply with the relevant requirements of Chapter 3 of PART ONE of CCS Rules for Materials and Welding.

1.3.1.2 Manufacture and testing of hull structural steels are to comply with the requirements of Chapter 1 and Chapter 2 of PART ONE of CCS Rules for Materials and Welding.

1.3.1.3 Steel castings or steel forgings used for the construction of stems, rudder posts, shaft brackets, rudder stocks and other hull structures are to comply with the relevant requirements of Chapter 5 and Chapter 6 of PART ONE of CCS Rules for Materials and Welding.

1.3.1.4 Except where otherwise stated, the elastic modulus of steel is to be taken as 2.06×10^5 N/mm^2.

1.3.1.5 Steels having a yield point not less than 265 N/mm^2 are regarded as higher tensile steels.

1.3.1.6 Where higher tensile steel is used for hull structures, its category, grade, location and extent are to be marked on the structural drawings so as to facilitate for maintenance.

1.3.1.7 The material factor K of hull structural steel is given in Table 1.3.1.7.

1.3.1.8 Unless specially provided, the yield strength of material (yield stress or yield point of material) is the specified minimum yield stress in the Rules for Materials and Welding, and the non-proportional extension strength is the minimum value of specified non-proportional extension stress.

Material Factor K **Table 1.3.1.7**

Yield strength R_{eH} (N/mm^2)	Material factor K	Yield strength R_{eH} (N/mm^2)	Material factor K
235	1.0	355	0.72
265	0.92	390	0.68 (0.66①)
315	0.78	460	0.62②

Notes:

① only apply to the strength deck and hatch coaming of containerships complying with the requirements of 7.1.1.4 of Section 1, Chapter 7 of this PART;

② only apply to the strength deck, hatch coaming plate and top plating with the range of thickness 50 mm < t ≤ 100 mm onboard container ships.

③ for materials with yield strength not listed in the table, the material factor may be specially considered.

1.3.2 Requirements for hull structural steel at normal temperature

1.3.2.1 In ships of 90 m or over in length, the hull structural steel is to comply with the requirements of 1.3.2.2 below. For strength members not covered by Tables 1.3.2.2(1) to 1.3.2.2(6) or in ships of less than 90 m in length, grade A/AH steel can generally be used for hull structure. The steel grade is to correspond to the as-built plate thickness and material class.

1.3.2.2 Materials in the various strength members are not to be of lower grade than those corresponding to the material classes and grades specified in Table 1.3.2.2(1) to Table 1.3.2.2(7). General requirements are given in Table 1.3.2.2(1), while additional minimum requirements are given in the following Tables:

Table 1.3.2.2(2): for ships, excluding liquefied gas carriers covered in Table 1.3.2.2(3), with length exceeding 150 m and single strength deck;

Table 1.3.2.2(3): for membrane type liquefied gas carriers with length exceeding 150 m;

Table 1.3.2.2(4): for ships with length exceeding 250 m;

Table 1.3.2.2(5): for single side bulk carriers subjected to SOLAS regulation XII/6.4;

Table 1.3.2.2(6): for ships with ice strengthening.

1.3.2.3 For hull structural members of different material classes, the grades of steel are to be selected from Table 1.3.2.2(7) in accordance with the thickness of the structural members.

1.3.2.4 Where plate thickness is greater than that required in the Rules, the grade of steel is to be selected from Table 1.3.2.2(7) in accordance with the as-built thickness of plates.

Material Classes and Grades for Ships in General **Table 1.3.2.2(1)**

Category	Structural member	Material class/grade
Secondary	(1) Longitudinal bulkhead plating, other than that belonging to the Primary category (2) Deck plating exposed to weather, other than that belonging to the Primary or Special category (3) Side plating	Class I within 0.4*L* amidships Grade A/AH outside 0.4*L* amidships
Primary	(1) Bottom plating, including keel plate (2) Strength deck plating, excluding that belonging to the Special category (3) Continuous longitudinal plating of strength members above strength deck, excluding hatch coamings (4) Uppermost strake in longitudinal bulkhead (5) Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank	Class II within 0.4*L* amidships Grade A/AH outside 0.4*L* amidships
Special	(1) Sheer strake at strength deck① (2) Stringer plate in strength deck① (3) Deck strake at longitudinal bulkhead, excluding deck plating in way of inner-skin bulkhead of double-hull ships①	Class III within 0.4*L* amidships Class II outside 0.4*L* amidships Class I outside 0.6*L* amidships
	(4) Strength deck plating at outboard corners of cargo hatch openings in container carriers and other ships with similar hatch opening configurations	Class III within 0.4*L* amidships Class II outside 0.4*L* amidships Class I outside 0.6*L* amidships Min. Class III within cargo region
	(5) Strength deck plating at corners of cargo hatch openings in bulk carriers, ore carriers, combination carriers and other ships with similar hatch opening configurations (5.1) Trunk deck and inner deck plating at corners of openings for liquid and gas domes in membrane type liquefied gas carriers	Class III within 0.6*L* amidships Class II within rest of cargo region
	(6) Bilge strake in ships with double bottom over the full breadth and length less than 150 m	Class II within 0.6*L* amidships Class I outside 0.6*L* amidships
	(7) Bilge strake in other ships①	Class III within 0.4*L* amidships Class II outside 0.4*L* amidships Class I outside 0.6*L* amidships
	(8) Longitudinal hatch coamings of length greater than 0.15*L* including coaming top plate and flange (9) End brackets and deck house transition of longitudinal cargo hatch coamings	Class III within 0.4*L* amidships Class II outside 0.4*L* amidships Class I outside 0.6*L* amidships Not to be less than Grade D/DH

Note: ① Single strakes required to be of Class III within 0.4*L* amidships are to have breadths not less than 800 + 5*L* mm (*L* being the ship's length), need not be greater than 1,800 mm, unless limited by the geometry of the ship's design.

Minimum Material Grades for Ships with Length Exceeding 150 m and Single Strength Deck

Table 1.3.2.2(2)

Structural member category	Material grade
Longitudinal plating of strength deck where contributing to the longitudinal strength Continuous longitudinal plating of strength members above strength deck	Grade B/AH within 0.4*L* amidships
Single side strakes for ships without inner continuous longitudinal bulkhead(s) between bottom and the strength deck	Grade B/AH within cargo region

Note: This Table is applicable to ships other than the liquefied gas carriers covered in Table 1.3.2.2(3).

Minimum Material Grades for Membrane Type Liquefied Gas Carriers with Length Exceeding 150 m①

Table 1.3.2.2(3)

Structural member category		Material grade
Longitudinal plating of strength deck where contributing to the longitudinal strength		Grade B/AH within 0.4*L* amidships
Continuous longitudinal plating of strength members above the strength deck	Trunk deck plating	Class II within 0.4*L* amidships
	Inner deck plating Longitudinal strength member plating between the trunk deck and inner deck	Grade B/AH within 0.4*L* amidships

Note: ① Table 1.3.2.2(3) is applicable to membrane type liquefied gas carriers with deck arrangements as shown in Figure 1.3.2.2. Table 1.3.2.2(3) may apply to similar ship types with a 'double deck' arrangement above the strength deck.

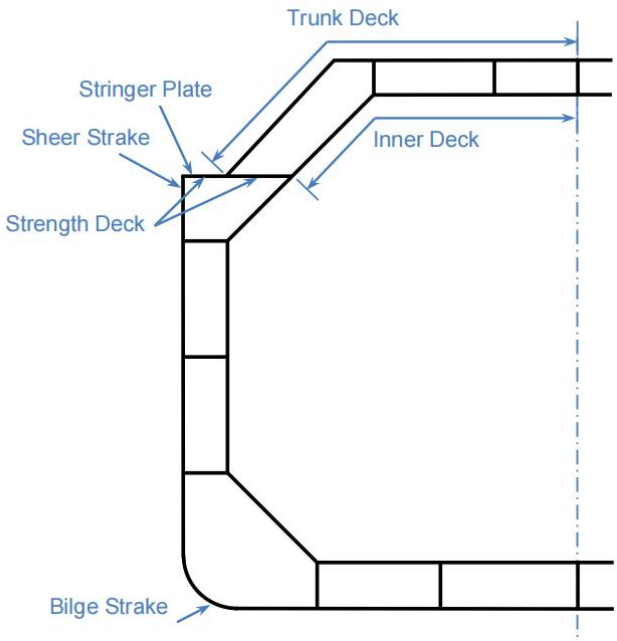

Figure 1.3.2.2 Typical Deck Arrangement for Membrane Tank Liquefied Gas Carriers

Minimum Material Grades for Ships with Length Exceeding 250 m **Table 1.3.2.2(4)**

Structural member category	Material grade
Shear strake at strength deck①	Grade E/EH within 0.4*L* amidships
Stringer plate in strength deck①	Grade E/EH within 0.4*L* amidships
Bilge strake①	Grade D/DH within 0.4*L* amidships

Note: ① Single strakes required to be of Grade D/DH or Grade E/EH as shown in the above table and within 0.4*L* amidships are to have breadths not less than 800 + 5*L* mm (*L* being the ship's length), need not be greater than 1800 (mm), unless limited by the geometry of the ship's design.

Minimum Material Grades for Single-Side Skin Bulk Carriers Subjected to SOLAS Reg. XII/6.4

Table 1.3.2.2(5)

Structural member category	Material grade
Lower bracket of ordinary side frame①②	Grade D/DH
Side shell strakes included totally or partially between the two points located to 0.125*l* above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate②	Grade D/DH

Notes: ① The term "lower bracket" means webs of lower brackets and webs of the lower part of side frames up to the point of 0.125*l* above the intersection of side shell and bilge hopper sloping plate or inner bottom plate.

② The span of the side frame, *l*, is defined as the distance between the supporting structures.

Minimum Material Grades for Ships with Ice Strengthening **Table 1.3.2.2(6)**

Structural member category	Material grade
Shell strakes in way of ice strengthening area for plates	Grade B/AH

Steel grade requirements for Material Classes **Table 1.3.2.2(7)**

Material class	I		II		III	
Thickness (mm)	Mild steel	Higher tensile steel	Mild steel	Higher tensile steel	Mild steel	Higher tensile steel
$t \leq 15$	A	AH	A	AH	A	AH
$15 < t \leq 20$	A	AH	A	AH	B	AH
$20 < t \leq 25$	A	AH	B	AH	D	DH
$25 < t \leq 30$	A	AH	D	DH	D	DH
$30 < t \leq 35$	B	AH	D	DH	E	EH
$35 < t \leq 40$	B	AH	D	DH	E	EH
$40 < t \leq 50$	D	DH	E	EH	E	EH

1.3.2.5 Plating materials for stern frames supporting the rudder and propeller boss, rudders, rudder horns and shaft brackets are, in general, not to be of lower grades than those corresponding to class II. For rudder and rudder body plates subjected to stress concentrations, e.g. in way of lower support of semi-spade rudders (i.e. rudder horn recess) or at upper part of spade rudders, class III is to be applied.

1.3.2.6 For ships of less than 90 m in length, single strakes required to be of class III within 0.4*L* amidships are to have breadths not less than 800 + 5*L* mm (*L* being length of the ship, in m), but need not be greater than 1,800 mm.

1.3.2.7 The material class used for reinforcement and the quality of materials (i.e. whether mild or higher tensile steel) used for welded attachments, such as backing bars of bilge keels, is generally to be similar to that of the hull envelope plating in way.

Where attachments are made to rounded gunwale plates, special consideration will be given to the required grade of steel, taking account of the intended structural arrangements and attachment details.

1.3.2.8 The material class for deck plating, sheer strake and upper strake of longitudinal bulkhead within 0.4 *L* amidships is also to be applied at the poop front and at the ends of the bridge.

1.3.2.9 In the case of container ships, the material class for strength deck, sheer strake and torsion box structure within 0.4 *L* amidships is also to be applied in way of the entire cargo area.

1.3.2.10 On tankers having a poop, the quality of strength deck plating extending forward of the poop to any pump room openings is to be kept unchanged.

1.3.2.11 For hull structures having T connections or cruciform connections, with full penetration welding, and plate material of which is subject to high tensile stress through thickness, the use of Z-direction steel plates having through thickness properties is recommended.

1.3.3 Requirements for steel used for refrigerated space structures

1.3.3.1 Where the minimum design temperature t_D of the steel falls below 0 ℃ in refrigerated spaces, in addition to the requirements of 1.3.2 of this Section, the steel grade for the deck plating, webs of deck girders, longitudinal bulkhead strakes attached to deck and beams for supporting hatchway covers and their face plates is to comply with the requirements of Table 1.3.3.1.

Steel Grade of Structural Members in Refrigerated Spaces **Table 1.3.3.1**

Thickness (mm)	-10℃≤t_D<0℃		-25℃≤t_D<-10℃		-40℃≤t_D<-25℃	
	Mild steel	Higher tensile steel	Mild steel	Higher tensile steel	Mild steel	Higher tensile steel
$t \leq 12.5$	B	AH	D	DH	E	EH
$12.5 < t \leq 25.5$	D	DH	E	EH	Specially considered①	Specially considered②
$t > 25.5$	E	EH	Specially considered①	Specially considered②	Specially considered①	Specially considered②

Notes: ① Austenitic stainless steel may generally be used.
② Grade FH may generally be used.

1.3.3.2 The minimum design temperature of the refrigerated space deck may be assessed by a temperature gradient calculation or may be determined in accordance with Table 1.3.3.2. Where one of the internal spaces concerned is not refrigerated, the temperature of the space is to be taken as 5℃.

Minimum Design Temperature of Refrigerated Space Deck **Table 1.3.3.2**

Item	Arrangement	Deck temperature
1	Deck not covered with insulation in the refrigerated space	Temperature of the refrigerated space
2	Deck covered with insulation in the refrigerated space and not insulated on the other side	Temperature of the space on the uninsulated side
3	Deck covered with insulation on both sides: (1) Temperature difference not greater than 11℃ (2) Temperature difference greater than 11℃ but not greater than 33℃	 Mean of the temperatures of the spaces above and below the deck Mean of the temperatures of the spaces above and below the deck less 3℃

1.3.4 Ships exposed to low air temperatures

1.3.4.1 For ships intended to operate in areas with low air temperatures (below -10℃), e.g. regular service during winter seasons to Arctic or Antarctic waters, the materials in exposed structures are to be selected based on the design temperature t_D. The design temperature t_D is to be taken as defined in 1.3.4.6.

1.3.4.2 Materials in the various strength members above the lowest ballast waterline (BWL) exposed to low air temperatures (including the plating covered by note ⑤ of Table 1.3.4.2) and materials of cargo tank boundary plating to which 1.3.4.7 is applicable are not to be lower than those as given in Table 1.3.4.2. For non-exposed hull structural steel above BWL (except for ⑤ as indicated in Table 1.3.4.2) and hull structural steel below BWL, the requirements in 1.3.2 of this Section apply.

1.3.4.3 Grades of steel for hull structural members of different material classes are to be selected according to Table 1.3.4.3 depending on plate thickness and design temperature. Where the design temperature t_D is below -55℃, the grades of steel are to be subject to special consideration by CCS.

1.3.4.4 Single strakes required to be of class III or of grade E/EH or FH are to have breadths not less than $800 + 5L$ mm (L being length of the ship, in m), but need not be greater than 1,800 mm.

1.3.4.5 Plating materials for stern frames, rudders, rudder horns and shaft brackets are not to be of lower grades than those required in 1.3.2 of this Section.

Material Classes at Low Temperatures **Table 1.3.4.2**

Structural member category	Structural member	Material class	
		Within 0.4L amidships	Outside 0.4L amidships
Secondary	Deck plating exposed to weather in general, side plating above BWL, transverse bulkheads above BWL⑤ Cargo tank boundary plating exposed to cold cargo⑥	I	I
Primary	Strength deck plating① Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings Longitudinal bulkhead above BWL⑤ Top wing tank bulkhead above BWL⑤	II	I

Structural member category	Structural member	Material class	
		Within 0.4*L* amidships	Outside 0.4*L* amidships
Special	Sheer strake at strength deck, including rounded gunwale② Stringer plate in strength deck② Deck strake at longitudinal bulkhead③ Continuous longitudinal hatch coamings④	III	II

Notes: ① Plating at corners of large hatch openings to be specially considered. Class III or grade E/EH to be applied in positions where high local stresses may occur.

② Not to be less than grade E/EH within 0.4 *L* amidships in ships with length exceeding 250 m.

③ In ships with breadth exceeding 70 m at least three deck strakes to be class III.

④ Not to be less than grade D/DH.

⑤ Applicable to plating attached to hull envelope plating exposed to low air temperature. At least one strake is to be considered in the same way as exposed plating and the strake width is to be at least 600 mm.

⑥ For cargo tank boundary plating exposed to cold cargo for ships other than liquefied gas carriers, the requirements of 1.3.4.7 are to be satisfied.

Material Grade Requirements for Classes I, II and III at Low Temperatures Table 1.3.4.3

Class I										
Plate thickness, in mm	-11～-15℃		-16～-25℃		-26～-35℃		-36～-45℃		-46～-55℃

$40 < t \leq 50$	E	EH	–	FH	–	FH	–	–	–	–

Note: "–" in the Table = Not applicable.

1.3.4.6 The design temperature t_D is to be taken as the lowest mean daily average air temperature in the area of operation, where:

mean: statistical mean over observation period;

daily average: average during one day and night;

lowest: lowest during year.

For seasonally restricted service the lowest value within the period of operation applies.

Figure 1.3.4.6 illustrates the temperature definition.

For the purpose of issuing a Polar Ship Certificate in accordance with the Polar Code, the design temperature t_D is to be no more than 13℃ higher than the Polar Service Temperature (PST) of the ship.

In the Polar Regions, the statistical mean over observation period is to be determined for a period of at least 10 years.

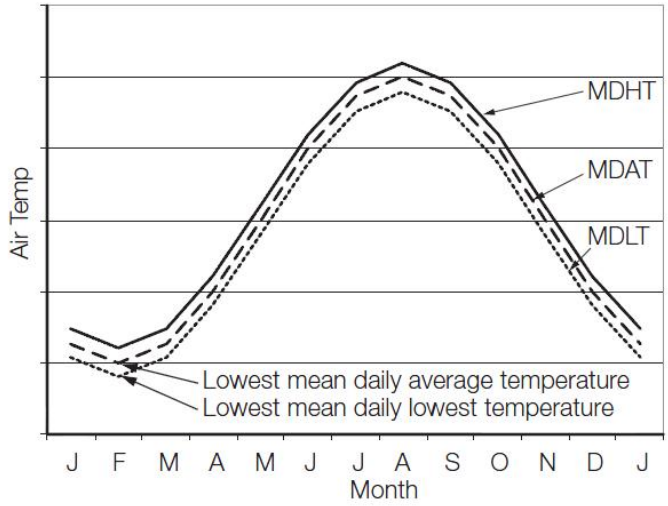

Figure 1.3.4.6 General Temperature Definitions

1.3.4.7 Cold cargo for ships other than liquefied gas carriers

For ships other than liquefied gas carriers, intended to be loaded with liquid cargo having a temperature below -10℃, e.g. loading from cold onshore storage tanks during winter conditions, the material grade of cargo tank boundary plating is defined in Table 1.3.4.3 based on the following:

(1) t_c design minimum cargo temperature in ℃;

(2) steel grade corresponding to Class I as given in Table 1.3.4.2.

The design minimum cargo temperature, t_c is to be specified in the loading manual.

1.3.5 Use of aluminium alloy

1.3.5.1 The use of aluminum alloy is permitted for superstructures, deckhouses, hatch covers, or other similar structures, based on equivalent strength, instead of hull structural steel as required in the Rules. The chemical composition and mechanical properties of aluminum alloys used are to comply with the relevant requirements of Chapter 8, PART ONE of CCS Rules for Materials and Welding.

1.3.5.2 Unless stated otherwise, the modulus of elasticity of aluminium alloy may be taken as 70,000 N/mm².

1.3.5.3 The scantlings of aluminium alloy structures may be obtained from the following formulae:

For plating thickness: $t_a = t_s \sqrt{K_a}$ mm

For section modulus: $W_a = W_s K_a$ cm³

where:

t_s — thickness of mild steel plating as required in the Rules, in mm;

W_s — section modulus of mild steel as required in the Rules, in cm³;

K_a — material factor for aluminium alloy, $K_a = \frac{235}{R'_{\text{lim}}}$;

R'_{lim} — the minimum yield stress $R'_{p0.2}$ of parent material which could be guaranteed under welding condition, in N/mm², to be taken not greater than 70% minimum tensile strength R'_m of parent material which could be guaranteed under welding condition:

$$R'_{p0.2} = \eta_1 R_{p0.2}$$

$$R'_m = \eta_2 R_m ;$$

$R_{p0.2}$ — the minimum yield stress of parent material which could be guaranteed under delivery condition, in N/mm²;

R_m — the minimum tensile strength of parent material which could be guaranteed under delivery condition, in N/mm². η_1 and η_2 are given in Table 1.3.5.3(1).

Aluminium Alloy used for Welded Structures **Table 1.3.5.3(1)**

Aluminium alloy	η_1	η_2
Not treated by hardening (5000 series under annealed condition O or annealing leveling condition H111)	1	1
Treated by hardening (5000 series other than O or H111)	$R'_{p0.2}/R_{p0.2}$	R'_m/R_m
Heat treated and hardened (6000 series) (1)	$R'_{p0.2}/R_{p0.2}$	0.6

Note: (1) If information is not provided, the factor η_1 is to be taken as metallographic efficiency coefficient β defined in Table 1.3.5.3(2);

$R'_{p0.2}$ — the minimum yield stress of material which could be guaranteed under welding condition, in N/mm^2;

R'_m — the minimum tensile strength of material which could be guaranteed under welding condition, in N/mm^2.

Alunimun Alloy — Metallographic Efficiency Coefficient β **Table 1.3.5.3(2)**

Aluminium alloy	Tempering condition	Total thickness (mm)	β
6005A (opening section)	T5 or T6	$t \le 6$	0.45
		$t > 6$	0.40
6005A (closed section)	T5 or T6	All	0.50
6061 (section)	T6	All	0.53
6082 (section)	T6	All	0.45

1.3.5.4 The welding procedures for aluminium alloy are to be subject to approval. The methods used for connecting aluminium alloy with steel members and the information for measures to be taken for corrosion control are to be submitted to CCS for examination.

1.3.6 Use of stainless steel

1.3.6.1 Stainless steel may be used for tanks onboard oil tankers and chemical tankers to equivalently substitute the hull structure steels required in the Rules.

1.3.6.2 Except where otherwise stated, the elastic modulus of stainless steel may be taken as 2.06×10^5 N/mm^2.

1.3.6.3 The material factor K is to be calculated by the following formula:

$$K=\frac{235}{R_{eHT}}$$

where: R_{eHT} — the minimum yield strength or non-proportional extension strength of stainless steel under the designed allowable maximum cargo temperature, in N/mm^2, to be calculated by the following formulae:

for no nitrogen austenitic stainless steel:

$$R_{eHT}=-40\ln(T)+127+R_{P0.2};$$

for nitrogen austenitic stainless steel:

$$R_{eHT}=-48\ln(T)+142+R_{P0.2};$$

for duplex stainless steel:

$$R_{eHT}=-65\ln(T)+200+R_{P0.2}.$$

T — the designed allowable maximum cargo temperature, in℃;

$R_{p0.2}$ — the minimum yield strength or non-proportional extension strength of stainless steel, in N/mm^2 at room temperature, in accordance with the relevant requirements of Section 8, Chapter 3, PART ONE of CCS Rules for Materials and Welding.

For duplex stainless steel, K is not to be less than 0.68.

Section 4 WELD DESIGN FOR HULL STRUCTURES

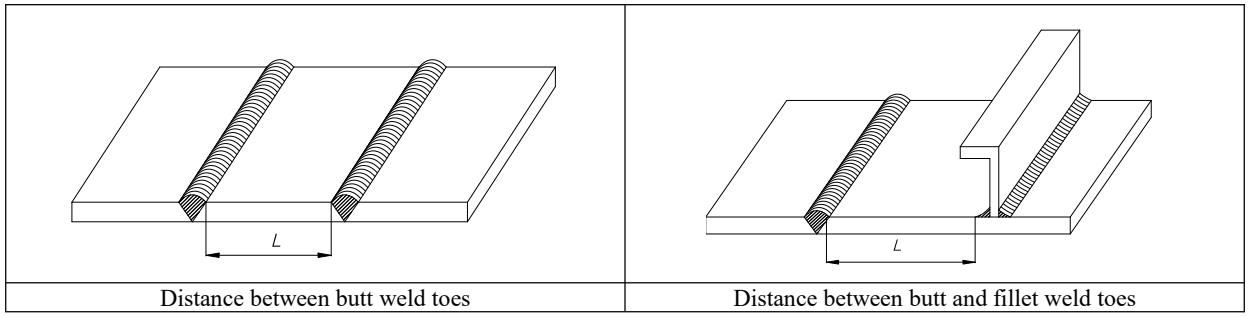
1.4.1 General requirements

1.4.1.1 This Section applies to the weld design for normal hull structures and components. Welding procedures for the construction of hull are to comply with the relevant requirements of CCS Rules for Materials and Welding.

1.4.1.2 The arrangement of welds in hull structures is to be such as to allow adequate access for completion of all welding operations. Welded joints are to be so arranged as to facilitate the use of flat (downhand) welding wherever possible.

1.4.1.3 Where welding is used for hull structures, care is to be taken to avoid the arrangement of welded joints in positions of stress concentration. Adequate transition is to be made in way of the abrupt changes of shape or section, and excessive concentration of welds over such positions is to be avoided.

1.4.1.4 Parallel welded seams in the main hull structures are to be spaced an adequate distance apart. The distance l_1 between two parallel butt welded seams is not to be less than 100 mm, and the butt welded seams are not to be intersected with an acute angle. Where a butt welded seam is in parallel with a fillet welded seam, the distance l_2 between them is not to be less than 10 mm. The distance between the above two welded seams is in general the distance between inner edges of two weld toes (as shown in Figure 1.4.1.4).



Distance between butt weld toes | Distance between butt and fillet weld toes

Figure 1.4.1.4 Distance between parallel welded seams

1.4.1.5 The shell plating, deck plating, inner bottom plating and bulkhead plating are all to be connected by butt welds.

1.4.1.6 Overlaps are generally not to be used to connect plates in hull structures, particularly for plates which may be subjected to high stress.

1.4.1.7 The use of permanent backing bars in highly stressed welds in hull structures is to be avoided as far as possible.

1.4.1.8 Double continuous fillet welding is to be adopted in the following locations:

(1) boundaries of weathertight decks and erections, including hatch coamings, companionways and coamings of other openings;

(2) boundaries of tanks and watertight compartments;

(3) connections in foundations and supporting structures;

(4) all structure in the aft peak and the aft peak bulkhead stiffeners;

(5) all welding inside tanks intended for chemicals or edible liquid cargoes;

(6) main frames and their upper and lower brackets in cargo holds of bulk carriers to side shell plating and sloped bulkhead plating of topside tanks and hopper side tanks;

(7) all lap welds in tanks;

(8) primary and secondary members to bottom shell in the 0.25 L forward;

(9) centreline girder to keel plate;

(10) boundaries of galleys, pantries, laundry rooms, bathrooms, toilets and storage battery rooms, etc.;

(11) primary and secondary members to plating in way of end connections, and end brackets to plating in the case of lap connections;

(12) other special connections or attachments, and in particular the attachment of minor fittings to higher tensile steel plating, will be specially considered.

1.4.1.9 Where higher tensile steel is used, double continuous fillet welds are normally to be adopted.

1.4.1.10 Details of the welded connections of main structural members of the hull, including type and size of welds, are to be clearly indicated on the plans submitted for approval. The extent to which automatic welding is used is to be indicated on the plans.

1.4.1.11 When arranging side joints of shell plating, the arrangement of longitudinal members such as deck plating, longitudinals and inner bottom margin plates are to be taken into account, avoiding coincidence of the side joints and fillet welds of longitudinal members or their intersection to an excessively small angle. The butt welds of end joint of the shell are to avoid the toes of internal longitudinal members and the fillet welding of transverse members as far as practicable.

1.4.2 Welding consumables

1.4.2.1 Welding consumables used for hull structures are to comply with the requirements of CCS Rules for Materials and Welding. The grade of welding consumables selected is to be suitable for the grade of hull structural steel, and is to comply with the requirements of Table 1.4.2.1. Welding consumables of H47 steels are to be selected by referring to CCS Guidelines for Application of Thick Higher Strength Steel Plates for Ships and welding consumables of other steels are to be selected by referring to CCS Guidelines for Inspection of Hull Welds.

Selection of Welding Consumables **Table 1.4.2.1**

Hull structural steel grade / Grade of welding consumables	A	B	D	E	AH27 AH32 AH36	DH27 DH32 DH36	EH27 EH32 EH36	FH27 FH32 FH36	AH40	DH40	EH40	FH40
1	×											
2	×	×	×									
3	×	×	×	×								
1Y	×				×②							
2Y	×	×	×		×	×						
3Y	×	×	×	×	×	×	×					
4Y	×	×	×	×	×	×	×	×				
2Y40	①	①	①		×	×			×	×		
3Y40	①	①	①	①	×	×	×		×	×	×	
4Y40	①	①	①	①	×	×	×	×	×	×	×	×
5Y40	①	①	①	①	×	×	×	×	×	×	×	×

Notes: "×" means applicable;

① When joining structural steels of normal strength, it is not recommended to use a much higher grade of welding consumable.

② When using Grade 1Y welding consumables, the material thicknesses should not exceed 25 mm.

1.4.2.2 For the joining of steels of different strength levels, the welding consumables in general may be of a type suitable for the lower strength level except at structural discontinuities or areas of stress concentration. For the joining of steels of the same strength level but of different toughness grades, the welding consumables in general may be of a type suitable for the lower toughness grade except for the structural members subjected to complicated forces or severe construction conditions.

1.4.2.3 Low hydrogen welding consumables are to be used for the welding of the following structural members and components:

(1) Circumferential butt welds in the joining of block sections and butt welds of girders;

(2) End and side joints of the shell of ships with ice strengthening;

(3) Masts, derricks, boat davits, bollards and other outfits subjected to heavy loads and all other highly stressed fittings;

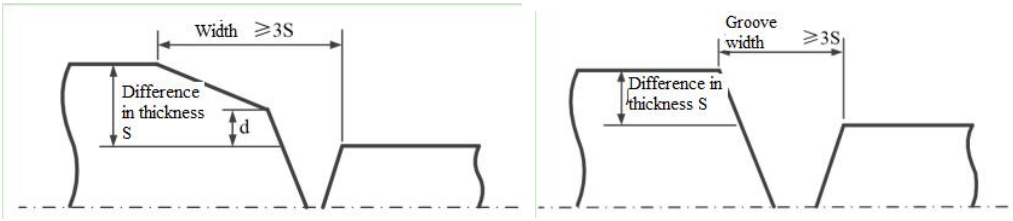
(4) Components for which high rigidity is required, such as stems, stern frames, propeller shaft brackets, and joints between them and the shell plating and the hull framing;

(5) Main engine seatings and the associated structural members.

1.4.2.4 It is recommended that low hydrogen welding consumables be used for the joining of higher strength structural steel or of steel with carbon equivalent over 0.41%.

1.4.3 Butt, lap and slot welds

1.4.3.1 Where plates of different thicknesses are to be butt welded and the difference in thickness of one side is less than or equal to 4 mm, the transition may be achieved within the width of the weld. Where the difference in thickness of one side is greater than 4 mm, the edge of the thicker plate is to be tapered so as to ensure a uniform transition with the weld. The width is not to be less than 3 times the difference in thickness of one side, and the difference in height of the two sides of the groove d is not to be greater than 4 mm, as shown in Figure 1.4.3.1(1). Where the groove width is not less than 3 times the difference in thickness of one side, taper may not be necessary and the transition may be achieved within the width of the weld, as shown in Figure 1.4.3.1(2).



(1) (2)

Figure 1.4.3.1 Butt welding of steel plates of different thickness

1.4.3.2 Overlaps are generally not to be used to connect plates which may be subjected to high tensile stress or compressive loading. Where plate overlaps are adopted, the breadth (*b*) of the overlap is not to exceed four times nor be less than three times the thickness of the thinner plate, see Figure 1.4.3.2. The joints are to be positioned as to allow adequate access for completion of sound welds. The faying surfaces of lap joints are to be in close contact and both edges of the overlap are to have continuous fillet welds.

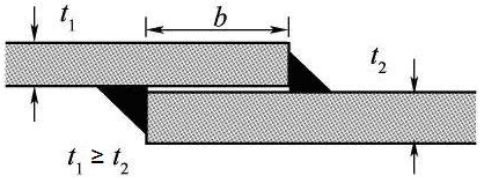


Figure 1.4.3.2

1.4.3.3 For the connection of plating to internal webs, where access for fillet welding is not practicable, the closing plating is to be attached by continuous full penetration welds or slot fillet welds to face plates fitted to the webs. Slots are to have a minimum length of 75 mm and a minimum width of twice the plating thickness, with well rounded ends, and spaced not more than 150 mm apart. Slots are normally not to be filled with welding.

1.4.4 Fillet welds

1.4.4.1 T-connections of hull structures are generally to be made by fillet welds on both sides of the abutting plate, including fillet welds, partial penetration fillet welds and full penetration fillet welds. The types and application of fillet welds are to be as shown in Table 1.4.4.1.

1.4.4.2 The size of fillet welds for hull structural connection is to be determined as follows:

(1) The throat thickness *h* of fillet welds is to be determined from the following formula:

$$h = w_\tau t_p \frac{d}{l} \quad \text{mm}$$

where: t_p — thickness of the thinner plate of the abutting plates, in mm, e.g. t_1 or t_2 in item 1 of Table 1.4.4.1 of this Section, whichever is the lesser;

d — distance between weld fillets, in mm, i.e. the distance between start positions of successive weld fillets for intermittent welding, as shown in items Figure 1.4.4.2 of this Section; where the fillet weld is continuous, d is to be equal to l;

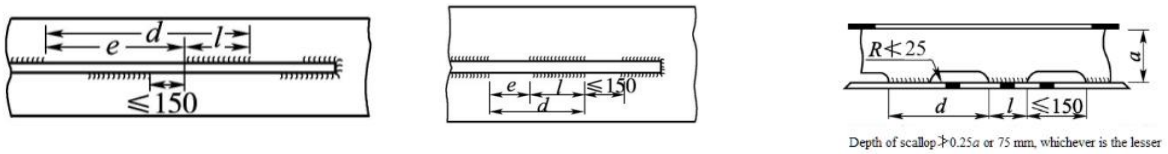
l — the length of weld fillet, in mm, clear of end craters, and is not to be less than 75 mm;

w_τ — weld factor. The weld factors used for hull structures are as specified in Table 1.4.4.2 of this Section. Where an approved automatic deep penetration procedure is used, W_τ may be 85% of the value given in the Table.

The fillet leg length *K* is not to be less than the value obtained from the following formula:

$$K = \sqrt{2}h \text{ mm}$$

(2) In case of full penetration welding, there is no requirement for root face. For partial penetration welds the root face, *f*, is, to be taken between 3 mm and 1/3*t*. The groove angle made to ensure welding bead penetrating up to the root of the groove, α, is usually from 40° to 60°. The welding bead of the full/partial penetration welds is to cover root of the groove.



l – length of weld, e – spacing of welds, d – distance between weld fillets, welding to be carried round both ends of plating for intermittent fillet welds and ends of all lugs for scalloped construction.

Figure 1.4.4.2

Types of Fillet Welds **Table 1.4.4.1**

Item	Fillet weld	Type	Remark
1	Double continuous		Used for ordinary connection K – leg length h – throat thickness t_1, t_2 – thickness of plates
2	Double full penetration welding		Used in areas with high tensile stresses or areas considered critical α — groove angle
3	Double symmetrical groove partial penetration welding		Used in areas with relatively high tensile stresses or areas considered critical t —thickness of weldment f—root face α —groove angle
4	Double asymmetrical groove partial penetration welding		Used in areas with relatively high tensile stresses or areas considered critical t —thickness of weldment f—root face α —groove angle

Weld Factors **Table 1.4.4.2**

Item		Weld factor	Remark
1 General application (except as required below):			
(1) Watertight or oiltight plate boundaries		0.34	
(2) Non-tight plate boundaries		0.13	
(3) Longitudinals, frames, beams, and other secondary members to shell, deck or bulkhead plating		0.10	
		0.13	In tanks
		0.21	In way of end connections
(4) Panel stiffeners (i.e. small stiffeners)		0.10	
(5) Overlap welds		0.27	
(6) Longitudinals of the flat-bar type to plating		0.21	Double continuous
2 Bottom construction in way of holds or tanks			
(1) Tight centre girder	to keel	0.44	
	to inner bottom	0.44	
(2) Non-tight centre girder (or centre keelson)	to keel	0.27	
	to inner bottom (or face plate of centre keelson)	0.21	No scallops
(3) Tight boundaries of floors, girders		0.39	
(4) Non-tight boundaries of floors, girders (or side keelson) and brackets		0.16	
		0.21	In way of 0.2 × span at ends
		0.27	In way of brackets at lower end of main frame
(5) Inner bottom longitudinals or reverse frames to inner bottom		0.13	Under holds strengthened for heavy cargoes
(6) Floors supporting plane, corrugated, double plate bulkheads and bulkhead stools to inner bottom		0.44	Double continuous
3 Hull framing			
(1) Webs of web frames and stringers to shell		0.16	
(2) Webs of web frames and stringers to face plate		0.13	
(3) Tank side brackets to shell and inner bottom		0.34	
(4) Main frames of cargo holds in bulk carriers to shell plating		0.40	See 8.3.6 in this PART
(5) End brackets of main frames of cargo holds in bulk carriers		0.44	See 8.3.6 in this PART
4 Decks and supporting structure			
(1) Strength deck plating to shell		0.44	See 5.2.5 of PART THREE of CCS Rules for Materials and Welding Generally double continuous
(2) Other decks to shell and bulkheads (except where forming tank boundaries)		0.21	
(3) Webs of cantilevers to deck and to shell in way of root bracket		0.44	
(4) Webs of cantilevers to face plate		0.21	
(5) Pillars:	end connections	0.34	0.21 in a length of 0.15 span of hatch girders at ends
	end connections (tubular)	0.44	
(6) Girder web connections and brackets in way of pillar heads and heels		0.21	
(7) Web plates of hatch girders and deck web beams to deck, their face plates		0.16	
5 Bulkheads and tank construction			
(1) Watertight plane, corrugated, double plate bulkheads to bottom, inner bottom, bilge plating, hopper and topside tanks, decks and face plates of		0.44	

Item		Weld factor	Remark
bulkhead stools			
(2) Upper and lower bulkhead stool plates to their face plates		0.44	Full penetration in way of lower stool
(3) Bulkhead stool plates to inner bottom, deck and bilge		0.44	
(4) Bulkhead plating to side shell		0.34	
(5) Bulkhead plating to secondary members where acting as pillars		0.13	
(6) Non-watertight pillar bulkhead boundaries		0.13	
(7) Perforated flats and wash bulkhead boundaries		0.10	
6 Structure in cargo tanks of oil tankers			
(1) Bottom longitudinals to shell		0.21	For forward of 0.25L
(2) Connections between primary structural members		0.44	At bottom
		0.34	At deck
(3) Longitudinal oiltight bulkhead boundaries		0.44	Throat thickness $h \geq 0.34t$, t being bulkhead thickness, in mm
(4)	Transverse oiltight bulkhead to bottom	0.44	Throat thickness $h \geq 0.34t$, t being bulkhead thickness, in mm
	Transverse oiltight bulkhead to deck, sides and longitudinal bulkhead	0.34	
(5) Non-tight bulkhead boundaries		0.21	Generally
(6) Boundaries of non-watertight girders and floors in double bottom		0.34	Within 0.2L at ends of ship
		0.40	Under bulkhead stools
		0.44	
(7) Frames rings in hopper and topside tanks to shell, deck and sloping (top) plating		0.34	
(8) Boundaries of diaphragms or frame rings, side girders in double hull		0.34	Generally
		0.40	Within 0.2L at ends of ship
(9) Between primary structural members in double hull, double bottom, hopper tanks and topside tanks		0.34	
(10) Longitudinal girders or frame rings to face plates in hopper tanks, topside tanks and double hull		0.27	
(11) Web plates of primary structural members in cargo tanks to longitudinal and transverse bulkheads, inner bottom and deck		0.34	Generally
		0.44	Within 0.2L at ends of ship
(12) Web plates of primary structural members in cargo tanks to face plates		0.27	Generally
		0.34	Within 0.2L at ends of ship
7 Structure in hoppers of hopper dredgers			
(1) Bulkhead boundary connections		0.44	At bottom and bilge
		0.34	At deck and coamings
(2) Cross members to longitudinal bulkheads		0.44	
(3) Pillar end connections		0.34	
(4) Hopper door hinges of self-unloading ships		0.44	Partial penetration
8 Structure in machinery space			
(1) Non-tight centre girder (or centre keelson) to keel and inner bottom (or face plate of centre keelson)		0.27	
(2) Non-tight floors to centre girder (or centre keelson) in way of engine, thrust and boiler bearers		0.27	
(3) Non-tight floors and girders (or side keelsons) to shell and inner bottom		0.21	Partial penetration, girders to be tapered to both sides, root face ≤ 1/3 girder thickness
(4)	Main engine foundation girders to top plate	0.44	
	Main engine foundation girders to hull structure	0.44	

Item			Weld factor	Remark
	Floors to main engine foundation girders		0.27	
	Brackets to main engine foundation girders		0.21	
(5) Transverse and longitudinal framing to shell			0.13	
9 Construction in 0.25*L* forward				
(1) Floors and girders (or centre keelson, etc.) to shell and inner bottom			0.21	
(2) Bottom longitudinals to shell			0.13	
(3) Transverse and longitudinal side framing to shell			0.13	
(4) Tank side brackets to frame and inner bottom			0.34	
(5) Panting stringers to shell and frames			0.34	
(6) All internal structure in fore peak			0.13	Unless a greater weld factor is required
10 Aft peak construction: All internal structure including stiffeners on aft peak bulkhead			0.21	Unless a greater weld factor is required
11 Superstructure and deckhouses				
(1) Connection of external bulkheads to deck			0.34	1st and 2nd tier erections
			0.21	Elsewhere
(2) Internal bulkheads to deck			0.13	
12 Hatchways and closing arrangements				
(1) Hatch coamings to deck			0.34	0.44 at corners
(2) Hatch coaming stays (stiffeners, brackets)		To coaming	0.13	
		To deck	0.21	
(3) Hatch cover rest bar			0.16	
(4) Cleats and fittings			0.44	Increased welding may be required
(5) Primary and secondary stiffening of hatch covers			0.10	0.13 for tank covers and where covers strengthened for loads over
13 Steering control systems				
(1) Rudder	① Fabricated mainpiece and mainpiece to side plates and webs		0.44	
	② Slot welds inside plates		0.44	
	③ Remaining construction		0.21	
(2) Fixed and steering nozzles		Main structure	0.44	
		Elsewhere	0.21	
(3) Thruster units and stabilizers		Main structure	0.44	
		Elsewhere	0.21	
14 Miscellaneous fittings and equipment				
(1) Rings for manhole type covers to deck, inner bottom or bulkhead			0.34	
(2) Frames of shell and weathertight bulkhead doors			0.34	
(3) Stiffening of watertight doors			0.21	
(4) Ventilator, air pipe, etc., coamings		To deck	0.34	Positions 1 and 2 specified by Load Line assignment
		Elsewhere	0.21	
(5) Ventilator, etc., fittings			0.21	
(6) Scuppers and discharges, to deck			0.44	
(7) Masts, derrick posts, crane pedestals, etc., to deck			0.44	See 5.2.7 of PART THREE of CCS Rules for Materials and Welding
(8) Deck machinery seats to deck			0.21	Special equipment subject to design

Item	Weld factor	Remark
(9) Mooring equipment (bollards, etc.) seats to deck	0.21	Increased or full penetration welding may be required
(10) Bulwark stays to deck	0.21	
(11) Bulwark attachment and guard rails, stanchions, etc., to deck	0.34	
(12) Bilge keel backing bars to shell	0.34	
(13) Bilge keels to backing bars	0.21	

1.4.4.3 Where the thickness of the abutting member of the T connection (e.g. the web of a stiffener or longitudinal) is greater than 15 mm and exceeds the thickness of the table member (e.g. bulkhead plating, shell plating or deck plating), the welding is to be double continuous and the throat thickness h of the weld is to be neither less than the value given in Table 1.4.4.4(2) of this Section, nor less than the greater of the following:

$$h = 0.5Ct_v \quad \text{mm}$$

$$h = 0.21t_h \quad \text{mm}$$

where: t_v — thickness of the abutting member, in mm;

t_h — thickness of the table member, in mm;

C — coefficient, 0.21 for dry cargo holds, or 0.27 for liquid tanks.

1.4.4.4 Except as permitted by 1.4.4.2 and 1.4.4.3 of this Section, the throat thickness of all fillet welds is to comply with the following requirements:

(1) The limits of throat thickness are to be as shown in Table 1.4.4.4(1);

(2) The minimum value of throat thickness is also to comply with the requirements of Table 1.4.4.4(2).

Limits of Throat Thickness **Table 1.4.4.4(1)**

Item	Limits of throat thickness (mm)	
	Minimum	Maximum
Double continuous welding	0.21 t_p	0.44 t_p
Intermittent welding	0.27 t_p	0.44 t_p

Notes: ① For t_p, see 1.4.4.2(1) of this Section.

② When the actual plate thickness t_p' exceeds 25 mm, $t_p = 0.5(t_p' + 25)$.

Minimum Throat Thickness **Table 1.4.4.4(2)**

Plate thickness t_p		≤ 7.5	> 7.5
Minimum throat thickness (mm)	Manual or automatic welding	3	3.25
	Automatic deep penetration welding	3	3

Note: For t_p, see 1.4.4.2(1) of this Section.

1.4.4.5 Where intermittent fillet welds are used for the connection of hull members, double continuous fillet welding is to be carried out for a specified length of round-the-end weld in the following locations:

(1) The length of the round-the-end weld at the ends of brackets is not to be less than the depth of the connecting members, nor less than 75 mm.

(2) Where the ends of sections, particularly of short sections, are snipped off, the length of the round-the-end weld is to be not less than the height of such sections or the length of snipping.

(3) Where fillet welding is used in way of brackets, lugs and scallops and at the orthogonal connections with other members, the length of the round-the-end weld is not to be less than 75 mm for plate thickness > 12 mm, and not less than 50 mm for plate thickness ≤ 12 mm.

1.4.4.6 Where scallops are cut in the structural members for intermittent welding, both ends of the scallop are to be rounded and smooth. But no scallops are permitted in the following positions:

(1) in way of the ends of brackets where stress concentration occurs;

(2) in the main frames, longitudinals and stiffeners for a region of at least 230 mm on each side of the intersection with a primary supporting member.

1.4.4.7 Where a structural member passes through a watertight or an oiltight bulkhead, in addition to the fitting of a welded collar on the bulkhead, a small semicircular notch is to be cut on one side of the passing

member as shown in Figure 1.4.4.7(1). And double continuous fillet welding is to be carried out round the end of the semicircular notch to the bulkhead so as to ensure tightness of the bulkhead.

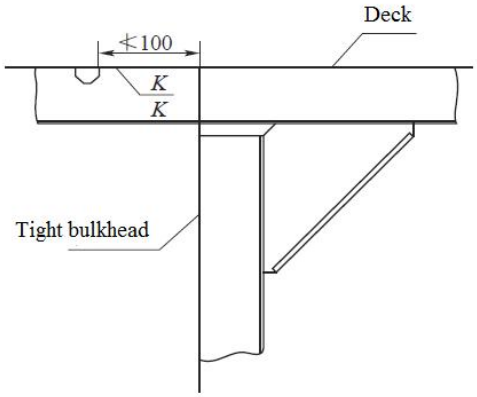


Figure 1.4.4.7(1)

For bulkheads adjacent to tanks, fillet welds in way of 150 mm fore and aft of oil/gastight or watertight bulkheads are to be properly beveled and full penetration is required in order to prevent the leakage of dangerous gases or liquids into adjacent compartments, see Figure 1.4.4.7(2). Other equivalent means may also be adopted.

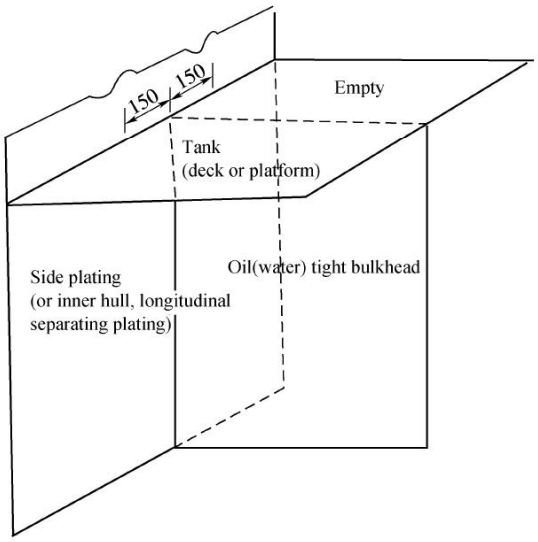

Figure 1.4.4.7(2)

1.4.4.8 The size of fillet welds in primary members is to comply with the following:
(1) Weld factors may be obtained from Table 1.4.4.8.

Weld Factors of Primary Members **Table 1.4.4.8**

Cross-sectional area of face plate of T-type members (cm^2)	Position①	In tanks		In dry spaces	
		To face plate	To plating	To face plate	To plating
		w_τ	w_τ	w_τ	w_τ
$A \le 30$	At ends	0.21	0.27	0.21	0.21
	Remainder	0.10	0.16	0.10	0.13
$30 < A \le 65$	At ends	0.21	0.34	0.21	0.21
	Remainder	0.13	0.27	0.13	0.16
$65 < A \le 95$	At ends	0.34	0.44③	0.21	0.27
	Remainder	0.27②	0.34	0.16	0.21
$95 < A \le 130$	At ends	0.34	0.44③	0.27	0.34
	Remainder	0.27②	0.34	0.21	0.27
A > 130	At ends	0.44	0.44③	0.34	0.44③
	Remainder	0.34	0.34	0.27	0.34

Notes: ① The weld factors "at ends" are to be applied for 0.2 × the length of the member from each end, but at least beyond the toes of the member end brackets. On vertical webs the increased welding may be omitted at the top, but is to extend at least 0.3 × length from the bottom. "Length of the member" means the overall length of the member (including the end brackets).

② In cargo oil tanks, the weld factor is to be 0.34. The final throat thickness of the weld fillet is not to be less than 0.34 t_p. For t_p, see 1.4.4.2(1) of this Section.

③ Where the web plate thickness is increased locally, the throat thickness is to be determined by 0.44 t_p or 0.34 t_c, whichever is the greater. For t_p, see 1.4.4.2(1) of this Section, and t_c is the increased thickness of plate.

④ In oil tankers over 120 m in length, the weld factors of the connection of bottom transverses to shell, and of side transverses to shell and vertical webs to longitudinal and transverse bulkheads, all in the lower half depth, are not to be less than 0.34.

(2) Where the webs of primary members are cut for the passage of secondary members and the width of the notch exceeds 15% of the stiffener spacing, the weld factor W_τ or the leg length K of fillet weld is to be multiplied by coefficient C obtained from the following formula:

$$C = \frac{0.85 \times \text{stiffener spacing}}{\text{length of web plating between notches}}$$

(3) In calculation of the throat thickness, the overall length of the weld at the ends of the member may be taken into account.

1.4.4.9 The area of welding of end connections of primary members is not to be less than the cross-sectional area of the member, and the weld factor is not to be less than 0.34 in tanks or 0.27 elsewhere.

1.4.4.10 Where a longitudinal strength member is cut at a primary support and the continuity of strength is provided by brackets, the area A_w of weld is not to be less than the cross-sectional area of the strength member.

1.4.4.11 Where the secondary member passes through, and is supported by, the web of a primary member, the weld connection is to be in accordance with the following:

(1) The area A_w of weld is to be not less than 0.5 $\sqrt{W}$ and the weld factor not less than 0.34 in tanks or 0.27 in dry spaces, where W is the section modulus of the secondary member, in cm^3.

(2) In cargo oil tanks, the size of weld is to be increased by 20% above that obtained from (1) above.

1.4.4.12 The fillet welding of secondary member end connections is to be in accordance with Table 1.4.4.12 and where two values are given, the greater is to be taken.

Weld Factors of End Connections of Secondary Members **Table 1.4.4.12**

Connection	Weld area A_w (cm^2)	Weld factor w_τ
1. Stiffener welded direct to deck, shell, bulkhead plating etc.	0.25 A_s or 6.5	0.34
2. Stiffener to bracket or bracket lapped to stiffener (1) in dry space (2) in tank (3) main frame to tank side bracket in 0.15L forward		 0.27 0.34 0.34
3. Bracket welded to face of stiffener and bracket connection to shell, deck, bulkhead plating, etc.	–	0.34
4. Stiffener to plating for 0.1 × span at ends where not fixed by welding	–	0.34

Notes: A_s – cross-sectional area of the stiffener, in cm^2;

A_w – area of the weld (in cm^2), and is calculated as total length of weld (in cm) × throat thickness (in cm).

1.4.4.13 Single-sided continuous fillet welding may be acceptable for dry spaces in deckhouse. Where this is adopted, the fillet leg length K is to be 2 times the value calculated in 1.4.4.2, where d / l is to be taken as 1.

Section 5 DIRECT STRENGTH CALCULATIONS

1.5.1 General requirements

1.5.1.1 Where specifically required in this PART, or a novel structural configuration is adopted, or structural arrangements, ship's proportions and scantlings are not covered by the Rules, direct calculations are to be performed.

1.5.1.2 Except as otherwise specified, this Section in general applies to finite element (FE) analysis of cargo holds and the whole ship.

1.5.1.3 The loading conditions taken into account for direct strength calculations are to include most severe conditions for the design of ships.

1.5.1.4 The as-built thicknesses are to be applied for FE model scantlings, no additional thickness given by the shipowner is to be taken into consideration.
1.5.1.5 Except as otherwise specified, the structural scantlings required by this PART can not be reduced for the direct strength calculation.
1.5.1.6 Suitable general programs may be employed in direct calculations. Where a not generally used program is to be employed, supporting information is also to be submitted to substantiate the validity of the computer program.
1.5.1.7 The service coefficient f_r =1.
1.5.1.8 The following documentation is to be submitted:
(1) list of drawings used;
(2) description of FE calculation progeams used;
(3) detailed description of structrual FE model;
(4) description of physical properties and material properties of structrual model;
(5) detailed description of boundary conditions;
(6) detailed description of loading conditions;
(7) details of applied loads;
(8) figures of the overall and local deformations;
(9) results of yield strength evaluation;
(10) results of buckling strength evaluation;
(11) output showing whether the structure meet design criteria or not.
1.5.1.9 Definitions
(1) A right-handed coordinate system is to be used, see Figure 1.5.1.9, with:
① the X-axis measured in the longitudinal direction, positive forward;
② the Y-axis measured in the transverse direction, positive to port from the centerline;
③ the Z-axis measured in the vertical direction, positive upwards.

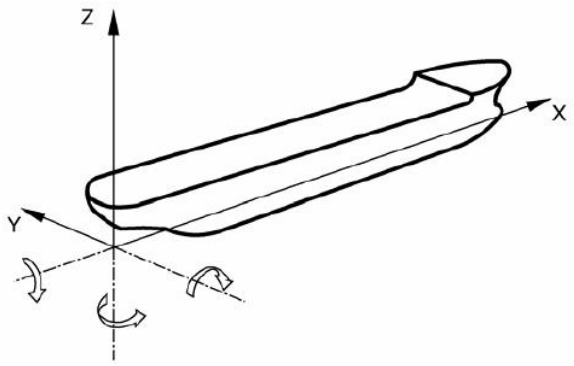

Figure 1.5.1.9 Coordinate system

(2) The von Mises stress σ_e is to be determined by the following formula:

$$\sigma_e = \sqrt{\sigma_x^2 + \sigma_y^2 - \sigma_x\sigma_y + 3\tau_{xy}^2}$$

where: σ_x — stress of element in direction x, in N/mm^2;
σ_y — stress of element in direction y, in N/mm^2;
τ_{xy} — shear stress of element in plane xy, in N/mm^2.
(3) The shear stress τ, in N/mm^2; for the primary structural members along the depth direction, the average shear stress of plate element may be calculated as follows:

$$\tau = \frac{\sum_{i=1}^{n}(\tau_i A_i)}{A_w} \quad \text{N/mm}^2$$

where: A_i — the effective shear area of element i, in mm^2;
τ_i — the shear stress of element i, in N/mm^2;
A_w — the total effective shear area of actual structure, in mm^2.

1.5.2 Motions and accelerations

1.5.2.1 Ship's absolute motions and accelerations

(1) The roll period T_R of the ship is to be calculated as follows:

$$T_R = 2\frac{k_r}{\sqrt{GM}} \qquad \text{s}$$

where: k_r — roll radius of gyration, in m, to be assumed as follows if no specific values available:

$k_r = 0.35B$ ballast condition for oil tankers;

$k_r = 0.25B$ ore carriers;

$k_r = 0.39B$ others;

where: B — breadth of ship, in m;

GM — initial metacentric height in the condition considered, to be assumed as follows if no specific values available:

$GM = 0.12B$ for tankers and bulk carriers;

$= 0.07B$ for others.

(2) The maximum roll angle φ_m is to be calculated as follows, but need not be greater than 0.523 rad:

$$\varphi_m = f_r k \frac{62.5 - 1.25T_R}{B + 75} \qquad \text{rad}$$

where: T_R — calculated as (1);

B — breadth of ship, in m;

f_r — service coefficient, see 1.5.1.7 of this Section;

k — coefficient, to be taken as follows:

$k = 1.2$ for ships without bilge keel;

$k = 1.0$ for ships with bilge keel;

$k = 0.8$ for ships with activated stabilizers.

(3) Pitch period T_P is to be calculated as follows:

$$T_P = 1.80\sqrt{\frac{L}{10}} \qquad \text{s}$$

where: L — length of ship, in m.

(4) The maximum pitch angle ψ_m is to be calculated as follows, but need not be greater than 0.14 rad:

$$\psi_m = 0.25\frac{a_0}{C_b} \qquad \text{rad}$$

where: C_b — block coefficient;

a_0 — acceleration factor, to be calculated as follows:

$$a_0 = f_\gamma \left(3\frac{C}{L} + C_V \frac{V}{\sqrt{L}} \right)$$

where: f_r — service coefficient, see 1.5.1.7 of this Section;

$C_V = \frac{\sqrt{L}}{50}$, not to be greater than 0.2;

V — maximum service speed, in kn;

C — coefficient, see 2.2.3.1 of Section 2, Chapter 2 of this PART;

L — length of ship, in m.

1.5.2.2 Ship's relative motions and accelerations

(1) Surging acceleration a_x is to be calculated as follows:

$$a_x = 2a_0\sqrt{C_b} \qquad \text{m/s}^2$$

where: C_b — block coefficient;

a_0 — see 1.5.2.1(4) of this Section.

(2) Sway acceleration a_y is to be calculated as follows:

$$a_y = 3a_0 \qquad \text{m/s}^2$$

where: a_0 — see 1.5.2.1(4) of this Section.

(3) Heave acceleration a_z is to be calculated as follows:

$$a_z = 7\frac{a_0}{\sqrt{C_b}} \qquad \text{m/s}^2$$

where: C_b — block coefficient;

a_0 — see 1.5.2.1(4) of this Section.

(4) Roll acceleration a_r is to be calculated as follows:

$$a_r = \varphi_m \left(\frac{6.28}{T_R} \right)^2 \qquad \text{rad/s}^2$$

where: T_R — roll period, in sec., to be calculated according to 1.5.2.1(1) of this Section;

φ_m — maximum roll angle, in rad, to be calculated according to 1.5.2.1(2) of this Section.

(5) Pitch acceleration a_p is to be calculated as follows:

$$a_p = \psi_m \left(\frac{6.28}{T_p} \right)^2 \qquad \text{rad/s}^2$$

where: T_P — pitch period, in sec., to be calculated according to 1.5.2.1(3) of this Section;

ψ_m — maximum pitch angle, in rad, to be calculated according to 1.5.2.1(4) of this Section.

(6) Transverse combined acceleration a_t is to be calculated as follows:

$$a_t = \sqrt{a_y^2 + \left[a_r \left(z - z_{rp} \right) + 10 \sin \varphi_m \right]^2} \qquad \text{m/s}^2$$

where: a_y — sway acceleration, see 1.5.2.2(2);

a_r — roll acceleration, see 1.5.2.2(4);

φ_m — maximum roll angle, see 1.5.2.1(2) of this Section;

z — vertical distance from the point considered to baseline;

z_{rp} — vertical distance from axis of gyration for roll and that for pitch to baseline, to be taken from the values obtained by the following two formulae, whichever is the lesser;

$$z_{rp1} = \frac{D}{4} + \frac{d_1}{2} \qquad \text{m}$$

$$z_{rp2} = \frac{D}{2} \qquad \text{m}$$

where:

D — moulded depth, in m;

d_1 — draught the condition considered, in m.

(7) Longitudinal combined acceleration a_l is to be obtained by the following formula:

$$a_l = \sqrt{a_x^2 + \left[a_p \left(z - z_{rp} \right) + 10 \sin \psi_m \right]^2} \qquad \text{m/s}^2$$

where: z_{rp}, z — see 1.5.2.2 (6);

a_x — surge acceleration, see 1.5.2.2 (1);

a_p — pitch acceleration, see 1.5.2.2 (5);

ψ_m — maximum roll angle, in rad, calculated according to 1.5.2.1 (4) of this Section.

(8) Vertical combined acceleration a_v is to be taken from the values obtained by the following two formulae, whichever is greater:

$$a_{v1} = \sqrt{a_z^2 + a_r^2 y^2} \qquad \text{m/s}^2$$

$$a_{v2} = \sqrt{a_z^2 + a_p^2 \left(x - 0.45L \right)^2} \qquad \text{m/s}^2$$

where: a_z — heave acceleration, see 1.5.2.2 (3);

a_r — roll acceleration, see 1.5.2.2(4);

a_p — pitch acceleration, see 1.5.2.2(5);

x — longitudinal distance from the point considered to AP, in m;

y — transverse distance from the point considered to longitudinal centerline, in m;

L — length of ship, in m.

1.5.3 External sea pressure

1.5.3.1 The external sea pressure consists of hydrostatic pressure and hydrodynamic wave pressure.

1.5.3.2 The hydrostatic pressure P_{hs} is to be calculated as follows:

$p_{hs} = \rho_w g \left(d_1 - z \right)$ kN/m^2 for the considered load point below the waterline;

$= 0$ kN/m^2 for the considered load point above the waterline.

where: ρ_w — density of sea water, taken as 1.025 t/m^3;

d_1 — draught in the considered condition, in m;

z — vertical distance measured from the considered point to the baseline, in m.

1.5.3.3 Hydrodynamic wave pressure

(1) The hydrodynamic wave pressure p_{WL} at the side waterline of the ship is to be calculated by the following formula:

$$p_{WL} = f_r\left(2B^{0.66} + 3CC_b + 0.4d_1\right) \quad \text{kN/m}^2$$

where: f_r — service coefficient, see 1.5.1.7 of this Section;

B — breadth of ship, in m;

C_b — block coefficient;

d_1 — draught under the loading condition for calculation, in m;

C — coefficient, see 2.2.3.1 of Section 2, Chapter 2 of this PART.

(2) The hydrodynamic wave pressure p_{BS} at the bilge of the ship is to be calculated by the following formula:

$$p_{BS} = p_{WL} - 1.2d_1 \quad \text{kN/m}^2$$

where: p_{WL}, d_1 — see 1.5.3.3(1).

(3) The hydrodynamic wave pressure p_{BC} at the bottom centerline is to be calculated by the following formula:

$$p_{BC} = 0.5\left(p_{WL} - 1.2d_1\right) \quad \text{kN/m}^2$$

where: p_{WL}, d_1 — see 1.5.3.3(1).

(4) The hydrodynamic wave pressure p_{hd} (see Figure 1.5.3.3) at any point below the waterline is to be calculated by the following formula:

$$p_{hd} = p_{WL} + \left(p_{BS} - p_{WL}\right)\left(1 - \frac{z}{d_1}\right) + \left(p_{BC} - p_{BS}\right)\left(1 - \frac{2y}{B}\right) \quad \text{kN/m}^2$$

where: p_{WL} — calculated according to 1.5.3.3 (1);

p_{BS} — calculated according to 1.5.3.3 (2);

p_{BC} — calculated according to 1.5.3.3 (3);

B — breadth of ship, in m;

d_1 — draught in the considered condition, in m;

y — transverse distance measured from the considered point to the centreline, in m;

z — vertical distance measured from the considered point to the baseline, in m.

(5) The hydrodynamic wave pressure p_{hd} (see Figure 1.5.3.3) at any point at side shell plating above the waterline is to be calculated by the following formulae:

$$p_{hd} = p_{WL} - 10\left(z - d_1\right) \quad \text{kN/m}^2 \quad \text{for } d_1 < z \le d_1 + \frac{p_{WL}}{10}$$

$$p_{hd} = 0 \quad \text{kN/m}^2 \quad \text{for } d_1 + \frac{p_{WL}}{10} < z$$

where: p_{WL} — calculated according to 1.5.3.3 (1);

d_1 — draught under the considered condition, in m;

z — vertical distance measured from the considered point to the baseline, in m.

(6) The green sea load p_{wdk} (see Figure 1.5.3.3) on weather deck is to be calculated by the following formula, but not less than zero:

$$p_{wdk} = p_{WL} - 10\left(z_{dk} - d_1\right) \quad \text{kN/m}^2$$

where: p_{WL} — calculated according to 1.5.3.3(1);

d_1 — draught under the considered condition, in m;

z_{dk} — vertical distance measured from the weather deck to the baseline, in m.

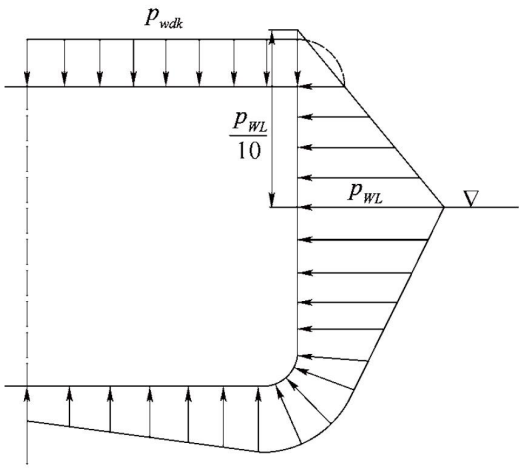

Figure 1.5.3.3 External Hydrodynamic Wave Pressure

1.5.4 Dry bulk cargo pressure

1.5.4.1 The pressure caused by dry bulk cargo is to be calculated according to 1.5.4.2 and 1.5.4.3.

1.5.4.2 The top surface of dry bulk cargo is to be determined according to the following requirements:

(1) For a prismatic cargo hold where the dry bulk cargo is loaded to the top of the hatch coaming, the top surface of cargo is to be determined equivalently according to the same cargo volume within the cargo hold. The equivalent cargo horizontal surface at h_C above the inner bottom, as shown in Figure 1.5.4.2(1), is to be calculated by the following formula:

$$h_C = h_{HPU} + h_0 \quad \text{m}$$

where:

h_{HPU} — vertical distance from inner bottom to the lower point of intersection of topside tank with side shell plating or inner hull plating, in m, see Figure 1.5.4.2(1);

h_0 — vertical distance from the lower point of intersection of topside tank with side shell plating or inner hull to equivalent cargo horizontal surface, $h_0 = \frac{S_A}{B_H}$, in m;

where:

$S_A = S_0 + \frac{V_{HC}}{l_H}$

S_0 —shadow area from the lower point of intersection of topside tank with side shell plating or inner hull plating to horizontal surface of upper deck, in m^2, see Figure 1.5.4.2(1);

V_{HC} — volume enclosed by hatch coaming from deck to coaming top, in m^3;

l_H — length of cargo hold, in m;

B_H — average breadth of cargo hold, in m.

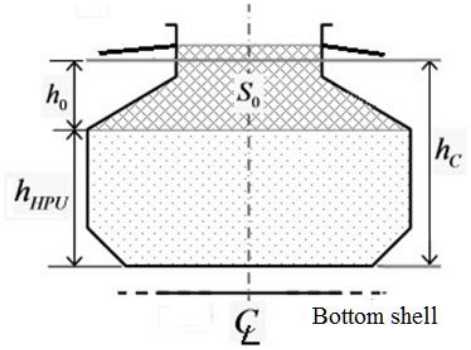

Figure 1.5.4.2(1) Definitions of h_c, h_0, h_{HPU} and S_0

(2) For a prismatic cargo hold where the dry bulk cargo is not loaded to upper deck, it is assumed that its top surface is parabolic across along the hull and the shape of each cross section along the length of the cargo hold is the same, as shown in Figure 1.5.4.2(2). Parameters of the top surface shape are to be determined according to cargo volume in the cargo hold (taken as M/ρ_C) and calculated as follows:

$h_C = h_y + h_2 + h_{HPL}$ in m, when $h_2 \geq 0$

$h_C = h_y + h_{22}$ in m, when $|y| \leq \frac{B_2}{2}$ and $h_2 < 0$

$h_C = 0$ in m, when $|y| > \frac{B_2}{2}$ and $h_2 < 0$

where:

h_2 — distance, in m, see Figure 1.5.4.2(2), to be calculated by the following formula:

$$h_2 = \frac{M}{\rho_C B_H l_H} - \frac{B_H + B_{IB}}{2B_H} h_{HPL} - \frac{B_H}{6} \tan\delta + \frac{V_{TS}}{B_H l_H}$$

h_y — distance, in m, see Figure 1.5.4.2(2), to be calculated by the following formula:

$$h_y = h_1 (1 - \frac{4y^2}{B_H^2}) \quad \text{if } h_2 \geq 0$$

$$h_y = h_1 (1 - \frac{4y^2}{B_2^2}) \quad \text{if } h_2 < 0$$

B_2 — cargo surface breadth if $h_2 < 0$, in m, see Figure 1.5.4.2(2), to be calculated by the following formula:

$$B_2 = \sqrt{\frac{\frac{6}{l_H}(\frac{M}{\rho_C} + V_{TS}) + \frac{3B_{IB}^2}{B_H - B_{IB}} h_{HPL}}{\tan\delta + \frac{3h_{HPL}}{B_H - B_{IB}}}}$$

h_{22} — distance if $h_2 < 0$, in m, see Figure 1.5.4.2(2), to be calculated by the following formula:

$$h_{22} = h_{HPL} (\frac{B_2 - B_{IB}}{B_H - B_{IB}})$$

h_{HPL} — vertical distance from inner bottom to the upper point of intersection of hopper side tank with side shell plating or inner hull, in m, see Figure 1.5.4.2(2). If there is no hopper side tank, h_{HPL} is taken as 0.

h_1 — distance, in m, see Figure 1.5.4.2(2), to be calculated by the following formula:

$$h_1 = \frac{B_H}{4} \tan\delta \quad \text{if } h_2 \geq 0$$

$$h_1 = \frac{B_2}{4} \tan\delta \quad \text{if } h_2 < 0$$

M — mass of dry bulk cargo in cargo hold, in t;

V_{TS} — total volume of lower stool of transverse bulkhead within cargo hold length l_H, in m^3. This does not include the portion of hopper side tank that passes through transverse bulkhead;

B_H, l_H — see (1) of this paragraph;

B_{IB} — average breadth of inner bottom, in m, see Figure 1.5.4.2 (2);

ρ_C — density of dry bulk cargo, in t/m^3;

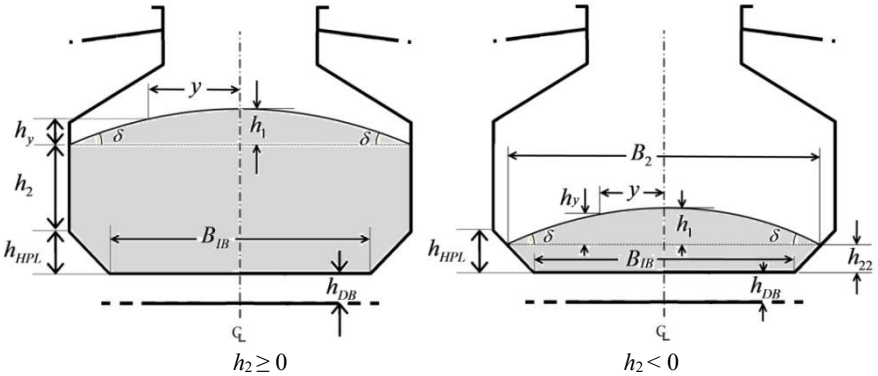
δ — angle of repose of cargo, determined as follows:

$\delta = 35°$ for ore and coal;

$\delta = 30°$ for salt, yellow sand, stone, grain, etc.;

$\delta = 25°$ for bulk cement;

y — transverse distance from considered point to the longitudinal centerline section, in m.



$h_2 \geq 0$ $h_2 < 0$

Figure 1.5.4.2(2) Definitions of h_y, h_1, h_2, h_{22} and h_{HPL}

(3) For a non-prismatic cargo hold, the top surface of dry bulk cargo may be taken at the horizontal surface of upper deck, and density taken as M/V_H, where V_H is cargo hold volume, not including its portion enclosed by hatch coaming.

1.5.4.3 The total pressure p_C caused by dry bulk cargo is to be calculated by the following formula and taken not less than zero:

$$p_C = \rho_C K_C (g + 0.5a_v)(h_C + h_{DB} - z) \quad \text{kN/m}^2$$

where:

ρ_C — density of dry bulk cargo, in t/m^3;

a_v — vertical acceleration in way of considered centroid of cargo hold, in m/s^2, see 1.5.2.2 (8) of this Section;

h_C — vertical distance from the inner bottom to the top surface of dry bulk cargo, in m, determined according to 1.5.4.2 of this Section;

h_{DB} — height of double bottom, in m;

z — vertical height of the considered point, measured from baseline, in m;

K_C — coefficient, to be calculated as follows:

$K_C = \cos^2\alpha + \tan^2(45^\circ - 0.5\delta)\sin^2\alpha$, for inner bottom, hopper side tank, transverse bulkhead and longitudinal bulkhead, lower stool, vertical upper stool, inner hull and side plate;

$K_C = 0$, for top side tank, upper deck and inclined upper stool;

α — included angle between considered plate and horizontal plane, in deg;

δ — angle of repose of cargo, in deg, see 1.5.4.2(2) of this Section.

1.5.5 Liquid pressure in tank

1.5.5.1 The lateral pressure p_l caused by liquid in tank is to be calculated by the following formula:

$$p_l = \rho g(h + 2.5f_r) \quad \text{kN/m}^2$$

where:

ρ — mass density of liquid, in t/m^3, to be taken not less than 1.025 t/m^3;

h — vertical distance from the considered point to top of tank, or half the vertical distance to the top of the overflow, whichever is the greater, in m;

f_r — service coefficient, see 1.5.1.7 of this Section.

1.5.6 Direct strength calculation for cargo holds

1.5.6.1 The design load is to be in compliance with the following requirements:

(1) In general, the global load and local loads are to be taken into account, including vertical bending moment, external sea pressure, cargo loading, liquid pressure in tank, etc.

(2) The wave bending moment M_w is to be calculated as in 2.2.3 of Section 2, Chapter 2 of this PART, and $f_r M_w$ is to be taken according to the service coefficient in 1.5.1.7 of this Section.

1.5.6.2 The extent of model is to be in compliance with the following requirements:

(1) Normally, the longitudinal extent is to cover the length of 1/2 hold + 1 hold + 1/2 hold within the cargo area amidships.

(2) In general, when both primary members and design loads are symmetrical to the longitudinal centerline section, only half breadth, starboard or port side is to be modeled. When the hold structure or load is not symmetrical to the longitudinal centerline section, a full-breadth model is to be required.

(3) The vertical extent is to be taken as all members within the main hull, including all the primary members on the main deck.

1.5.6.3 The element is to be selected in compliance with the following principles:

(1) In general, inner and external shell plates, deep webs of transverse rings, girders, floors, plane bulkhead web stiffeners, frames and other members as well as corrugated bulkheads and bulkhead stools are to be simulated by plate elements. In high stress areas and areas of significant stress gradient, such as lightening holes, manholes, connection of stool to bulkhead, positions adjacent to brackets or structural discontinuities, triangular elements are to be avoided as practicable as possible.

(2) Stiffeners of plates, which are subject to external sea pressure or cargo pressure, are simulated by beam elements, taking eccentric effects into consideration. The face plates and stiffeners of primary members (e.g. girders, floor stiffeners, frames and brackets may be simulated by rod elements.

1.5.6.4 The meshing of elements is to be in compliance with the following principles:

(1) Meshes are divided for each spacing of longitudinals or similar spacing in transverse and vertical direction of hull and for each spacing of frames or similar spacing in longitudinal direction of hull, and so are side meshes divided. Meshes are to be shaped square as far as practicable.

(2) Not less than three plate elements are to be arranged in vertical direction for bottom girders and floors. Not less than two plate elements are to be arranged in vertical direction for ring structures of hopper tanks and top wing tanks.
(3) In general, each flange plate or web plate of a corrugated bulkhead is to be taken at least as a plate element; for the plate elements at the lower end of the corrugated bulkhead in the vicinity of lower stool and for the elements adjacent to stool plate, the aspect ratio is to be close to 1.
(4) Normally, the aspect ratio of plate elements is not to exceed 3, and the aspect ratio of plate elements for corrugated bulkhead is not to exceed 2. Triangular plate elements are to be minimized in modeling as far as possible; the aspect ratio of plate elements is to be close to 1 as far as possible within the high stress area or area of high stress gradient and triangular plate elements are to be avoided.
1.5.6.5 Strength evaluation is to be carried out for all primary members in the cargo holds amidships (including bulkheads) within the longitudinal extent.
1.5.6.6 When the stress distribution or stiffness of members is affected by the openings on primary members, the following methods may be adopted:
(1) For openings, e.g. lightening holes, manholes, of web plates of primary structural members, simulation is to be carried out according to Table 1.5.6.6 of this Section.

Simulation of Openings of Web Plates of Primary Structural Members Table 1.5.6.6

$h_0/h < 0.35$ and $g_0 < 1.2$	Modeling not needed for openings
$0.35 \le h_0/h < 0.5$ and $g_0 < 1.2$	Equivalent plate thickness being $t_1 = \frac{h-h_0}{h} t_w$
$h_0/h < 0.5$ and $1.2 \le g_0 < 2$	Equivalent plate thickness being $t_2 = \frac{h-h_0}{hg_0} t_w$
$h_0/h \ge 0.5$ or $g_0 \ge 2$	Modeling based on geometry of openings or by means of removing the appropriate elements in way of openings

where: t_w — thickness of web plates;
l_0 — opening length perpendicular to height of web plates, see Figure 1.5.6.6(1); where the space d_0 of continuous openings is less than 0.25 h, $l0$ is to be taken as the length across the openings, see Figure 1.5.6.6(2);
h_0 — opening height parallel to height of web plates, see Figure 1.5.6.6(1);
h — height of web plates in way of openings, see Figure 1.5.6.6(1);

$$g_0 = 1 + \frac{l_0^2}{2.6(h-h_0)^2}.$$

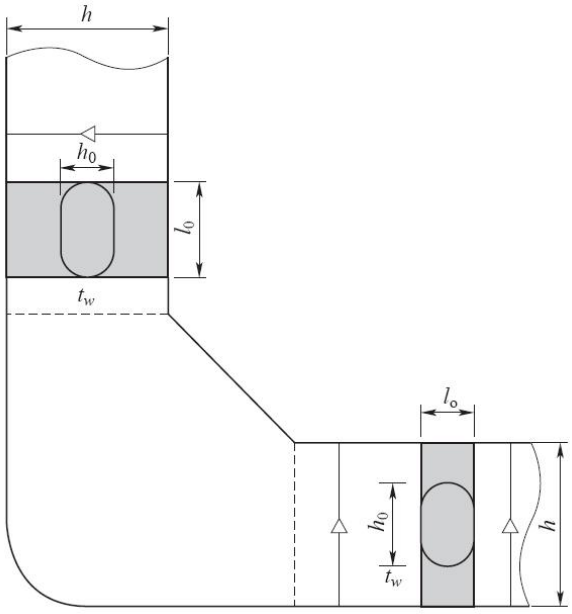


Figure 1.5.6.6(1) Openings of Web Plates

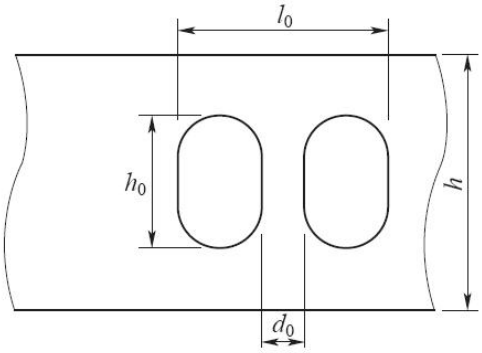

Figure 1.5.6.6(2) Length l_0 for Space of Continuous Openings $d_0 < 0.25\ h$

(2) For detailed stress analysis, the mesh size of the innermost two cycles of elements around the opening is not to be greater than 50 mm × 50 mm. The meshing is to be such that the transition from refined to coarse meshes is smooth. Stiffeners welded directly to the edges of the opening are to be simulated by plate elements; web stiffeners located more than 50 mm away from the edges of the opening can be simulated by rod or beam elements, as indicated in Figure 1.5.6.6(3). The allowable stress is to be as follows:

$$[\sigma_e] = 1.6 \times 235 / K \quad \text{N/mm}^2$$

where: K — material factor.

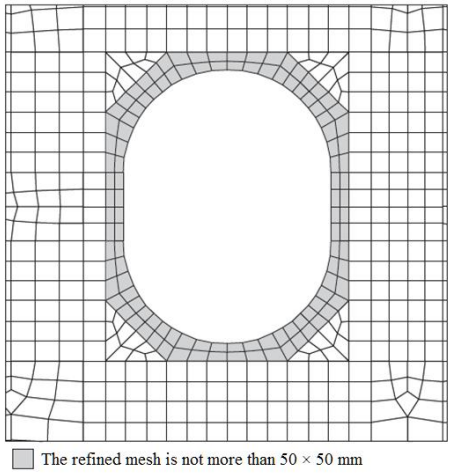

Figure 1.5.6.6(3) Refined Opening of Web Plate

1.5.7 Direct calculation of global strength of the ship

1.5.7.1 The flowchart of direct calculation of global strength of the ship is shown in Figure 1.5.7.1.

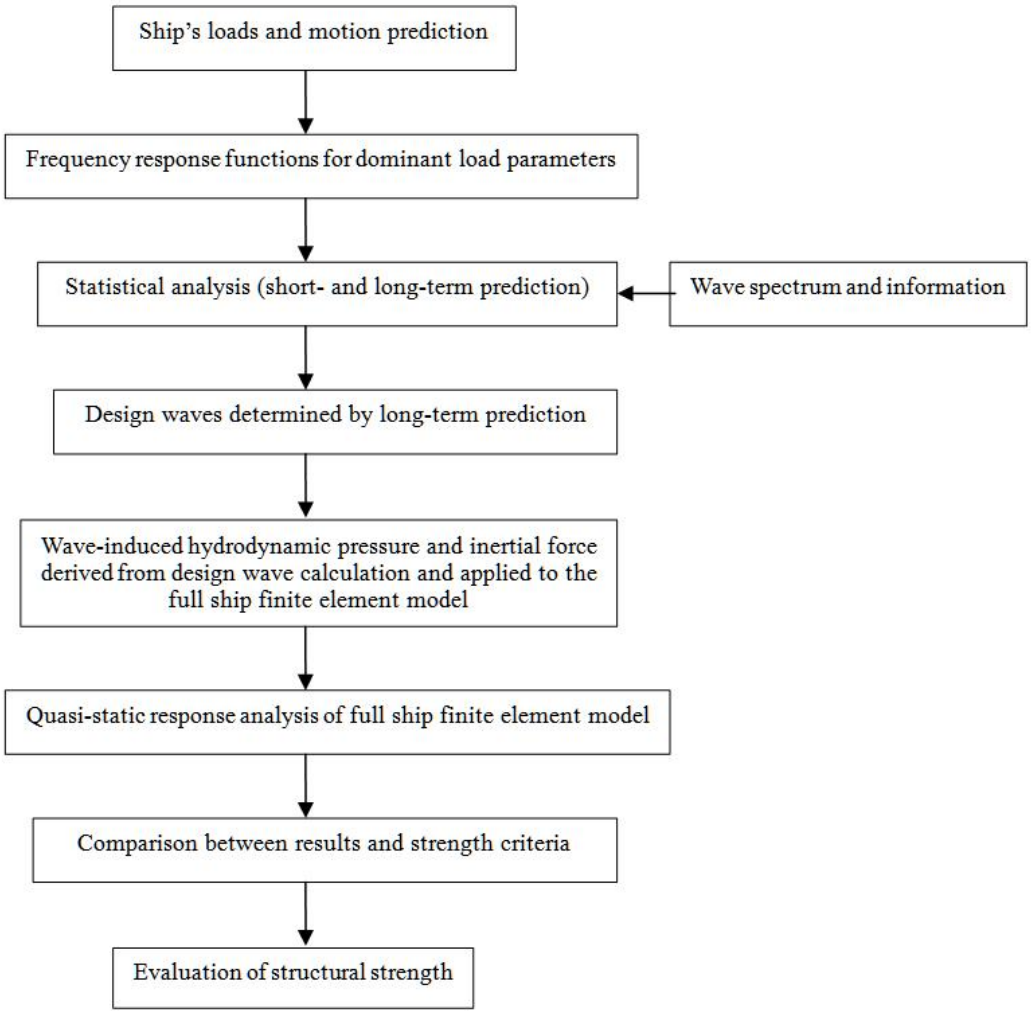

Figure 1.5.7.1 Flowchart of Direct Calculation of Global Strength of the Ship

1.5.7.2 The wave loads are to be determined by the equivalent design wave method, and in compliance with the following requirements:

(1) Ship motion and wave load are to be calculated based on the two-dimensional linear strip theory, the three-dimensional linear theory (considering non-linear corrections) or the non-linear wave theory.

(2) To calculate the ship motions and loads under design waves for each loading condition, the input data are considered as follows:

① the number of wave frequency (or wave length) is not to be less than 20, range of wave frequency taken as 0.2 to 3 according to the ratio of wave length to ship's length (λ / L), and the increments taken as 0.1;

② not less than 7 wave heading angles are to be taken, including 0º (head sea), 30º, 60º, 90º, 120º, 150º, 180º (following sea);

③ ship speed is taken as 0.

1.5.7.3 Statistical analysis is to be carried out according to the following requirements:

(1) *P-M* wave spectrum is used for calculation of ship's motion on irregular waves, wave load response and its short- and long-term prediction:

$$S(\omega, H_{1/3}, T_2, \theta) = \begin{cases} \dfrac{2}{\pi} 124 H_{1/3}^2 T_2^{-4} \omega^{-5} \exp\left(-\dfrac{496}{T_2^4 \omega^4}\right) \cos^2 \theta, & |\theta| \le \dfrac{\pi}{2} \\ 0, & \theta \text{ as other values} \end{cases}$$

where: ω — circular frequency of waves, in rad/s;

$H_{1/3}$ — significant wave height, in m;

T_2 — zero-crossing wave period, in sec.;

$\frac{2}{\pi}\cos^2\theta$ — energy spread function;

θ — included angle between complex wave and main sea direction, in rad.

(2) In the wave scatter diagram used in the calculations, the worst wave data of the ship navigating in service areas are used.

1.5.7.4 The design waves are to be calculated as follows:

(1) The design wave parameters are defined as shown in Figure 1.5.7.4(1):

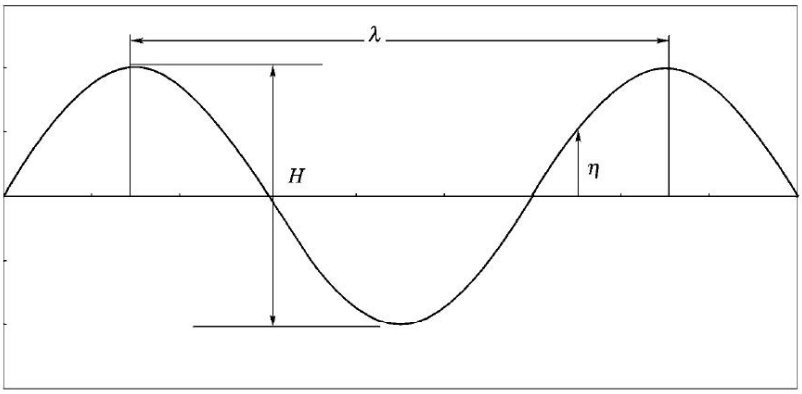

Figure 1.5.7.4(1) Design Wave Parameters

where:

λ — wave length, minimum distance between two adjacent wave crests, in m;

H — wave height, minimum distance from wave crest to wave trough, in m;

η — wave surface, as sine equation.

(2) The probability level of long-term prediction values is to be selected according to the dominant load parameters.

(3) To calculate the curve of frequency response functions of dominant load parameters under different heading angles of regular waves, as shown in Figure 1.5.7.4(2).

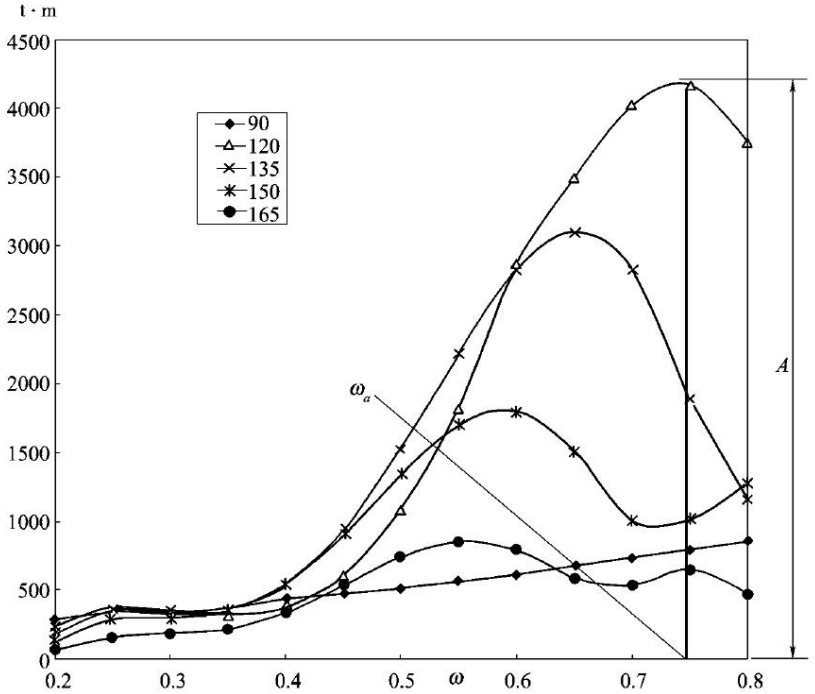

Figure 1.5.7.4(2) Frequency Response Functions

(4) The wave frequency ω_a where dominant load parameters are at the maximum amplitude are determined according to frequency response functions.

(5) Design wave length λ is to be calculated as follows:

$$\lambda = (2\pi g)/\omega_a^2 \quad \text{m}$$

where:

g — gravitational acceleration;

ω_a — wave frequency corresponding to dominant load parameters exceeding the maximum amplitude, to be determined by 1.5.7.4(4), in rad/s.

(6) Amplitude of design waves is to be calculated as follows:

$$a_w = \frac{L_j}{A_j}$$

where: a_w — amplitude of design waves;

A_j — maximum amplitude of dominant load parameters;

L_j — long-term extreme value of dominant load parameter at the probability level according to 1.5.7.4(2);

j — dominant load parameter number.

(7) The time t_j instant where the dominant load parameter reaches maximum is to be determined as follows:

$$t_j = (n\pi + \pi/2 - \varepsilon_j)/\omega_a$$

where: ω_a — wave frequency corresponding to dominant load parameters exceeding the maximum amplitude, to be determined by 1.5.7.4(4), in rad/s;

ε_j — phase angle corresponding to dominant load parameters exceeding the maximum amplitude, in rad;

j — as in 1.5.7.4(6);

n — 0 or 1.

(8) Wave pressure and other load components under design waves are to be calculated as follows:

$$P_i = A_i a_w \sin(\omega_a t_j + \varepsilon_i)$$

where: P_i — wave pressure or other load components at arbitrarily considered position of hull;

A_i — amplitude of frequency response function of wave pressure or other load component P_i;

ε_i — phase corresponding to wave pressure or other load component P_i;

t_j — time instant where dominant load parameter reaches maximum, determined according to 1.5.7.4(7).

1.5.7.5 Load components and applying

(1) The ship's light weight: the masses of steel materials, outfits and small equipment are to be simulated by regulating the material density of each component. Large equipment and ballast water are to be simulated by mass elements, which may be established on the corresponding structures, and also may be connected to the actual structures through the simulated structures.

(2) The weight of cargo in hold and on deck is to be simulated by appropriate mass elements.

(3) External hydrostatic pressure, which acts, according to draft under the considered condition, on external wet surface of hull.

(4) Wave pressure is to be calculated according to the equivalent design wave method, acting on external wet surface of hull.

(5) Inertial load is to be based on the initial acceleration obtained by the equivalent design wave method, acting on the whole model.

1.5.7.6 The mass model of whole ship is to be matched with ship's hydrostatic buoyancy. The error between the total weight and total buoyancy is not to be more than 0.0001Δ, where Δ is the moulded displacement, in t, at the corresponding draught; the error of longitudinal coordinate for centers of mass and buoyancy is not to be more than $0.0025L$, where L is the length of ship, in m; the error of horizontal coordinate is not to be more than $0.001B$, where B is the breadth of ship, in m.

1.5.8 Yield strength evaluation

1.5.8.1 The stress of members is not to exceed the relevant allowable stress criteria.

1.5.8.2 Membrane stress, i.e. median stress at center of bending plate element is to be taken for plate element.

1.5.8.3 For corrugated bulkheads, the stress in way of corrugation end may be obtained by extrapolation of average stresses of bulkhead plating.

1.5.8.4 For those elements of concentrated stress and poor shape, the stresses are not to be taken into consideration.

1.5.9 Buckling strength evaluation

1.5.9.1 The buckling safety factor λ of plate panel is not to be less than the related minimum one.

1.5.9.2 The buckling strength evaluation of plate panel is to be carried out for all primary members. During the evaluation, the appropriate standard thickness deduction is to be taken into consideration for the critical buckling compressive stresses.

1.5.9.3 The biaxial compressive stress and shear stress are to be taken into account for the buckling strength evaluation and membrane stress of plate panel is to be used for the buckling strength evaluation.

1.5.9.4 Critical buckling stress and plastic correction

(1) The elastic critical buckling stress σ_{xcr_e} of the plate panel, of which the shorter side is subjected to compression and bending, is defined as follows:

$$\sigma_{xcr_e} = k_x C_1 \frac{\pi^2 E}{12(1-\nu^2)}\left(\frac{t}{s}\right)^2 \qquad \text{N/mm}^2$$

where: k_x — buckling coefficient for shorter side subjected to compression and bending, to be calculated according to Table 1.5.9.4(1);

C_1 — boundary constraint coefficient, see Table 1.5.9.4(2);

t — thickness of plate panel, in mm;

s — length of shorter side of plate panel, in mm, taken as spacing of stiffeners;

E — material's elastic modulus, in N/mm^2;

v — Poisson's ratio, $v = 0.3$ for steel;

x — axial direction of longer side of plate panel.

Buckling Coefficient of Plate Panel **Table 1.5.9.4(1)**

Buckling load condition		Buckling coefficient
Shorter side subject to stress	 where: $0 \le \varphi \le 1$	$k_x = \frac{8.4}{\varphi + 1.1}$
	 where: $-1 \le \varphi < 0$	$k_x = 7.6 - 6.4\varphi + 10\varphi^2$
Longer side subject to stress	 where: $0 \le \varphi \le 1$	$k_y = \left[1 + \left(\frac{s}{l}\right)^2\right]^2 \frac{2.1}{\varphi + 1.1}$
	 where: $-1 \le \varphi < 0$	$k_y = 1.909(1+\varphi)\left[1 + \left(\frac{s}{l}\right)^2\right]^2 - k_p\varphi + 10\varphi(1+\varphi)\left(\frac{s}{l}\right)^2$ where: $k_p = \begin{cases} 24\left(\frac{s}{l}\right)^2 & \frac{l}{s} \le \frac{3}{2} \\ 2 + 16\left(\frac{s}{l}\right)^2 + 8\left(\frac{s}{l}\right)^4 & \frac{l}{s} > \frac{3}{2} \end{cases}$
Edges subject to shear stress		$k_t = 5.34 + 4\left(\frac{s}{l}\right)^2$

Plate Panel Boundary Restraint Coefficients C_1 and C_2 **Table 1.5.9.4(2)**

Boundary	C_1	C_2	
		In double bottom or between double sides	Elsewhere
Angles or T-stiffeners	1.1	1.3	1.2
Flat bars or bulb flats	1.0	1.2	1.1

(2) The elastic critical buckling stress σ_{ycr_e} of the plate panel, of which the longer side is subjected to compression and bending, is defined as follows:

$$\sigma_{ycr_e} = k_y C_2 \frac{\pi^2 E}{12(1-\nu^2)}\left(\frac{t}{s}\right)^2 \qquad \text{N/mm}^2$$

where: k_y — buckling coefficient for longer side subjected to compression and bending, to be calculated according to Table 1.5.9.4(1);

C_2 — boundary restraint coefficient, see Table 1.5.9.4(2);

y — axial direction of shorter side of plate panel;

other symbols are the same as in 1.5.9.4(1).

(3) The elastic critical buckling stress τ_{cr_e} of plate panel subject to shear force is defined as follows:

$$\tau_{cr_e} = k_t C_1 \frac{\pi^2 E}{12(1-\nu^2)}\left(\frac{t}{s}\right)^2 \qquad \text{N/mm}^2$$

where: k_t — shear buckling coefficient, to be calculated according to Table 1.5.9.4(1);

other symbols are the same as in 1.5.9.4(1) and (2).

1.5.9.5 The elastic critical buckling stress of plate panel is to be corrected as follows:

$$\sigma_{\substack{xcr \\ (ycr)}} = \begin{cases} \sigma_{\substack{xcr_e \\ (ycr_e)}} & \text{when } \sigma_{\substack{xcr_e \\ (ycr_e)}} \le \dfrac{R_{eH}}{2} \\ R_{eH}\left(1 - \dfrac{R_{eH}}{4\sigma_{\substack{xcr_e \\ (ycr_e)}}}\right) & \text{when } \sigma_{\substack{xcr_e \\ (ycr_e)}} > \dfrac{R_{eH}}{2} \end{cases}$$

$$\tau_{cr} = \begin{cases} \tau_{cr_e} & \text{when } \tau_{cr_e} \le \dfrac{\tau_s}{2} \\ \tau_s\left(1 - \dfrac{\tau_s}{4\tau_{cr_e}}\right) & \text{when } \tau_{cr_e} > \dfrac{\tau_s}{2} \end{cases}$$

where:

$\sigma_{xcr_e}, \sigma_{ycr_e}, \tau_{cr_e}$ — respectively as elastic critical buckling compressive stress along axes x and y under uniaxial stress and critical buckling shear stress of plate panel, see 1.5.9.4 of this Section;

R_{eH} — yield stress of material, in N/mm^2;

$\tau_s = \dfrac{R_{eH}}{\sqrt{3}}$.

1.5.9.6 In the buckling strength evaluation, the buckling safety factor λ is to be the ratio of the critical buckling stress of plate panel to actual compressive stress, see Table 1.5.9.6. The σ_x, σ_y, τ_{xy} are considered in their absolute values in calculation. Where the working stress along axes x and y is of tension stress, such stress component is to be taken as zero.

Calculation of λ **Table 1.5.9.6**

Stress condition \ Aspect ratio of plate panel	$1 \le \frac{l}{s} \le \sqrt{2}$	$\sqrt{2} < \frac{l}{s} \le 8$
Biaxial compression	$\dfrac{1}{(1+k_1)}\dfrac{\sigma_{xcr}}{\sigma_x}$	$\dfrac{1}{\sqrt{(1+k_1^2)}}\dfrac{\sigma_{xcr}}{\sigma_x}$
Compression along x axis + edge shear	$\dfrac{1}{\sqrt{(1+k_2^2)}}\dfrac{\sigma_{xcr}}{\sigma_x}$	
Compression along y axis + edge shear	$\dfrac{1}{\sqrt{(1+k_3^2)}}\dfrac{\sigma_{ycr}}{\sigma_y}$	
Biaxial compression + edge shear	$\dfrac{1}{\sqrt{(1+k_1^2+k_2^2)}}\dfrac{\sigma_{xcr}}{\sigma_x}$	

where: $k_1 = \dfrac{\sigma_y / \sigma_{ycr}}{\sigma_x / \sigma_{xcr}}$, $k_2 = \dfrac{\tau_{xy} / \tau_{cr}}{\sigma_x / \sigma_{xcr}}$, $k_3 = \dfrac{\tau_{xy} / \tau_{cr}}{\sigma_y / \sigma_{ycr}}$

Notes:

① σ_{x1} and σ_{y1} are greater values of working stress acting on sides of plate panel along axes x and y, σ_{x2} and σ_{y2} are the lesser values of such stress, and σ_x and σ_y are to be taken as the average values of σ_{x1}, σ_{x2} and σ_{y1}, σ_{y2} respectively; τ_{xy} is the average shear stress, σ_{x1}, σ_{x2}, σ_{y1}, σ_{y2}, τ_{xy} are as shown in Table 1.5.9.4(1) of this Section.

② σ_{xcr}, σ_{ycr} and τ_{cr} are the elastically corrected critical buckling compressive stresses under uniaxial stress and critical buckling shear stress of plate panel along axes *x* and *y* respectively.

Section 6 CORROSION CONTROL FOR HULL STRUCTURES

1.6.1 General requirements

1.6.1.1 Effective means are to be taken for all ships to prevent excessive corrosion of hull members.

1.6.1.2 All seawater ballast tanks having boundaries formed by the hull envelope plating are to have an efficient protective coating, epoxy or equivalent, applied in accordance with the coating manufacturer's recommendation. Dedicated seawater ballast tanks of all types of ships of not less than 500 gross tonnage and double-side skin spaces arranged in bulk carriers of 150 m and over in length, as specified in SOLAS regulation II-1/3-2, are to be coated in accordance with IMO resolution MSC.215(82) on Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in All Types of Ships and Double-Side Skin Spaces of Bulk Carriers (PSPC).

1.6.1.3 For bulk carriers, all internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of cargo holds, excluding the flat tank top areas and the hopper tanks sloping plating approximately 300 mm below the side shell frame and brackets, are to use an efficient protective coating (epoxy coating or equivalent) recommended by the coating manufacturer. In the selection of coatings, due consideration is to be given by the Owner to the intended cargo conditions expected in service.

1.6.1.4 Right before application of coatings to any structure, surface preparation is to be made in accordance with coating manufacturer's workmanship requirements and the surfaces are to be thoroughly cleaned to a corresponding degree. The number of coatings and total dry film thickness are to comply with the design requirements.

1.6.1.5 Where bimetallic connections are made, measures are to be incorporated to preclude galvanic corrosion.

1.6.1.6 Impressed current systems are not permitted in oil cargo tanks.

1.6.2 Primers or coatings

1.6.2.1 Where a primer is used to coat steel during construction, the primer is to be applied right after surface preparation. The composition of the primer is to be such that it will have no significant deleterious effect on subsequent welding work and that it is compatible with the paints or other coatings subsequently applied in association with an approved system of corrosion control for structures. Primers are subject to approval in accordance with the relevant CCS requirements.

1.6.3 Internal cathodic protection in tanks

1.6.3.1 Where a cathodic protection system is to be fitted in tanks or adjacent tanks carrying liquid cargoes having a flash point not exceeding 60℃, a plan showing details of the locations and attachment of anodes is to be submitted for information.

1.6.3.2 When cathodic protection requirements are assessed, the effects of uncoated surfaces (e.g. tank fittings) adjacent to those which require protection are to be taken into account.

1.6.3.3 Aluminium alloy sacrificial anodes, magnesium alloy sacrificial anodes, zinc and zinc alloy sacrificial anodes of oil tankers

(1) Aluminium alloy sacrificial anodes are permitted in tanks used for the carriage of oil and adjacent tanks, but only at locations where the potential energy does not exceed 28 kg•m (200 lb•ft). The weight of the anode is to be taken as the weight at the time of fitting, including any inserts and fitting devices.

(2) The height of the anode is, in general, to be measured from the bottom of the tank to the centre of the anode. Where the anode is located on horizontal surfaces (such as bulkhead girders and stringers) not less than 1 m wide, provided with an upstanding flange or face plate projecting not less than 75 mm above the horizontal surface, the height of the anode may be measured above that surface.

(3) Aluminium anodes are not to be located under tank hatches or Butterworth openings (in order to avoid any metal parts falling on the fitted anodes), unless protected by adjacent structure.
(4) Magnesium alloy sacrificial anodes are not permitted in oil cargo tanks and tanks adjacent to cargo tanks.
(5) Zinc and zinc alloy sacrificial anodes may be located in any position without restriction.
1.6.3.4 Arrangement of sacrificial anodes
(1) Anodes are to be reasonably located in relation to the structural features of the surfaces protected, and particular attention is to be given to the effects of adjacent structures and openings of the tank.
(2) Anodes are to be fitted with steel cores which are to be so designed as to retain the anode even when the latter is wasted. Anodes are to be sufficiently rigid to avoid resonance in the anode support.
(3) Anodes are to be efficiently attached to the structure. The following methods of attachment would be acceptable:

① steel core connected to the structure by continuous welding of adequate section;
② steel core bolted to separate supports, provided that a minimum of two bolts with lock nuts is used at each support;
③ approved means of mechanical clamping.

(4) Sacrificial anodes in tanks are not to be attached to the shell. The two ends are not to be attached to separate members which are capable of relative movement.
(5) Sacrificial anodes are to be attached to stiffeners, or may be aligned in way of stiffeners on plane bulkhead plating. Where cores or supports are welded to the structure, they are to be arranged so that the welds are clear of stress raisers. Where they are welded to asymmetrical stiffeners, they are to be connected to the web with the welding kept at least 25 mm away from the edge of the web. In the case of stiffeners or girders with symmetrical face plates, the connection may be made to the web or to the centreline of the face plate but well clear of the free edges. However, it is recommended that anodes be not fitted to face plates of higher tensile steel longitudinals in so far as practicable.

1.6.4 External hull protection

1.6.4.1 Shell plating, particularly the portion between light and loaded load lines, weather decks and hatch covers are to be provided with suitable corrosion protection.
1.6.4.2 Where an impressed current cathodic protection system is fitted, plans or information showing the proposed layout of anodes, reference electrodes, wiring and methods of attaching to the rudder and propeller, are to be submitted.
1.6.4.3 A small cofferdam is to be included in the arrangements for glands, where cables pass through the shell. Cables to anodes are not to be led through tanks intended for the carriage of low flash point oils. Where cables are led through cofferdams or clean ballast tanks of tankers, they are to be enclosed in a substantial steel tube of at least 10 mm thickness.
1.6.4.4 For ships subject to in-water survey instead of drydocking survey, the underwater portion of the hull is to be coated with a high resistant paint. Details of the high resistant paint are to be submitted to CCS for information.

1.6.5 Corrosion allowance

1.6.5.1 Unless otherwise stated in this PART, the scantlings of hull structural members calculated in accordance with this PART are to include the values of corrosion allowance t_c as specified here.
1.6.5.2 Corrosion allowances t_c of hull structural members, including plating and framing, are to be obtained as in Table 1.6.5.2.

Value of Corrosion Allowance t_c **Table 1.6.5.2**

Thickness t (mm)	Corrosion allowance t_c (mm)
≤ 10	1.5
> 10	0.1 t + 0.5, maximum 3.2

1.6.5.3 For boundaries of ballast spaces or cargo tanks, the corrosion allowance is not to be less than 2.5 mm.
1.6.5.4 For dry spaces (cargo spaces in bulk carriers excluded), the corrosion allowances is to be 0.5 t_c (see Table 1.6.5.2), but not less than 1.0 mm.

Section 7 FORE DECK FITTINGS

1.7.1 Strength requirements for fore deck fittings and equipment

1.7.1.1 This Section provides strength requirements for the following items located within the forward 0.25*L*: air pipes, ventilator pipes and their closing devices. However, these requirements do not apply to the cargo tank venting systems and the inert gas systems of oil tankers.

1.7.1.2 All ships of 80 m or over in length, where the height of the exposed deck in way of the items as defined in 1.7.1.1 of this Section is less than 0.1*L* or 22 m above the summer load waterline, whichever is the lesser, are to comply with the relevant requirements of 1.7.1 of this Section.

1.7.1.3 The pressures *p*, acting on air pipes, ventilator pipes and their closing devices may be calculated from:

$$p = 0.5\,\rho\, V^2 C_d C_s\, C_p \quad \text{kN/m}^2$$

where:

ρ — density of seawater, taken as 1.025 t/m^3;

V — velocity of water over the fore deck, in m/s;

= 13.5 m/s, for $h \le 0.5h_1$;

$= 13.5\sqrt{2(1-\frac{h}{h_1})}$ m/s, for $0.5h_1 < h < h_1$;

where: h — distance from summer load waterline to exposed deck, in m;

h_1 — 0.1*L* or 22 m, whichever is the lesser;

C_d — shape coefficient, taken as 0.5 for pipes, 1.3 for air pipe or ventilator heads in general, 0.8 for an air pipe or ventilator head of cylindrical form with its axis in the vertical direction;

C_s — slamming coefficient, taken as 3.2;

C_p — protection coefficient, taken as 0.7 for pipes and ventilator heads located immediately behind a breakwater or forecastle, 1.0 elsewhere and immediately behind a bulwark.

1.7.1.4 Forces acting in the horizontal direction on the pipe and its closing device may be calculated from 1.7.1.3 of this Section using the largest projected area of each component.

1.7.1.5 The requirements of 1.7.1.5 to 1.7.1.12 are additional to IACS UR P3 and UI LL36. This does not mean that closing devices of air pipes on all existing ships need to be upgraded to comply with UR P3.

1.7.1.6 Bending moments and stresses in air and ventilator pipes are to be calculated at critical positions: at penetration pieces, at weld or flange connections, at toes of supporting brackets. Bending stresses in the net section are not to exceed 0.8 R_{eH}, where R_{eH} is the specified minimum yield stress or 0.2% proof stress of the steel at room temperature. Irrespective of corrosion protection, a corrosion addition to the net section of 2.0 mm is then to be applied.

1.7.1.7 For standard air pipes of 760 mm height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in Table 1.7.1.7. Where brackets are required, three or more radial brackets are to be fitted. Brackets are to be of gross thickness 8 mm or more, of minimum length 100 mm, and height according to Table 1.7.1.7 but need not extend over the joint flange for the head. For air pipes of other heights, relevant requirements specified in 1.7.1.5 to 1.7.1.8 of this Section are to be met. Bracket toes at the deck are to be suitably supported.

760 mm Air Pipe Thickness and Bracket Standards **Table 1.7.1.7**

Nominal pipe diameter (mm)	Minimum fitted gross thickness (mm)	Maximum projected area of head (cm^2)	Height① of brackets (mm)
40③	6.0	–	520
50③	6.0	–	520
65	6.0	–	480
80	6.3	–	460
100	7.0	–	380
125	7.8	–	300
150	8.5	–	300
175	8.5	–	300
200	8.5②	1900	300②
250	8.5②	2500	300②
300	8.5②	3200	300②
350	8.5②	3800	300②
400	8.5②	4500	300②

Notes: ① Brackets (see 1.7.1.7) need not extend over the joint flange for the head.

② Brackets are required where the as-fitted (gross) thickness is less than 10.5 mm, or where the tabulated projected head area is exceeded.

③ Not permitted for new ships.

④ For air pipes of other heights, requirements specified in 1.7.1.5 to 1.7.1.12 of this Section are to be met.

1.7.1.8 For other configurations, loads according to 1.7.1.3 and 1.7.1.4 of this Section are to be applied, and means of support determined in order to comply with the requirements of 1.7.1.6 of this Section. Brackets, where fitted, are to be of suitable thickness and length according to their height. Pipe thickness is not to be taken less than as indicated in IACS UI LL36.

1.7.1.9 For standard ventilators of 900 mm height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in Table 1.7.1.9. Brackets, where required, are to be as specified in 1.7.1.7 of this Section.

900 mm Air Pipe Thickness and Bracket Standards **Table 1.7.1.9**

Nominal pipe diameter (mm)	Minimum fitted gross thickness (mm)	Maximum projected area of head (cm^2)	Height of brackets (mm)
80	6.3	–	460
100	7.0	–	380
150	8.5	–	300
200	8.5	550	–
250	8.5	880	–
300	8.5	1200	–
350	8.5	2000	–
400	8.5	2700	–
450	8.5	3300	–
500	8.5	4000	–

Note: For ventilators of other heights, requirements specified in 1.7.1.5 to 1.7.1.12 of this Section are to be met.

1.7.1.10 For ventilators of height greater than 900 mm, brackets or alternative means of support are to be fitted. Pipe thickness is not to be taken less than as indicated in IACS UI LL36.

1.7.1.11 All component parts and connections of the air pipe or ventilator are to be capable of withstanding the loads defined in 1.7.1.3 and 1.7.1.4 of this Section.

1.7.1.12 Rotating type mushroom ventilator heads are unsuitable for application in the areas defined in 1.7.1.1 and 1.7.1.2 of this Section.

1.7.2 Strength and securing of small hatches on the exposed fore deck

1.7.2.1 The provisions of this Section apply to the strength of, and securing devices for, small hatches fitted on the exposed deck over the forward 0.25 *L* ,where the height of the exposed deck in way of the hatch is less than 0.1 *L* or 22 m above the summer load waterline, whichever is the lesser, for all ships of 80 m or over in length. This regulation does not apply to small hatches on container ship giving access to a cargo hold which comply with UI LL64 except the requirement of clauses 4 & 5. Such hatch covers are considered non-weathertight regardless of whether it is actually weathertight or not. However, for scantlings of small hatches, the strength requirements in 1.7.2.4-1.7.2.7 of this Section could be applied instead of clause 6 of UI LL64.

1.7.2.2 Small hatches are hatches designed for access to spaces below the deck and capable of being closed weather-tight or watertight, as applicable. Their opening is normally 2.5 m^2 or less.

1.7.2.3 Hatches designed for emergency escape need not comply with the requirements of 1.7.2.8(1), 1.7.2.8(2), 1.7.2.9(3) and 1.7.2.10 of this Section. Securing devices of hatches designed for emergency escape are to be of a quick-acting type (e.g., one action wheel handles are provided as central locking devices for latching/unlatching of hatch cover) operable from both sides of the hatch cover. The maximum force needed to open the securing device is not to exceed 150 N, and the use of a spring equalizing, counterbalance or other suitable device on the hinge side to reduce the force needed for opening such hatch covers is acceptable. These requirements apply to new vessels, contracted for construction on or after 1 July 2007, by the time of delivery; to vessels contracted for construction prior to 1 July 2007, by the compliance date specified in 5.3.5 of Chapter 5, PART ONE of the Rules, or by the due date of the first special survey after 1 July 2007, whichever is later. Completion prior to 1 July 2007 of a special survey with a due date after 1 July 2007 cannot be used to postpone compliance.

1.7.2.4 For small rectangular steel hatch covers, the plate thickness, stiffener arrangement and scantlings are to be in accordance with Table 1.7.2.4 and Figure 1.7.2.4. Stiffeners, where fitted, are to be aligned with the metal-to-metal contact points, as required in 1.7.2.9(1) of this Section, see Figure 1.7.2.4. Primary stiffeners are to be continuous. All stiffeners are to be welded to the inner edge stiffener, see Figure 1.7.2.9 .

Scantlings for Small Steel Hatch Covers on Fore Deck **Table 1.7.2.4**

Nominal size (mm×mm)	Cover plate thickness (mm)	Primary stiffeners	Secondary stiffeners
		Flat bar (mm × mm); number	
630 × 630	8	–	–

Nominal size (mm×mm)	Cover plate thickness (mm)	Primary stiffeners	Secondary stiffeners
		Flat bar (mm × mm); number	
630 × 830	8	100 × 8; 1	–
830 × 630	8	100 × 8; 1	–
830 × 830	8	100 × 10; 1	–
1030 × 1030	8	120 × 12; 1	80 × 8; 2
1330 × 1330	8	150 × 12; 2	100 × 10; 2

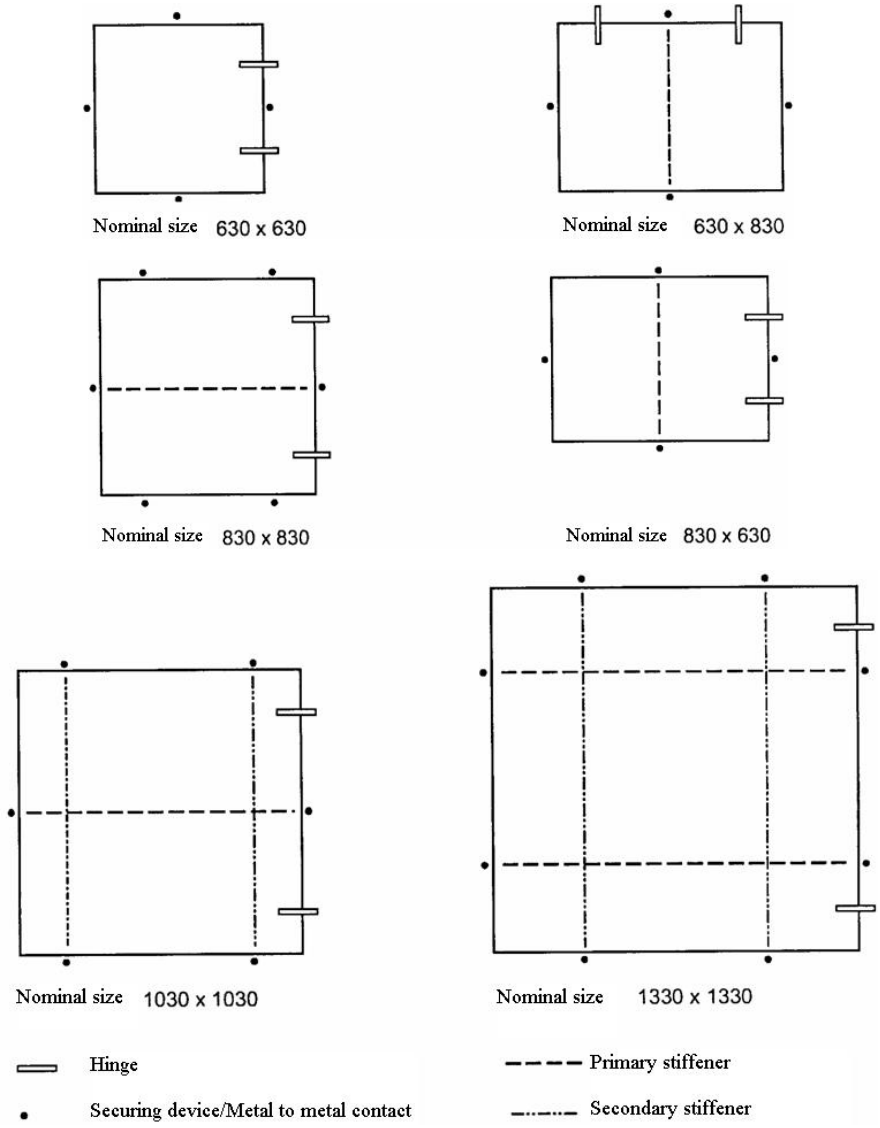

Figure 1.7.2.4 (Unit: mm × mm)

1.7.2.5 The upper edge of the hatchway coamings is to be suitably reinforced by a horizontal section, normally not more than 170 to 190 mm from the upper edge of the coamings.

1.7.2.6 For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement is to provide strength equivalent to that of the surrounding structure.

1.7.2.7 For small hatch covers constructed of materials other than steel, the required scantlings are to provide equivalent strength.

1.7.2.8 Small hatches located on exposed fore deck are to be fitted with any one of the following primary securing devices:

(1) butterfly nuts tightening onto forks (clamps);

(2) quick acting cleats; or

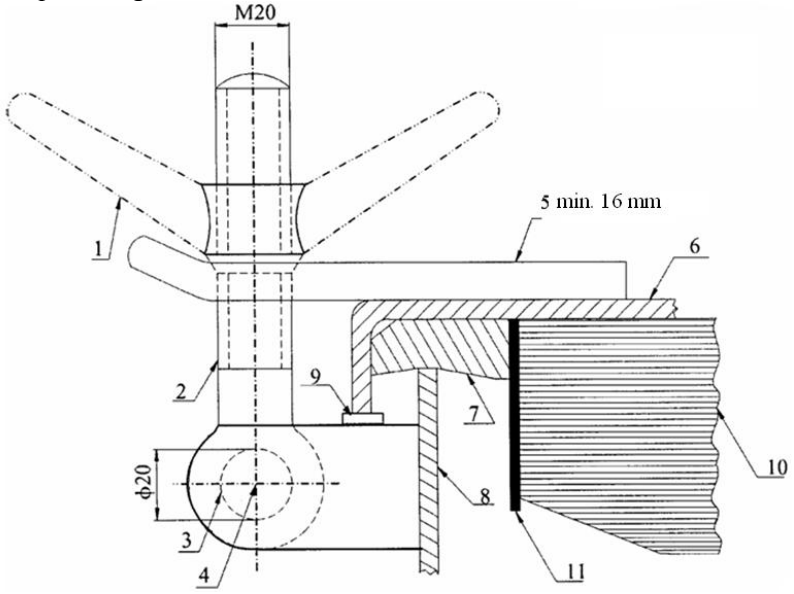
(3) central locking device.

Dogs (twist tightening handles) with wedges are not acceptable.

1.7.2.9 The following requirements are to be complied with for primary securing devices:

(1) The hatch cover is to be fitted with a gasket of elastic material. The metal-to-metal contacts are to be arranged close to each securing device in accordance with Figure 1.7.2.4, and of sufficient capacity to

withstand the bearing force. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged.
(2) The primary securing devices are to be designed and manufactured such that the designed compression pressure is achieved by one person without the need of any tools.
(3) For a primary securing device using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of forks is not to be less than 16 mm. An example arrangement is shown in Figure 1.7.2.9 .
(4) For small hatch covers located on the exposed deck forward of the fore-most cargo hatch, the hinges are to be fitted such that the predominant direction of green sea will cause the cover to close, which means that the hinges are normally to be located on the fore edge.
(5) On small hatches located between the main hatches, for example between No.1 and No. 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.



1. butterfly nut; 2. bolt; 3. pin; 4. center of pin; 5. fork (clamp) plate; 6. hatch cover; 7. gasket; 8. hatch coaming; 9. bearing pad welded on the bracket of a toggle bolt for metal to metal contact; 10. stiffener; 11. inner edge stiffener

Figure 1.7.2.9

1.7.2.10 Small hatches on the fore deck are to be fitted with an independent secondary securing device e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

Section 8 TANK SLOSHING

1.8.1 General requirements

1.8.1.1 For partially loaded tank, a strength assessment of tank structure under sloshing loads (hereinafter referred to as 'Sloshing Assessment') is to be carried out according to the requirements of this Section.
1.8.1.2 For those not covered by this Section, the requirements of CCS Guidelines for Assessment of Sloshing Loads and Structural Scantling of Tanks are to be met.
1.8.1.3 Unless otherwise specified, for tanks with internal members, partial filling generally means the liquid filling height is greater than 10% of the tank depth but less than 90% of the tank depth. For smooth tank, partial filling generally means the liquid filling height is greater than 5% of the tank depth but less than 95% of the tank depth.
1.8.1.4 Unless specially specified, the sloshing assessment specified in this Section includes both transverse and longitudinal sloshing motions.
1.8.1.5 According to the judgment of the sloshing resonance of ship and tank, the sloshing motion and loads are divided into levels 1, 2 and 3. For tanks complying with sloshing motion level 1, sloshing loads at

sloshing motion level 1 are to be calculated. For tanks complying with sloshing motion level 2, sloshing loads at sloshing motion levels 1 and 2 are to be calculated. For tanks complying with sloshing motion level 3, sloshing loads at sloshing motion levels 1, 2 and 3 are to be calculated.

1.8.1.6 In order to reduce sloshing motion level, internal members may be added for swash or limit on the filling may be taken to avoid sloshing resonance.

1.8.2 Application

1.8.2.1 This Section is applicable to tankers such as oil tankers, chemical tankers, liquefied gas carriers, and bulk carriers, ore carriers and dry cargo carriers etc.

1.8.2.2 This Section is applicable to all cargo tanks, ballast tanks and other tanks where free surface motion is allowed.

1.8.2.3 For ships the length of which is less than 100 m, the level 3 longitudinal sloshing assessment is not to be considered if the tank effective sloshing length does not exceed 0.16 L during the sloshing assessment. If the tank effective sloshing breadth does not exceed 0.6B (B is the ship breadth), level 3 transverse sloshing assessment is not to be considered.

1.8.2.4 Longitudinal sloshing assessment may not be required for tanks meeting one of the following conditions:

(1) the length of ship is less than 65 m and the effective sloshing length does not exceed 0.13L;

(2) the effective sloshing length is less than 0.03L.

1.8.2.5 Transverse sloshing assessment may not be required for tanks meet one of the following conditions:

(1) the length of ship is less than 65 m and the effective sloshing breadth does not exceed 0.56B;

(2) the effective sloshing breadth is less than 0.32B.

1.8.2.6 Sloshing assessment may not be required for tanks meet one of the following conditions:

(1) tank capacity is not greater than 100 m^3;

(2) tanks fitted in double bottom or double skin or other tanks of cellular construction;

(3) dry cargo holds used for ballasting of bulk carriers.

1.8.3 Plans and documents

1.8.3.1 Plans approved by CCS including tank boundary structure plan, internal member structure plan of tank (if any) are to be submitted during the sloshing assessment carried out in accordance with the requirements of this Section.

1.8.3.2 Sloshing loads and hull structural strength assessment report are to be submitted to CCS for information.

1.8.4 Sloshing loads calculation

1.8.4.1 Unless otherwise specified, the sloshing motion and the calculation of the loads specified in this Section are to meet the requirements of CCS Guidelines for Assessment of Sloshing Loads and Structural Scantling of Tanks.

1.8.4.2 The results of sloshing model test may be taken as the alternative for sloshing design loads when approved by CCS.

1.8.5 Strength assessment

1.8.5.1 Scantling assessment under sloshing loads are to be carried out to the following structural members:

(1) plating forming tank boundaries, stiffeners;

(2) plating and stiffeners on wash bulkheads in the tank;

(3) web of primary support members, web stiffeners in the tank.

1.8.5.2 Unless otherwise specified, scantling assessment under sloshing loads is to meet the requirements of CCS Guidelines for Assessment of Sloshing Loads and Structural Scantling of Tanks.

Section 9 INTACT STABILITY

1.9.1 General requirements

1.9.1.1 Compliance with the requirements for intact stability is a condition for classification of ships.

1.9.1.2 The intact stability of ships is to comply with the requirements of this Section, or it is to be demonstrated that their intact stability is in compliance with the requirements of the flag State Administration.

1.9.1.3 All bulk carriers of less than 150 m in length are to be fitted with loading instruments capable of providing intact stability information and are to comply with the requirements of Appendixes 1 and 2 of Chapter 2 of this PART.
1.9.1.4 Onboard computers for stability calculation, where fitted, for all ships are to comply with the requirements of Appendixes 1 and 2 of Chapter 2 of this PART.
1.9.1.5 If class notation SGISC(X) is applied for, the provisions of 1.9.6 in this Section are to be complied with, where X means one or more suffixes, the meanings of which are as follows:

PR_N——parametric rolling failure mode;

PL_N——pure loss of stability failure mode;

EA_N——excessive acceleration failure mode;

DS_N——dead ship condition failure mode;

SRB_N——surf-riding/broaching failure mode.

Where: N=1, meaning all loading conditions in compliance with Level 1 vulnerability criteria; N=2, meaning all loading conditions in compliance with Level 2 vulnerability criteria; N=M, meaning that there are loading conditions which do not meet the vulnerability criteria, and information on the stability of ship in waves has been prepared for the master.
